The features of the A. O. itself may be briefly stated to be constant fogs, baffling currents, innumerable icebergs, and magnificent manifestations of the Aurora Australis. On the coast of Victoria Land, beyond the parallel of 70°, two mountains have been observed to be of a height altogether unequalled in such a latitude—Mt. Terror, of 10,000 feet, and Mt. Erebus, of 12,400. The latter is a volcano, being, it is apprehended, the only phenomenon of the kind in either of the frigid zones.

Of the two circumpolar oceans, the southerly one has excited much less interest than the northerly. The open passages round the two capes respectively into the Indian Ocean and the Pacific, have, from the very beginning, rendered unnecessary any such voyages as those which, for nearly three centuries, have developed so much patience and fortitude in the heroic explorers of the Arctic shores.

ANT-BEAR. See ANT-EATER.

ANT-CATCHER and ANT-THRUSH, names given to birds of tropical and sub-tropical countries, which feed chiefly upon ants. They are closely allied to the Thrushes (see THRUSH), and are included with them in the family *Turdidæ* or *Merulidæ* of recent ornithologists. They are distinguished by a straight sub-cylindrical strong bill, hooked at the tip, slender legs, and very short tails. They form the genus *Myothe'ra* of Illiger, now subdivided into several genera, one of which, *Pitta*, contains the *Brèves* of Buffon—birds of brilliant plumage, natives of the south-eastern parts of Asia and the Malayan Archipelago. The true ant-catchers are mostly American, are of comparatively sober plumage, live among the huge ant-hills, seldom fly, and are remarkable for their sonorous voices, the power of which in some species is extraordinary. The largest species, known as the *King of the Ant-catchers* (*Grallaria Rex*), is about the size of a quail. Its legs are remarkably long.

ANT-EATER (*Myrmecophaga*), a genus of South American quadrupeds belonging to the natural order *Edentata*. The species are few. They are perfectly toothless, their food being insects, and particularly ants, which they procure in great numbers by thrusting among them a very long cylindrical tongue, covered with a viscid saliva, and then retracting it into the mouth. The head is remarkably elongated, with a slender muzzle, and a small mouth. The tongue is doubled up in the mouth when not in use for catching prey. The ears and eyes are very small. The toes differ in number in the different

Great Ant-eater (*M. jubata*).

species, but are united as far as the base of the claws, which are very large and strong, adapted to tearing up the habitations of ants. The Great A.-E. (*M. jubata*), a native of the warm parts of South America, and called in Demerara the A.-bear, is about 4½ feet in length from the snout to [illegible] of the tail, which is more than 2 feet l[illegible] covered with very long hair. The bo[illegible] covered with long hair, particularly alo[illegible] and back. There are four claws on each [illegible] feet, and five on the hind ones. The A.-[illegible] much of its time in sleep, the long snout [illegible] in the fur of the breast, the hind and [illegible] locked together, and the bushy tail thro[illegible] as if for a shade from the sun. It is [illegible] in its habits, and is regarded as a very st[illegible] It has great strength in its fore-legs and cl[illegible] is said to hug like the bear, so as to crush an [illegible] to death. The female produces one you[illegible] birth, and carries it about for some time [illegible] —Another species, the Tamandua [illegible] having the same number of claw[illegible] gated snout, comparatively shor[illegible] hensile tail, is scarcely so large as [illegible] trees in quest of its insect food.—T[illegible] L toed A.-E. (*M. didactyla*) differs from [illegible] not only in the number of its toes, but i[illegible] anatomical characters.—Closely allied to [illegible] in structure and habits is the genus *Ma*[illegible] ing the PANGOLINS of Africa and India: [illegible] of hair, the body is covered with [illegible] scales. See PANGOLIN.—The name A.-[illegible] at the Cape of Good Hope to the *O*[illegible] *Capensis*, the Aard-vark or Earth-hog of colonists, a quadruped of about the same [illegible] the great A.-E. of America, belonging to natural order, and resembling it also in its muzzle and extensile tongue, which [illegible] the same way, but provided with gri[illegible] flat claws adapted for burrowing. I[illegible] extraordinary facility, and it is in this [illegible] seeks to secure its safety when assailed. short hair, and little of it. The ears are [illegible] long. It is a nocturnal animal, and very [illegible] The *Echidnæ* of New Holland are some[illegible] Porcupine Ant-eaters, from their food similarity to the true ant-eaters in their and extensile tongue; but they differ parts of their structure. See ECHIDNA.

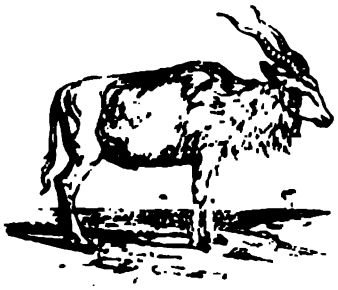
ANTECE'DENT, a term in Logic, G[illegible] and Mathematics. Thus we call a prope[illegible] Logic from which another is deduced, or a principle which serves as the base and [illegible] some particular proposition, the A. [illegible] the A. is the word which precedes the [illegible] for example, 'The *man* who dies for [illegible] should be held in honour.' Here 'man [illegible] In Mathematics, we speak of the A. of [illegible] i. e., the first of two terms which com[illegible] ratio. Thus, in the ratio of 4 to 3, 4 is the [illegible] word is also used in the plural in a peculia[illegible] 'We know very little of his *antecedents*'—i. e., previous character or conduct.

ANTEDILU'VIAN is the word used to [illegible] whatever existed before the Flood. The [illegible] are those which elapsed before the Flood, and theological language, the A. religion means religion of the patriarchs from Adam to Noah. Geology, the 'A. period' has no reference to deluge recorded in the Mosaic narrative, to the final transformation of the ea[illegible] of water.

A'NTELOPE (*Antilope*), a gen[illegible] belonging to the order of Ruminan[illegible] the hollow-horned section of that order. the horns consist of an elastic sheath surro[illegible] bony process of the skull, and are perma[illegible] annually renewed. The antelopes have [illegible] nucleus of the horns solid, not occupied, [illegible] of goats, sheep, and oxen, to a considerable

lls communicating with the frontal sinuses. e also distinguished from the allied genus of y having the chin beardless, and from them sep by the horns not being longitudinally ar ridged. The horns of antelopes are, how- ry generally annulated, or surrounded with ad ri The body is slender and deer-like, ad elegant, the tail short and tufted, y short, and the colour often lively. , however, have comparatively long a few which inhabit cold mountainous are clothed with wool intermixed with longer ner hair, particularly the CHAMOIS (q. v.) of , Caucasus, &c.; the ROCKY MOUNTAIN GOAT f North America; and the CHIRU (q. v.) of alayas. Many species have infra-orbital or *tear-pits* (q. v.) like deer. The females species, as of deer, are destitute of horns; hey alone came under observation, it would cult to say to which genus they belonged. is very various; the Guevei or Pigmy A. of *A. pygmæa*) is only 8 to 9 inches high at the whilst the largest species measure 5 or 6 st all the species of antelopes are peace- animals, and are distinguished by their nd fleetness. Most of them are gregarious. habit plains; others are found only in the ccessible mountainous regions; whilst others jungles and deep forests. North America two or three species, which depart consider- loss the chamois of Europe, from the of the genus. Europe produces mois and the Saiga (*A. Saiga*), the *Colus* bo, which inhabits the southern plains of and Russia. Asia has a greater number of but they are most numerous in Africa, and arly in South Africa. The known species to more than eighty, which are arranged in or groups according to the peculiarities of and other characters, but a satisfactory on of them is difficult. Some naturalists family of *Antilopeæ*, and subdivide it into but they are not separated by sufficiently characters. The flesh of all antelopes is used ; hence they are much objects of the chase. rnish also great part of the subsistence of of prey in Africa, where some of the species such numbers that, particularly when severe occurs in the regions which they ordi- abit, dense and multitudinous herds occa- appear in the interior of Cape Colony, to rible devastation of the crops. Even the f the Tatarian plains congregate in herds of usands in the end of autumn.

ame A. is sometimes more particularly d to a species also known as the Common or A., and as the Sasin. It is a native of India eastern parts of Asia, and is a beautiful about 2½ feet high at the shoulder, with iverging horns, bent in a spiral of two or rns. The hair is uniformly short, except in many other species of A., there are w of bristles on the knees. It inhabits ns, and the herds exercise great watchful- Its fleetness is such that greyhounds chase it and it can easily bound over an enclosure of n height, or over a distance of 10 or 12 yards. h is held in small esteem, and the animal is n many of its congeners an object of the The Saiga is a much less graceful animal; s are short, and, as in many of this genus, irst outwards and then inwards, so that the utline formed by them resembles that of a hey are used by the Russians and Chinese manufacture of many articles of domestic ; and it is chiefly for their sake and that of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes.—The Dzeren (*A. gutturosa*), sometimes called the Chinese A., and known among the Chinese by a name which signifies the Yellow Goat, is an inhabitant of the arid deserts of Central Asia, the flesh of which is highly esteemed, and which is therefore a chief object of the chase in these regions. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by a dilatation of the larynx.—The Addax, or Nubian A. (*A. Addax*), which was known to the ancients, and is



Addax (*A. Addax*).

mentioned by Pliny, has horns very similar to those of the Indian A., but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of Central Africa, and, contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The Chikara and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The chikara inhabits thick forests and jungles. Like the addax, it lives in pairs; as do also the Stein-boc (q. v.) of South Africa, an extremely graceful species; and the Kleene-boc of the same country (*A. pygmæa*), a beautiful and active little creature, with very small horns. The kleene-boc is of a mild and gentle disposition, and extremely capable of domestication. The Gazelle (q. v.) of North Africa (*A. Dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favourite objects of comparison. The South African SPRING-BOC (q. v.) is another very beautiful species, and is frequently domesticated by the colonists at the Cape of Good Hope. Among the numerous species which that country produces may be mentioned also the Blauw-boc (*A. leucophæus*); the Riet-boc (*A. arundinaceus*); and the Caffrarian ORYX (q. v.), (*A. Oryx*), which somewhat resembles, but is quite distinct from, the Oryx of the ancients (*A. Leucoryx* or *A. Gazella*), also called the Algazel, a native of the countries on both sides of the Red Sea. Still more worthy of notice among the South African species, but in some measure departing from the strict A. type, is the ELAND (q. v.), the largest of all the antelopes—an animal which may yet pro-

Head of Antilope Chikara.

bably be found very valuable in domestication. The KUDU (q. v.) is another noble species, allied to the eland. The NYL-GHAU (q. v.) of India, and the GNU (q. v.) of South Africa, are also among the largest antelopes, but depart still further from the generic type, particularly the latter, so that a separate genus (*Catoblepas*) has been constituted for it, having better claims to be recognised than the other genera into which it has been proposed that the antelopes should be divided. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the BUBALUS (q. v.) of the ancients, a native of the north of Africa, the Arabic name of which signifies wild ox, and the KAAMA (q. v.) or Harte-beest of the Cape of Good Hope, which is nearly allied to it. The PRONG-HORN (q. v.) and the ROCKY MOUNTAIN GOAT (q. v.) are the best known North American species; and both are found only in the western parts of the continent. It has been proposed to introduce the latter, as a wool-bearing animal, into the Highlands of Scotland.

ANTE'NNÆ, in Zoology, jointed filaments with which the heads of Insects, Crustacea, and Myriapoda are furnished, and which are evidently very delicate organs of touch. They are therefore sometimes called feelers. The name A. is derived from *ante*, before. The A. are placed on the anterior or superior part of the head; the animals appear to feel their way with them, and to them is ascribed the bee's power of working in the dark. Some suppose that they are also organs of hearing, and by means of them it would appear that many insects, as bees and ants, have the power of communicating with one another. They possess great flexibility, but differ very much in the number of joints which they contain (amounting sometimes even to 100), in the relative length and thickness of their joints, and also in their form, being filiform or thread-like, clavate or club-shaped, feathered, &c., in endless variety.

ANTEQUE'RA (the *Anticaria* of the Romans), an important town in the province of Andalucia, Spain, is situated in a fertile plain, 45 miles west of Granada. Pop. 30,000. The inhabitants are engaged chiefly in agricultural operations, but also manufacture baize, silk, cotton, and paper. They are noted for their love of bright colours in dress. Although A. is clean and well built, it is rarely visited by travellers, on account of its lying considerably off the high road. As late as 1544, the place possessed, in almost perfect condition, an ancient palace and theatre; but about that time the stones were plundered to build a convent, and only a few were spared, which are now imbedded in the walls of the town. A., like all the other cities of South Spain, was for a while in the hands of the Moors; but in 1410 it was retaken by the Regent Fernando, who is hence called *El Infante de A.* When the French took the place, during the Peninsular War, they converted a curious old mosque—a relic of Moorish sway—into a storehouse, and on their departure carried off with them the magnificent Moorish armoury.

ANTHE'LIA (Gr. *anti*, opposite, and *helios*, the sun; Ger. *Gegensonnen*) are luminous rings, seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a centre. When the sun shines brightly, and the fog is dense, as many as four concentric rings of

2. *Persian Anthologies.*—In the Persian literature, the best known works of this sort are *Taskarat al Shuara* (Lives of the Poets), by Daulet Shah (died 1495), the contents of which are to be found almost entire in Hammer's work on Persian *belles-lettres* (Vienna, 1818), and *Atesh Kedah* (the Fire Temple), by Haje-Lutf-Ali-Beg, who lived about 1770. Both works give biographical notices of the Persian poets: the first, in chronological order; the second, in topographical order, with specimens from their works. An A. of the best Persian poetry, arranged according to the subjects, is given in the *Medshua al Shuara* (a Collection of Poets).

3. *Tatar Anthologies.*—Of the poets who have written in the Tatar—i. e., the East Turkish or Tshagatai dialect—we possess a collection comprising 441 biographies, with specimens of their poetry: *Madshalis alnasais* (Charming Company), by Mir-Alischir (died 1500), and the *Lives of the Tatar Poets*, by Sadiki, extending down to the 17th c.

4. *Turkish Anthologies.*—The number of anthologies in the West Turkish, or, as it is generally called, the Turkish language, is very numerous. The most famous are—*Heshi Behesht* (the Eight Paradises), by Schi of Adrianople (died 1548); *Taskarat al Shuara* (Lives of the Poets), by Latifi (died 1582), and, under the same title, a similar work of Ashik Tshelebi (died 1571); and the great collection, *Subdat al-ashaar* (the Blossoms of Poetry), by Kassade (died 1621). The substance of these anthologies is to be found in Hammer's *History of West Turkish Poetry* (Pesth, 1836).

5. *Indian Anthologies.*—The literature of the Mohammedan population of Hindustan, which is a mere copy of Persian literature, has also several anthologies. The most important are *Gulzari Ibrahim*, by Ali Ibrahim, containing biographical notices of 300 Hindustani poets, with specimens of their writings; the collection called *Diwani Jihan*, by Beni-Narâyan; *Guldastai Nashât* (Garland of Pleasure), by Manu Lal (Calcutta, 1836); and *Guldastai Nâzsinân*, by Kerim-ed-din (Calcutta, 1845). The substance of these works is to be found in Garcin de Tassy's *Histoire de la Littérature Hindui et Hindustani* (Paris, 1839—1847), which, under the title of *Tabakâti Shuarâi Hindi*, was translated into Hindustani by Kerim-ed-din (Delhi, 1848). In the pure Hindi, we have a rich collection of songs, the *Râgel Sâgar*, by Krishnânanda (Calcutta, 1845).

6. *Sanscrit Anthologies.*—The Sanscrit literature is not so rich in anthologies as the other oriental literatures. If we do not consider the Vedic hymns, and the collections of poems which bear the general title *Sataka* (a Century), anthological in the proper sense, there is only one work of this kind known—viz., the *Paddhati*, by Sarngadhara, towards the close of the 14th c., in which are gathered together 6000 detached strophes of the most famous epic, lyric, and dramatic poets of India, arranged under certain heads.

7. *Chinese Anthologies.*—From the earliest ages, the Chinese had the custom of sending, along with the yearly tribute to the emperor, copies of such songs as had acquired popularity. Confucius selected from a great number of these 311 of the most beautiful. These are preserved under the name *Shi-king* (Book of Songs), one of the canonical books of the Chinese. This is the oldest A. in the world. A Latin version, by Lacharme, was published at Stuttgart, 1830; a German one, by Ruckert, at Altona, 1833. Besides

this, there is *Tchao-ming-woen-siouen*, a collection of the finest poems of the time of the Liang dynasty (502—556 A. D.), and also *Thang-shi*, poems of the time of the Thang dynasty (618—914 A. D.).

ANTHON, CHARLES, LL.D., a well-known editor of classics, was born in the city of New York in 1797. At the age of 14, he entered Columbia College, where he pursued his studies with ardour and success for four years. Having been originally intended for the law, he now passed through a preliminary practical instruction in his brother's office, and in 1819 was admitted to the bar of the supreme court of the state of New York. His time, however, was chiefly devoted to classical literature, for which he soon began to acquire a high reputation; and in 1820, when only 23 years of age, he was appointed adjunct-professor of Languages in Columbia College, which office he held for fifteen years. He now commenced that series of classical publications which has done so much to make available for popular purposes the erudite researches of European scholars. His first work was a new edition of Lempriere's *Classical Dictionary*, which was almost immediately re-issued in England. In 1830 appeared his larger edition of Horace, quite a novelty in its way, on account of the superabundant English notes which accompanied the text. In 1833, he issued a smaller edition, for the use of schools and colleges. Virgil, Cæsar, and other ancient writers have been illustrated in the same attractive manner. A.'s editions of the classics have acquired an extensive popularity; but scholars are disposed to regard them with a kind of learned aversion, both because of the temptations they present to the school-boy to overlook the difficulties of a knotty passage, and of the superfluous and often unimportant matter which is dignified with the title of 'commentary' or 'notes.' It cannot be doubted, however, that these works have given a healthy stimulus to the rudimentary study of the ancient authors. In 1831, A. received the degree of LL.D. from his Alma Mater. In 1835, he succeeded Professor Moore in the chair of languages. A. likewise published large works on ancient geography, Greek and Roman antiquities, mythology, literature, &c. He died July 29, 1867.

ANTHONY, ST. See ANTONY, ST.

ANTHOXANTHUM. See VERNAL GRASS.

A'NTHRACITE (Gr. *anthrax*, a coal), a mineral substance of the nature of coal, but consisting of carbon with a minimum amount of hydrogen. It is of a black colour, conchoidal fracture, and imperfectly metallic lustre (hence called *glance*-coal). It burns slowly, and without flame, and hence is sometimes called *blind*-coal. Its vegetable origin cannot be doubted. Where strata of common coal have been broken through by trap dikes, the coal next the trap is found to be A., with a gradual transition into the ordinary state; hence geologists look upon A. as natural coke (q. v.), formed by heat or other process from ordinary coal. A. is used as fuel like coke. It is applied in many places to the burning of lime and bricks, the reduction of iron, &c. It occurs extensively in Ireland, and in some of the coal-fields of England, Scotland, and the continent of Europe; but on the largest scale in the United States.

ANTHROPO'LATRY (Gr.), a term signifying, according to its derivation, the worship of man, and always employed in reproach. Thus, the early Christians accused the heathens of A., because, in their mythology, men were represented as exalted among the gods, although an *apotheosis* (q. v.) was in these cases alleged by their worshippers; and the heathens retorted the charge because of the worship of Christ; the reply to which was the assertion of his divinity. But the term is chiefly known in ecclesiastical history in connection with the employment of it by the Apollinarians (q. v.) against the orthodox Christians of the 4th and 5th centuries, with reference to the doctrine of the perfect human nature of Christ.

ANTHROPO'LOGY (from the Gr. [illegible] man), a term signifying that branch [illegible] which has man for its subject. In its proper [illegible] it is very comprehensive, and of course in[cludes] Anatomy, Physiology, Psychology, Ethnology, Theology, *Æsthetics*, &c. The word, of late, come into very common use. There [is] Anthropological Society in London; and a[n] anthropological section has been constituted [in the] British Association.

ANTHROPOMO'RPHISM (from the *thrōpos*, man, and *morphē*, a form), the application, figurative way, to God, of terms which properly to human beings. Thus, in the Holy Scriptures read of the eye, the ear, the arm, the [hand] and of his remembering, forgetting, [repenting] appears to arise of necessity from [the] forming conceptions of things spiritual, [except] terms in which to express them, except [those] derived from things cognizable by our senses; even the language of adoration is borrowed from familiar things of this world. It must be [observed], however, that A. employed in an unguarded [manner] or too grossly understood, might lead to most [serious] error; and a tendency has manifested itself at [various] times in the history of the Christian Church, to [attribute] to the Divine Being a form and parts [like] men. Thus, the Audæans (q. v.) [a] Syrian monastic sect which sprang up [in the 4th century] were accused, and, it would seem, justly, [of holding] that God was possessed of a human shape; when the Bible said that 'God created man in his own image,' the words are to be understood [in a] shape literally. The same error was also [falsely] ascribed to the Waldenses, but there is [reason to doubt] of the justice of the accusation. A tendency [to A.] may indeed be regarded as always existing, [and] requiring to be guarded against in the study of man; but the instances have been rare and extreme, although they have from time to time occurred in which anthropomorphite views have been [openly] adopted and openly expressed among Christians. The error of the anthropomorphites has, however, found countenance from the speculations of some philosophers. Hobbes, Forster, and Priestley ascribed to the Divine Being a sort of subtile body. Kant, on the other hand, rejected the very doctrine of the personality of the Divine Being as an anthropomorphism, and represented God as the moral order of the *universe;* and Schelling, Hegel, and Schleiermacher substituted for the ordinary personality of God a subjective consciousness in the human soul.—The term A. is also sometimes employed to denote the ascription to God of human affections and passions. In the most general sense, includes the [whole] of Scripture, in the many instances in which it must be interpreted according to the same principles which are applicable in those cases which are so called, with the same discrimination of the figurative from the literal, and the same due recognition of the absolute spirituality and unknowableness of God; yet so that [truth] conveyed by means of such [language] is probable could only be conveyed in such language, in accordance with [the] tion, may not be rejected or obscured [by] must be confessed, there is greater [danger] with regard to A. strictly so called.

ANTICHLORE is the name given to commer... sulphite of soda by paper-makers. When the ... are reduced to a pulp, they are bleached by ...ide of lime (bleaching-powder), which thoroughly ... the pulp, and is very difficult to wash out. ... traces of chlorine thus left in the pulp pass ... the manufactured paper, and tend to bleach ...rting-ink which may be traced thereon. To ... the pulp from the residue of the chlorine, some ... of soda is employed, and hence the name ..., which literally signifies 'against (*anti*) chlorine.'

ANTICHRIST (from Gr. *anti*, against, and *Christos*, Christ). The general notion of A., as a power opposing itself to the reign of the Messiah, may be traced back beyond the Christian era. Its origin is perhaps to be found in the prophecy of Ezekiel concerning the doom of Gog and Magog. In accordance with the old saying, 'When need is sorest, help is nearest,' the Jews conceived that, immediately previous to the Messiah's reign, national adversity must be experienced in an extreme degree, and that an agent of Satan would appear, who must be overcome before prosperity could be restored. This was A. The idea is adopted in the New Testament, although the term A. occurs in no place of Scripture, except in the First and Second Epistles of John. From such passages as the prophecies of the Saviour, Matt. xxiv. and Mark xiii., it has been inferred by some that probably the great truth which this conception was intended to shadow forth was similar to that illustrated in the life of 'the Man of Sorrows' that only through tribulation and strife could the reign of the Messiah be established, that Christ's kingdom, like Christ himself, could be made perfect only through suffering. And with this the language of John in his epistles, and of Paul in passages which seem to embody the same idea, is supposed to accord. Nor is it regarded as a fatal objection to this opinion, that in the Apocalypse the Antichristian power or element is associated with the great heathen capital Rome, symbolically designated Babylon.

But this opinion neither has been nor is generally prevalent. The idea of A. early became associated with that of the Millennium (q. v.), retaining a form very similar to that which it had among the Jews before the advent of the Messiah; and popular opinion has always sought to find for it some actual and definite embodiment. In the 5th c., a popular delusion prevailed, founded on the passage in the Apocalypse, xvii. 8, that Nero was not dead, and would return in the character of A. Since the 16th c., the prevalent opinion among Protestants has been that A. is the Roman Catholic Church; an idea entertained even at an earlier period, as, for instance, by Ludwig of Bavaria, regarding Pope John XXII., by Occam, Wickliffe and his pupil Cobham, and the Bohemian reformer Janow, and which seems to have prevailed to a considerable extent among the Hussites and other opponents of Rome. This opinion has of course been strenuously opposed by Roman Catholic writers, as by Bossuet, who, in his comments on the Apocalypse, ably advocates the opinion that Pagan Rome was A. The opinions of Roman Catholics, however, are much divided upon this subject, many of them maintaining that A. is yet to come and 'to raise the last persecution,' as 'no one has yet appeared to whom we can apply the character which the infallible Word of God declares shall be that of the real A.'—*Keenan's Catechism of the Christian Religion.*

The opinion prevalent among Protestants depends upon the identification of A. with the mystical Babylon of the Apocalypse, and with other symbolic representations in that book, of a power opposed to the cause of Christ, and also with the 'Wicked' one, the 'Man of Sin,' and 'Son of Perdition,' in 2d Thess. ii. Thus it is maintained that a definite embodiment of the idea of A. is to be sought in history, and that this is to be found in the Church of Rome or in the Papal power. And Protestants refer to the gradual growth and development of the errors which they regard as culminating in the Church of Rome, as accordant with the declaration of Paul in 2d Thess. ii., that 'the mystery of iniquity doth already work,' and with that of John, 'even now are there many antichrists.'

There have been, however, among Protestants eminent opponents of this opinion, among whom may be named Grotius. His own opinion was singular, that Caligula, the Roman emperor, was A. In the Greek Church, the term A. has been understood as especially applicable to Mohammed, or to the dominion of the Turks and Saracens. Almost every great or striking event—the arrival of the year 1000; the beginning of the Crusades; the 'black death' and other plagues in the 14th c.; the career of Napoleon in 1805; and even the political movements of 1848 and 1849—has suggested new interpretations of the passages of Scripture regarding A. See REVELATION OF ST JOHN.

ANTI-CORN-LAW LEAGUE, the name adopted by an association which concentrated the efforts of the free-trade party in Britain, and enabled them to carry the repeal of the corn-laws, and establish in practice the principle of free-trade. The results thus accomplished will have to be considered under other heads, as CORN-LAWS, FREE-TRADE, &c. This statement is limited to a brief account of the League itself, and its method of working. Associations to obtain the repeal of the corn-laws existed in several places before the embodiment of the League one especially was founded in London in 1834. In 1838, Mr Cobden and others took the opportunity of the periodical assemblages of the Manchester Chamber of Commerce for exposing the deleterious influence of the restrictive commercial policy on the manufactures and trade of the country. The friends of free-trade, at the same time, occasionally met in

Manchester to discuss and promulgate their views; but it was in the beginning of 1839 that the strength of the party was first drawn to a focus, by the appointment of delegates from the manufacturing districts to proceed to London, and press their principles on the legislature. Mr Charles Villiers, afterwards President of the Board of Trade, undertook the leadership of their cause in the House of Commons, of which Mr Cobden, who subsequently served it so effectively, was not then a member. On the 19th of February, Mr Villiers moved that the House resolve itself into a committee of inquiry on the corn-laws; and again, on the 12th of March, he moved that certain manufacturers be heard by council at the bar of the House against the corn-laws, as injurious to their private interest. The former motion was rejected by 342 to 195; the latter, by 361 to 172. Immediately on the return of the delegates from their unsuccessful effort, the League was formed. Its constitution dates from the 20th March 1839, when resolutions were adopted, at a meeting in Manchester, for 'the formation of a permanent union, to be called "The Anti-corn-law League," composed of all the towns and districts represented in the delegation, and as many others as might be induced to form anti-corn-law associations, and to join the League.

'Delegates from the different local associations to meet for business from time to time at the principal towns represented.

'With the view to secure unity of action, the central office of the League shall be established in Manchester, to which body shall be intrusted, among other duties, those of engaging and recommending competent lecturers, the obtaining the co-operation of the public press, and the establishing and conducting of a stamped circular, for the purpose of keeping a constant correspondence with the local associations.'

It was resolved that, in addition to the funds which local associations might provide for their own district purposes, £5000 should be put at the disposal of the central body, and that every person, or collection of persons, contributing £50, should have one vote in its deliberations. The League collected and distributed large sums of money. Just before its principles became triumphant in the free-trade legislation of 1846, it demanded a quarter of a million, which would have been supplied had it been necessary.

It is of the greatest moment that the cause of the success of the League should not be misunderstood: it triumphed not by possessing money, but by teaching a scientific truth. It was a great organisation for educating the country in political economy. The leading principles of this science were so little known when the League began, and had been so effectually promulgated before its end, that a majority of the parliament who, in 1841, had been elected for the support of protection, were converted to free-trade, the conversion including the prime-minister, Sir Robert Peel. The key-note to the literature of the League was struck by the beautiful logical exposition of free-trade in General Thompson's *Catechism of the Corn-laws*, which, with other tracts, was profusely dispersed over the country, while a large staff of lecturers aided in the task of education. Thinking to serve their cause in the same manner, the Protectionist party, at a meeting held in the Duke of Somerset's house, on 17th February 1844, founded 'The Agricultural Protection Society of Great Britain.' This body had inexhaustible wealth at command, but in reality its exertions only helped to further the cause of free-trade, by promoting discussion, and prompting people to work out the question for themselves.

TIGUA, a West India island, the most ant of the windward Caribbees (see ANTILLES), e residence of the governor-in-chief of the portion of the group. It lies in W. long., n 61° 44′ and 61° 58′; and in N. lat., between and 17° 13′. Its area was estimated, in 1870, 120 acres, of which about 100,000 were under ation. In 1871, the population of A. was yielding to a square mile an average of 318 inhabitants. It was first settled in having till then remained, in fact, unin- l on account of the great scarcity of fresh

It has twice suffered severely from earth- —in 1689 and 1843; while of hurricanes e other heavy scourge of the group, A. has full share. Numerous islets, rocks, and shoals the shore, so that, generally speaking, access ult and dangerous. But St John's, the chief stands at the head of a safe and capacious hich unfortunately, however, does not admit ssels. English Harbour is, on the whole, a ommodious port, and has been selected as the of the Royal Mail Steam-packets. It is said apable of receiving the larg st ships in the navy.

chiefly of tertiary formation. The south and ew grauwacke, porphyry, trap, breccia, amyg- and basaltic greenstone; the north and east calcareous marl and coarse sandstone, inter- with blocks of limestone; while the interior a argillaceous strata and irregular beds of flint.

les provisions, generally almost sufficient for consumption, A. produces large quantities of molasses, and rum. In this respect, the pation of the slaves appears to have been beneficial than otherwise. In 1871, the total e of vessels (exclusive of the coasting-trade) entered and cleared A. was 58,804; and of 3,274 were British, and the other 5530 foreign. tal value of imports (including bullion and was, in the same year, £175,741; of exports, same terms, £247,630. The sugar exported ted in value to £205,982. The value was, in 301,740; in 1863, £199,832; in 1867, £87,593. nnection generally with the emancipation of es, of whom immediately previous to the of slavery, A. had about 30,000, it seems occupied a prominently creditable position. tely after the passing of the imperial on the subject, the local legislature, reject- e intermediate and probationary state of ticeship, proclaimed unqualified freedom for gust 1834 –a bold measure, which proved to ndicious as it was humane.

TLLES, a term used to designate generally le of the West India Islands, except the . Generally speaking, they stretch east- rom the Gulf of Mexico to about the meri- f the Gulf of Paria; then southward to the f Paria itself; and lastly, westward to the f Maracaybo. Primarily, however, they are d not as three sections, but as two - the r A., to the north and west; and the Lesser, to the east and the south. This distinction, which obviously involves considerations of position as well as of magnitude, will be found to indicate also a difference of organic structure.

The Greater A., reckoning from the west, are: Cuba (Spanish), Jamaica (British), Hayti (independent), and Porto Rico (Spanish). They extend, in W. long. from 84° 58′ to 65° 40′, and in N. lat. from 23° 9′ to 17° 40′—the higher of these two parallels being only 21′ or about 25 miles within the Tropic of Cancer. On the lowest estimate, the area is said to amount to 70,000 square miles. The Greater A. appear to be of primitive formation, presenting lofty granitic mountains. In Jamaica, however, there are many hills of calcareous origin.

The Lesser A. may be divided into two chains—the eastern, trending round from the eastward of Porto Rico to the Gulf of Paria; and the southern, stretching away in a direction nearly parallel with that of the Greater A., along the coast of Venezuela as far as the Gulf of Maracaybo. With reference to the prevailing trade-wind, these two chains are respectively designated the Windward and the Leeward Islands.

The Windward Islands, reckoning from the north, come in pretty nearly the following order: Virgin Islands (Danish and British), Anegada (British), Anguilla (British), St Martin (French and Dutch), St Croix (Danish), Saba (Dutch), St Bartholomew (Swedish), St Eustatius (Dutch), Barbuda (British), St Christopher's (British), Nevis (British), Antigua (British), Montserrat (British), Deseada (French), Guadaloupe (French), Marie Galante (French), Dominica (British), Martinique (French), St Lucia (British), Barbadoes (British), St Vincent (British), Grenadines (British), Grenada (British), Tobago (British), Trinidad (British). They extend in W. long. from 65° 30′, at the west extremity of the Virgin Isles, to 59° 20′, at the east extremity of Barbadoes; and in N. lat. from 18° 48′, at the north extremity of Anegada, to 10° 31′, at the south extremity of Trinidad. The entire area perhaps scarcely equals 5000 square miles, being not materially larger than that of Jamaica alone. The Windward Islands are otherwise called the Caribbees, from the now extinct race of the Caribs (q. v.); and hence the sea, which they cut off from the open Atlantic, has taken the name of Caribbean.

The Leeward Islands, reckoning from the east, may be given as follow: Testigos (Venezuelan), Margarita (Venezuelan), Tortuga (Venezuelan), Blanquilla (Venezuelan), Buen Ayre (Dutch), Curaçoa (Dutch), Aruba (Dutch). They extend in W. long. from 63° 12′, at the east end of the Testigos, to 70° 11′ at the west end of Aruba; and in N. lat. from 11°, at the south of Margarita, to 12°, at the north of Curaçoa. Their entire area cannot exceed 1500 square miles.

The Lesser A., as a whole, appear to be chiefly of coral formation, or of volcanic origin. Many of them contain extinct craters; and, though not destitute of harbours, their coasts are rendered in a great measure inaccessible by reason of reefs.

The A. generally - but perhaps the Lesser more so than the Greater - are subject to hurricanes and earthquakes. Their principal productions are sugar, rum, cotton, coffee, &c. The individual islands will be found noticed more in detail in their respective places.

The name A. is generally supposed to have been given by mistake to the West Indian Islands. Before the discovery of America by Columbus, a tradition existed that far to the west of the Azores there lay a land called Antilla, whose position was vaguely indicated in the maps of the early cosmographers. Only eight months after Columbus's

return, we find one Peter Martyr writing that the islands which the great navigator had touched upon, must be the Antillæ; and it is certain that Cuba and Hayti were known as such before a single link in the Caribbean chain was discovered.

ANTILOPE. See ANTELOPE.

ANTIMONY (in Lat. *Stibium;* hence the chemical symbol *Sb*) is a brittle metal of a flaky, crystalline texture, and a bluish-white colour. It is readily reduced to powder by ordinary pulverisation; when heated to 840° F., it fuses, and thereafter being allowed to cool, it solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, A. volatilises as the vapour of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the teroxide of A., or 'flowers of A.' The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bismuth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, A. does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders A. of essential service in the useful arts, in the construction of alloys, such as Britannia metal, type metal, and plate pewter. It is likewise employed in the preparation of the large concave mirrors used in astronomical observations; and in the casting of bells, to make them harder and whiter, and to give them a clearer and stronger sound.

The principal natural sources of A. are—*grey* or *crude* A. of commerce, which is the impure tersulphuret of A. (SbS_3); and *native* A., in which it occurs in the metallic state associated with silver, iron, and other metals. The extraction of A. from its ores is mainly carried on at Linz, in Germany, where the sulphide of A. is found extensively, and in Great Britain, which receives its supply of ore from Singapore and Borneo, commonly as ballast. The process consists in heating the crude ore, covered with charcoal, on the bed of a furnace, when the sulphide of A. fuses, leaving unmelted the earthy impurities; and thereafter the liquid is drawn off into iron moulds, where it solidifies into cakes or loaves. The latter are reduced to coarse powder, placed on the bed of a reverberatory furnace, and heated with access of ordinary air containing oxygen, when the sulphur passes away as gaseous sulphurous acid (SO_2), leaving behind the A. as the teroxide (Sb_2O_3). The roasted mass is now mixed with one-sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda, and raised to bright redness in crucibles, when the metal A. trickles to the bottom, and the impurities are left above in the spent flux or scoria, which is known in the arts by the name of *crocus* of A.

The compounds of A. are numerous: with oxygen it forms (1) the *terasule* of A., or *white A. ore* (Sb_2O_3), which enters into the composition of tartar emetic; (2) *antimonious acid* (SbO_4), which forms one of the components of Dr James's powders; (3) *antimonic acid* (SbO_5), a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, A. forms the *tersulphide* (Sb_2S_3) already referred to as a natural ore of the metal, and which when roasted at a temperature sufficient to fuse it, passes into the mixed teroxide and tersulphide of A. known commercially as the *glass* of A. A native oxysulphide, of a pretty red colour, is called *red A. ore.* When the ordinary sulphide of A. is boiled with potash, or the carbonate of potash, it dissolves; and thereafter, on boiling, deposits a reddish-brown substance, known as *mineral kermes.* The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of A.

There is also a chloride of A. ($SbCl_3$) prepared by heating sulphide of A. and hydrochloric acid together, and which has the common name of butter of A. It is generally obtained as an oily liquid, of the consistence of melted butter, and of a golden yellow colour. Mixed with olive oil, it is used by gunmakers as *bronzing salt,* to impart a yellow colour to gun-barrels. The surface of the metal is afterwards polished by a burnisher, or coated with a varnish.

The various compounds of A. are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic,* a compound of teroxide of A., potash, and tartaric acid (SbO_3,KO,T).

ANTINO'MIANISM (Gr. *anti,* against, and *nomos,* law), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by the advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi., and 2 Pet. ii. 18, 19, it would seem that a tendency to A. had manifested itself even in the apostolic [illegible] many of the Gnostic sects were really antis. [illegible] were probably also some of the heretics [illegible] middle ages; but the term was first [illegible] time of the Reformation, when it was [illegible] Luther to the opinions advocated by [illegible] Agricola had adopted the principles of [illegible] mation; but in 1527 he found fault with [illegible] for recommending the use of the law, [illegible] larly of the ten commandments, in order to [illegible] conviction and repentance, which he declared [illegible] sistent with the gospel. Ten years after [illegible] tained in a disputation at Wittenberg, that [illegible] are justified simply by the gospel, the law [illegible] way necessary for justification or for [illegible]. The 'Antinomian Controversy' of [illegible] Luther took a very active part, to which [illegible] in a retractation by Agricola; [illegible] extreme than his were afterwards [illegible] some of the English sectaries of the [illegible] Commonwealth; and, without being formally professed by a distinct sect, A. has been from time to time reproduced with various modifications. [illegible] ought, however, to be borne in mind, that A. has no reference to the *conduct,* but only to *opinions* of men; so that men who practically regard and violate the known law of God are therefore antinomians; and it is certain that men really holding opinions [illegible] antinomian, have in many cases been [illegible] life. It is also to be observed that the term has been applied to opinions differing widely from each other. In its most extreme [illegible] the rejection of the moral law as [illegible] upon Christians; and a power or privilege [illegible] for the saints to do what they please, [illegible] judice to their sanctity; it being [illegible] them nothing is sinful; and [illegible] the perfection of Christian liberty. [illegible] extreme A., than which nothing can be [illegible] nant to Christianity, there is also sometimes [illegible] nated by this term the opinion of those who [illegible] to seek or to see in the Bible any rule [illegible] binding upon Christians, and regard [illegible] the guidance of gospel principles and [illegible] of Christian love; an opinion which, [illegible] be thought of its tendency, is certainly [illegible] deemed of the same character. [illegible] Probably, the A. that does not arise

:y, usually originates in mistaken notions
in liberty, or in confusion of views as to
en between the moral law and the Jewish
ceremonial ordinances.

'INOUS, a beautiful youth of Claudiopolis,
ia. He was page to the Emperor Hadrian,
object of his extravagant affection, accom-
him in all his travels, but was either
accidentally in the river Nile, or as some
committed suicide, from a loathing of the
ed, in 122 A. D. His memory and the grief
emperor were perpetuated by many statues
reliefs, of which several are very beautiful,
ally two now in Rome—one found in the
and the other in the villa of Hadrian. 'In
ures of A.,' says Winckelmann, 'the face
rather melancholy expression; the eyes are
with fine outlines; the profile is gently sloped
s; and the mouth and chin are especially

the wealthy Romans, and was famed through-
e whole world for the abundance of its con-
es and the splendour of its luxury. It received
-trabo the name of *Tetrapolis*, on account
ee new sites having been successively built
and each surrounded with a wall. Its public
s were magnificent. The principal were the
; the Senate-house; the Temple of Jupiter,
hed with gold; the Theatre, Amphitheatre,
esarium, besides an aqueduct, a public pro-
le, and innumerable baths. At the beginning
Roman empire, it was as large as Paris, and
any generations after, continued to receive
ous embellishments from the emperors. Nor
glory fade immediately after the founding of
antinople, for though it then ceased to be the
ity of the East, it rose into new dignity as
stian city. Ten councils were held in it.
Churches sprang up exhibiting a new style of architecture, which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbour, Seleucia. The Antiochenes themselves, however, brought about the ruin of their beautiful city. They were famous, above all other people in ancient times, for their biting and scurrilous wit, and for their ingenuity in devising nicknames; and when the Persians, under Chosroes, invaded Syria in 538 A. D., the Antiochenes could not refrain from jesting at them. The Persians took ample revenge by the total destruction of the city, which, however, was rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the 7th c. In the 9th c. it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it on the 3d of June 1098. At the close of the 13th c., the sultan of Egypt seized it: since then, it has undergone a variety of vicissitudes, and at present forms a portion of Syria, in the eyalet of Aleppo. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of the walls built by Justinian, and of the fortress erected by the Crusaders. The houses are generally of stone, and roofed with red tiles; the streets are narrow; the manufactures few and unimportant. The population is variously reckoned at from 6000 or 7000 to 16,000 or 18,000.

ANTIOCHUS, a common Greek name, was borne by thirteen kings of Syria, four kings of Commagene (a small country between the Euphrates and Mount Taurus), and many other persons of note (see Smith's *Dictionary of Greek and Roman Biography*). A. Soter, the first of the Syrian dynasty, or Seleucidæ, as they were called from their founder, was the son of Seleucus, the general and one of the successors of Alexander. A. was the fruit of one of those marriages which Alexander celebrated at Susa between his generals and the princesses of Persia. His mother's name was Apama. From this fact we gather that A. was probably born in 324 B.C. For the earlier career of A., see SELEUCUS. On the murder of his father in 280 B.C., A. succeeded him in his dominions, but he afterwards permitted Antigonus Gonatas to retain possession of Macedonia on his marrying Phila, a daughter of Seleucus. A. was much occupied in wars with the Gauls, who invaded Asia Minor, and, on one occasion, is said to have gained a victory over them by the help of his elephants, from which circumstance he derived the name of Soter (Saviour). He was subsequently killed in a battle with the Gauls (261 B.C.), and was succeeded by his son A. II. This A. is mentioned in the Book of Daniel (xi. 6) as the king of the north—the king of the south being Ptolemy, whose daughter, Berenice, A. had been compelled to marry. On the death of Ptolemy, A. recalled his former wife, Laodice; but she, in revenge for the insult which she had received, caused A. to be murdered, along with Berenice and her son. A. lost the provinces of Parthia and Bactria.

But the most distinguished of the Seleucidæ was A. III., surnamed the Great, who was the son of Seleucus Callinicus, and grandson of the preceding. In his earlier wars with Ptolemy, Philopator A. was generally successful; and though he was defeated in a great battle fought near Gaza, he afterwards, by his victory over the Egyptian general, Scopas, obtained entire possession of Palestine and Cœle-Syria. In this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, A. at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy,

and gave her Cœle-Syria and Palestine as a dowry. The formidable enemy which he thus hoped to escape encountered him at a later period of his career. Having conquered Philip of Macedonia, the Romans no longer dreaded a war with A., and accordingly sent him an embassy, demanding the surrender of the Thracian Chersonese, and of the places which he had conquered from Ptolemy, whose guardian the Romans had become. In 191 B. C., he was entirely defeated by the consul Acilius Glabrio at Thermopylæ, and compelled to return to Asia. Having a second time tried the fortune of war, he was defeated by Scipio, who had crossed over into Asia, and very severe terms were imposed on him. He found so much difficulty in raising money to pay the tribute the Romans demanded, that he was led to plunder a temple in Elymais, when the people rose against him, and killed him (187 B. C.). The fate of A. was foretold in the Book of Daniel (xi. 18, 19).

A. IV., (175—164 B. C.) surnamed Epiphanes, by his tyranny and sacrilege, excited the Jews to a successful insurrection under their leaders Mattathias, Judas Maccabæus, and the other members of that heroic family. The monstrous life of A. is recorded in the books of the Maccabees. The last of the Seleucidæ, A. XIII., surnamed Asiaticus, was deprived of his kingdom by Pompey, who reduced Syria to a Roman province (65 B. C.).

ANTIPÆDOBA'PTIST, a term exactly designating one who objects to child-baptism. As such a one, however, is generally known in this country under the name Baptist, see BAPTIST.

ANTI'PAROS (anciently called Olearos or Oliaros), one of the Cyclades islands, celebrated for a stalactitic cave, is separated from Paros by a narrow strait. It contains about 400 inhabitants, and forms a part of the eparchy of Naxos. A. is 7 miles in length by about 3 in breadth; it is scantily supplied with water, but the flats in the north and west are tolerably fertile. Corn and wine are cultivated, but not to any great extent. The principal occupation of the inhabitants is fishing. From Kastron, the only village in the island, the distance to the celebrated grotto is about an hour and a half's ride. This wonderful cave is not alluded to by any Greek or Roman writer whose works are extant, but must have been visited by the curiosity-hunters of antiquity, for, in 1806, Colonel Leake deciphered a Hellenic inscription which contained the names of those who had descended into it in ancient times. It is situated in the side of a mountain on the S. coast of the island, which is described as a mass of white marble. The top or entrance of the cave has a striking appearance; but the sloping descent is rather dangerous, on account of the cord by which the traveller holds being extremely slippery from constant humidity. The bottom once reached, and the grotto entered, there is presented to the eye as dazzling a specimen of stalactitic formation as can well be conceived—the roof, floor, and walls of the various chambers, all glittering with the most gorgeous incrustation, though it is said that the smoke of the torches and the constant fingering of visitors, are sullying the primitive purity of the massive columns. It is believed that there are other caves of equal splendour in the vicinity which have not yet been discovered. The height of the known cavern is 80 feet; its length and breadth more than 300; but it seems the eye can only take in at once a length of 150 feet, and a breadth of 100. The grotto was first made known to the modern world in 1673, by the then French ambassador to the Porte, M. de Nointel.

ANTI'PATER. Of the many persons who bore this name in antiquity, the most celebrated was one of the generals and confidential friends of King Philip of Macedon. When Alexander led his troops into Asia, he left A.—who, along with Parmenio, had endeavoured to dissuade him from the expedition—as governor of Macedonia. A. discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but Olympias, the mother of Alexander, who entertained a dislike to A., prevailed on her son to appoint Craterus as regent of Macedonia. Alexander, prompted also, it is supposed, by his own jealousy of A., consented, but died before the change was carried into effect; and A. was left to share with Craterus the government of Alexander's territories in Europe. The government of Macedonia was assigned to him; and soon after, he was called upon to defend himself against an alliance of the Grecian states. With the assistance of Craterus—on whom he afterwards bestowed his daughter Phila in marriage—and to a certain extent of Leonnatus, he succeeded in reducing the allies to subjection. Democracy at Athens was abolished, a garrison admitted into Munychia, and the leaders of the popular party put to death. When Demosthenes was summoned to the presence of A., he took poison, which for some time he had been carrying on his person, and died in the temple of Poseidon (322 B.C.). This war was followed by another with Perdiccas, who was also his son-in-law, in which A. was again successful. After the murder of Perdiccas in 321 B.C., A. was appointed to the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age, in B.C. 318 or 319, leaving the regency to Polysperchon, to the exclusion of his own son Cassander.

The others of this name were: I. A., second Cassander, king of Macedonia, who lived in the B.C.—II. A., the father of Herod the Great flourished in the days of Pompey and Ju[illegible] was a firm friend of the Romans, and about 47 B.C. was appointed procurator of Ju[illegible] was poisoned in 43 B.C. by one whose [illegible] twice saved.—III. A., grandson of the [illegible] son of Herod the Great by his first wife worthless prince, who was perpetually co against the life of his brothers, until his [illegible] condemnation at Jerusalem before Quintilius V the Roman governor of Syria. He was co in prison five days before Herod died, and [illegible] same year with the massacre of the inno Bethlehem.

A. was likewise the name of various eminent men in ancient times—physicians, philosophers, historians, poets, mathematicians, and grammarians.

ANTI'PATHY is the term applied to a [illegible] of cases in which individuals are dis[illegible] affected by, or violently dislike, things [illegible] or agreeable to the majority of mankind. [illegible] peculiarities are no doubt sometimes [illegible] early life by injudiciously terrifying c[illegible] some object, the mental impression bec[illegible] ent. A large class of persons have a[illegible] food, and from childhood refuse to taste it. others, again, the aversion is limited to one kin[illegible] meat, as veal or pork; others are averse to milk. Nor is this feeling a conscious caprice[illegible] an exertion of the will might remove; generally found that contact with the objec[illegible] A. is resented by the bodily economy, and of poisoning are rapidly produced. Some with these symptoms who have no mer[illegible] to the article. We read of a count[illegible] a liking for beef-udder, but directly it [illegible] lips they became swollen. There is a boy, who, 'if at any time he ate of

would swell, in his face would rise purple and black spots, and he would froth at the mouth.' Some medicines affect particular persons dangerously, even when given in very minute doses: a single grain of mercury has been known to induce a profuse salivation, with destruction of the jaw-bones. On others, medicines have a peculiar effect—astringents may purge. Every summer, in Great Britain, persons may be seen with the most distressing irritation of the nasal and palpebral mucous membranes, produced by the exhalations arising from the fields during the inflorescence of the hay-crop. In others, an asthmatic condition is induced by the same cause. The air of some places has a similar influence on individuals: a gentleman was always attacked with asthma if he slept in the town of Kilkenny, and another only escaped a fit of that complaint, if he slept anywhere else.

Still more remarkable antipathies are those affecting the special senses. Nearly all persons have a dislike at reptiles, but some few *faint* on *seeing* a toad or lizard, others on seeing insects. 'The Duke of Anjou swooned at sight of a leveret—a hare did not produce the same effect. Tycho Brahé fainted at the sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert at a pig.'—*Millingen.* The *hearing* a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen particles of food affect others—often, no doubt, from a too perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Hufeland records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety surface of a peach.—This subject will be further considered under IDIOSYNCRASIES.

ANTIPHLOGISTIC (Gr. *anti*, against, and *phlogo*, I burn), a term applied to remedies, and also to regimen, that are opposed to inflammation; such as blood-letting, purgatives, low diet, &c.

ANTIPHON, the earliest of the ten Attic orators in the Alexandrine canon, was the son of Sophilus the Sophist, and born at Rhamnus in Attica 480 B.C. In his youth, the reputation of Gorgias, the most showy and insincere of all the Greek rhetoricians, was at its height. A. soon became convinced of the worthlessness of that oratory which the fashion of the time so highly valued, and resolved to introduce a new and better kind. He laboured to make his arguments clear, solid, and convincing, so that it might be impossible for the judges who listened to the speeches he wrote to refuse their assent to his propositions. His success was unmistakable. Although he never made a public appearance as a pleader in the courts of justice, but contented himself with writing speeches for others to deliver, he acquired great influence, which he did not fail to exert for the furtherance of his political principles. To him must be attributed the overthrow of the Athenian democracy (411 B.C.), and the establishment of the oligarchical government of the Four Hundred; for although Pisander figured prominently before the people in this revolution, the whole affair, according to Thucydides—one of A.'s pupils in oratory, and a man admirably fitted to judge of such a point—was secretly planned by him. The oligarchical government did not prosper. Dissensions quickly broke out among the Four Hundred, and six months after, Alcibiades, the brilliant demagogue, was recalled. A. was brought to trial for treason, in having attempted to negotiate peace with Sparta. He is said to have made a noble defence of himself. Thucydides affirms that an abler was never made by any man in a similar position. It was his first and last oration. He was condemned to death; his property was confiscated, his house razed to the ground, his remains forbidden interment in Attica, and his children for ever declared incapable of enjoying civic privileges. Of the 60 orations of A. which the ancients possessed, only 15 have come down to us. Three of these are written for others, and are greatly admired for their clearness, purity, and vigour of expression; the remaining 12 appear to have been intended as specimens of school-rhetoric for his pupils. They are not held in equal estimation with the others.

ANTI'PHONY, a name given by the ancient Greeks to a species of musical accompaniment in the octave, by instruments or voices, in opposition to that executed in unison, which they called *Homophony*. A. is also the name of a species of sacred song, sung by two parties, each responding to the other; a practice which was cultivated in the early ages of the Hebrews, Greeks, and Romans. Many of the Psalms of David shew that antiphonal singing was then in use. Its introduction into the Greek Church is ascribed to Ignatius, Bishop of Antioch, in the 2d c.; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western Church, in the 4th c. The dividing of the antiphonies into verses, with rules regarding the same, is attributed to Pope Celestin in 432. Pope Gregory I., in 590, prepared the first regular *Antiphonarium* (see *Durandi Rationale Divinorum Officiorum*, Mainz, 1459). It was early a custom, which became especially common after the 13th c., to date deeds with the beginning words of the A. (*Introitus*), which in these times served for the day of the month and of the week. The Reformed Christian Churches of Germany and England have still retained a certain degree of antiphonal singing. The chanting of the Psalms in the English cathedral service is an imitation of the ancient antiphony.

ANTI'PODES, a word of Greek origin, signifying, literally, those who have their feet over against each other. As applied to geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation, there necessarily arise many secondary relations. A. must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in long. exactly 180°, with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equidistant from the equator in opposite directions. Take Edinburgh, as an example, in lat. 55° 57′ N., and long. 3° 11′ W.; its A. must be in lat. 55° 57′ S., and in long. 183° 11′ W., or rather in 176° 49′ E.—which is merely an undistinguishable spot in the Antarctic or Southern Ocean. Take, as another example, London, in lat. 51° 30′ N., and long. 0° 5′ W. Its A. must be in lat. 51° 30′ S., and in long. 180° 5′ W., or rather 179° 55′ E.—coinciding pretty nearly with a small island to the south-east of New Zealand. This small island, in honour rather of London than of itself, has appropriated the term A. as its own peculiar name.

Between A. in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. With respect, however, to the former contrast, some explanation may be required. This,

for instance, being Wednesday in London, was last midnight in that city the noon of Tuesday or of Wednesday at A. Island? The answer is, that, according to circumstances, it may be held to be either the one or the other. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4′ of time to 1° of long., or of 12 hours of time to 180° of long.; so that, on reaching A. Island from London by the Cape of Good Hope, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Wednesday. In going westward, again—that is, in leading, as it were, the sun—one, from day to day, postpones every noon and every midnight in the same proportion as above; so that, on reaching A. Island from London by Cape Horn, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Tuesday. In fact, navigators in opposite directions, meeting at any intermediate point whatever of the earth's circumference, always differ in their computation of time by a whole day, or 24 hours. In two cases, this has been permanently exemplified: the Spaniards at the Philippines, who have come from the east, are a day behind the Portuguese in Macao, who have come from the west; while, on the north-west coast of America, the Russians from the west were a day in advance of the British from the east.

ANTIPOPE was a pontiff elected in opposition to one canonically chosen. The first antipope is reputed to be Laurentius, elected 398, in opposition to Symmachus. Several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the Great displaced successively two bishops of Rome; and when Sylvester III. had expelled the simoniacal and profligate pope Benedict IX., Conrad II., king of Germany, brought back this worthless pastor, who hastened to sell his dignity to Gregory VI. There were now, consequently, three popes, and their number was increased to four by the election of Clement II. in 1046. Shortly after, Alexander II. found a rival in Honorius II.; and in 1080 the same unseemly spectacle was witnessed, when Henry IV., emperor of Germany, elevated to the papal chair Guibert of Ravenna, under the title of Clement III., in opposition to his implacable adversary, Gregory VII. But after the death of Gregory, Clement was himself opposed successively by Victor III. and Urban II., and at last died at a distance from Rome, having just beheld the exaltation of Pascal II. as the successor of Urban. During the 12th c., several antipopes flourished, such as Gregory VIII. and Honorius III. On the death of the latter, France began to intermeddle in these disgraceful strifes, and upheld the cause of Innocent II. against Anacletus; while the kings of Sicily, on the other hand, more than once set up a pontiff of their own against the choice of the emperors. Between 1159 and 1378, there were four antipopes; but the most remarkable epoch is 'the great schism of the West,' produced by these disedifying rivalries in 1378—a schism which divided the Church for fifty years. It broke out after the death of Gregory XI., at the election of Urban VI., whom the voice of the Roman people, demanding an Italian pope, and not one who should fix his pontificate, like several of his predecessors, at a distance from Rome, had elevated to the papal throne. The French cardinals objected, withdrew to Provence, and elected a new pope, under the name of Clement VII., who was recognised by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe, supported Urban VI. These two popes excommunicated each other; nor did they even fear to compromise their sacred character by the most cruel outrages and the most odious insults. The schism continued after their death, when three popes were elected by different parties, all of whom were deposed by the Council of Constance in 1415, and Cardinal Colonna elected in their room, under the title of Martin V. The last antipope was Clement VIII. With him the schism ceased. These divisions are often alleged as an argument against the doctrine of papal infallibility; but Catholics consistently affirm that the privilege of infallibility is only claimed in matters of doctrine, and has no relation to questions of fact, such as disputed succession, or canonicity of election. See Pope.

ANTIQUARIES, SOCIETY OF. Under this name, associations of learned men, established for the exclusive purpose of cultivating the study of antiquities, exist in the principal countries of Europe and in America—at London, Edinburgh, Paris, Rome, Vienna, Copenhagen, &c. The London Society of A. received its charter in 1751, but had commenced its meetings as early as 1707; minutes began to be kept in 1718. Long previous to this, in 1572, an Antiquarian Society was established by Archbishop Parker and Sir Robert Cotton. It was dissolved about 1604 by King James, who regarded the inquiries of the A. with suspicion. The present 'Society of A. of London' consists of a president, a council of 21, and several hundred Fellows. It has published a number of valuable works, among the most inte which is a series of Anglo-Saxon and literary remains. The Scottish Society founded in 1780. It has published four Transactions, nine of Proceedings, and sev laries, besides having collected a valuable which has now become national propert arranged for permanent exhibition at the of the government. The *Société des A de France* took that name in 1814, founded in 1805 as the *Académie C* the change of name, the sphere of labours was greatly enlarged. It many important works. A similar i *Société des Antiquaires de Norm* Caen in 1824. The Copenhagen body of high reputation. See ARCHÆOL

ANTIQUE. As the term ancients is co applied to the Greeks and Romans, the wo used with reference to their works of art cially their incomparable sculptures. The A in works of art is distinguished by critics fr Romantic or Medieval, and also from the The sculpture of the Greeks is characte freshness, originality, and ideality; and it underwent have their parallels in the of the literature and general culture In the earliest times, the statues ha character, and looked more like barous nations than deities in hu a came stern, Titan-like forms, corr Prometheus of Æschylus; next, Phidias, Polycletes, and Polygnotus—lik acters in the dramas of Sophocles—pres humanity in its purest and noblest ide Then, as Euripides in poetry left the old destiny, and derived motives and action nary human passions, so statuary dese the ideal to a closer resemblance to actual life; as we see in the works of Lysippus. Afterwards, when Aristo duced comedy, forms of everyday appear in sculpture; and thus a gra was made from the art of the Gre ideal, in the true sense of the wo Romans, which was real, monumen

like. The Romans were the realists of the ancient world; their indigenous philosophy was of a popular kind; their poetry, so far as it was national, was entire; and their works of art may be regarded as monuments and portraitures of real life, quite suitable for a nation of soldiers, lawyers, and politicians, but vastly inferior to the ideal beauty displayed in the best period of Grecian art.

ANTIQUITIES. See ARCHÆOLOGY.

ANTIRRHINUM. See SNAPDRAGON.

ANTISCORBUTICS. See SCURVY.

ANTISEPTICS are substances which arrest putrefactive changes that dead vegetable and animal matter is liable to undergo when exposed to warmth, and moisture. A. are therefore antiseptics; and the term itself indicates the office of the members of the class fulfil (*anti*, against, *sēptikos*, putrefactive). The theory of the action of A. is, that one or two of the three indispensable conditions of putrefaction—viz., 1, a moderate warmth, 2, access to air, and 3, moisture—are arrested or neutralised. Thus, in the preservation of fish in transit or during transport by railway, they are packed in barrels with ice, which keeps down the temperature; and though air and moisture gain access, yet the putrefactive processes cannot go on. The same preservative power of cold is employed naturally in the discovery of remains of mammoth and other animals imbedded in the ice of the polar regions, and which doubtless have been preserved up there for ages. In a less degree, the influence of cold as an antiseptic is observed in the longer preservation of meat, eggs, and other animal matters kept in winter than in summer.

Again, warmth and moisture may be present, but if the air be excluded, putrefaction does not go on. The ordinary mode of preparing *preserved meats* affords the best illustration of this point. The substance to be preserved is placed in a tin dish covered with a lid, and leaving a very small opening. When the dish and its contents is heated, the air which fills the pores of the solids, and is dissolved in the juices, is driven off, and escaping by the aperture in the cover of the dish, leaves the contents devoid of air. If the opening be now closed with solder, the air is prevented from returning; and whatever climate the preserved meat be sent to, yet so long as the tin casing remains good, and refuses to admit the air, so long will the contents continue wholesome and eatable. The common plan of preserving eggs by rubbing over the shell with tallow or oil, is based on the principle of filling up the pores of the shell, so as to deny the admission of the air. Moisture is likewise necessary for the process of putrefaction. Thus, if the contents of an egg be turned out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistency, and may be kept in this state for years without exhibiting the slightest symptom of passing into a putrid or rotten condition. In the same way meat may be kept quite fresh by depriving it of moisture. Eggs dried up in this manner require to be soaked in cold water, and then boiled, will present themselves in a condition differing in flavour and taste from an ordinary egg.

The important chemical A. are—Alcohol, spirit, creasote, pitch-oil, coke-oil, sugar, tannic acid, sulphurous acid, common salt, nitre, alum, chloride of zinc, sulphate of copper (blue vitriol), chloride of copper, corrosive sublimate, arsenic.

The manner in which these A. act is very different.—1. Sulphurous acid acts by combining with the oxygen, and thereby deoxidising the substance. 2. Sirup of sugar acts by combining with the water of the substance to be preserved. 3. Creasote, tannic acid, alum, chloride of zinc, sulphate of copper, corrosive sublimate, and arsenic, are useful in forming compounds with the organic matter, which are not so liable to become putrescent as the uncombined organic substance. 4. Alcohol, wood-spirit, common salt and nitre, act in a double way, by combining with the water of the putrescible substance, and by combining with the substance itself, so as to form a more durable compound.

Some of the more important uses to which the chemical A. are applied are—1. In the preservation of anatomical specimens, where alcohol, and less often, chloride of zinc, are the agents; 2. In the curing of herring and other fish, where common salt is generally used; 3. In preparing corned or salted meat and tongues, where common salt and nitre are jointly employed; and 4. In the manufacture of size for writing-papers, where the paper-maker uses sulphite of soda or antichlore (containing sulphurous acid) to arrest the decomposition of the scraps of hides used in the manufacture of size. In the preservation of timber, A. are also taken advantage of. The wood is placed in a steam-box, and the air contained in its pores being replaced by steam, the whole casing is closed tight, and allowed to cool, when the steam condenses, and leaves a vacuum in and around the block of wood. On the introduction thereafter of one of the A., it finds its way into the innermost pores of the timber. Wood thus prepared is not nearly so liable to decay as it ordinarily is; and the A. seem to act here not only directly in withdrawing water, and forming durable compounds, but in offering a poisonous dose to minute plants and animals which tend to house themselves in the wood. The use of sulphate of copper for this purpose was suggested by Bonchardat; of corrosive sublimate, by Kyan (hence the process was called *Kyanising*); and of chloride of zinc, by Sir W. Burnett (hence the term *Burnettising*).

ANTISTHENES, founder of the Cynic school of philosophy, was the son of A., an Athenian. The date of his birth is not known, but he fought in his youth at Tanagra (426 B.C.), and he survived the battle of Leuctra (371 B.C.), and died at Athens at the age of 70. After listening to the teaching of Socrates, he gave up the profession of rhetoric, which he had followed at first as a disciple of Gorgias, in order to apply himself wholly to the study of moral philosophy. He was present at the death of Socrates, and never forgave his persecutors. A. held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honours, and even learning. Opinions of still greater extravagance are ascribed to A., but it is probable that they were rather extreme views, which he put into the mouths of the interlocutors in his dialogues, than expressions of those which he himself entertained. Even in his condemnation of pleasure, he excepted such as springs from the soul, or is founded on true friendship. In consistency with his teaching, A. appeared as a beggar, clad in ragged garments—an eccentricity which Socrates is said to have reproved by saying, 'I see your pride through the holes in your cloak.' The singularity affected by A. gained many imitators, and among them Diogenes, who chose to live in a tub, and surpassed the master himself in Cynic practice. After the death of Socrates, A. taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which, it is said, his school derived its title. His writings—among them a polemical work against Plato—have mostly perished. Such fragments as remain have been collected by

Winckelmann (*A., Fragmenta*, Turici, 1842). Ritter classes A. with the 'imperfect Socraticists.'

ANTI'THESIS (*tithēmi*, to place, *anti*, against), a figure of speech in which words are placed in direct opposition to each other, to produce a strong contrast. Thus Lessing, in criticism on a book, says: 'It contains many good things, and many new; but the good are not new, and the new are not good.' A., when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated.

ANTITRINITA'RIAN, one who denies the doctrine of the Trinity. An A. differs from a Unitarian only in this respect, that his objection to the doctrine in question is made on philosophical, while that of the latter is made on theological grounds. A Unitarian is one who accepts the Bible as inspired, but does not find in it the doctrine of the Trinity; an A. is, or may be, a philosophical theist, who denies the inspiration of Scripture. Mohammed, from the stand-point of a new and hostile religion, also denied this great Christian dogma. He announced himself, with fierce emphasis, an A.; and his followers to the present day are characterised by the intensity of their monotheism. See UNITARIAN and SOCINIAN.

A'NTITYPE, a Greek word, literally signifying a type or figure which corresponds to some other type or figure. In its theological sense, it denotes, not a type, but the person in whom any prophetic type is fulfilled; thus, Christ is called the A. of the paschal lamb. See TYPE.

A'NTIUM, one of the most ancient cities of Latium, stood on the coast 34 miles S.S.E. from Rome. Being favourably situated for commerce and piracy, it became, under the Volscians, into whose hands it had fallen, one of the most powerful enemies of rising Rome, until finally subdued (338 B.C.). It became a favourite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the Emperors Caligula and Nero; and the latter constructed a splendid port by means of two moles enclosing a basin two miles in circumference. Remains of the moles still exist, although the basin is mostly filled up with sand.

Antium was completely destroyed by the Saracens during the middle ages; and it was only in the 17th c., when the port was very partially restored, that the modern village of PORTO D'ANZO arose, the population of which does not exceed 500. Near the village Nettuno, in the neighbourhood, the ruins of a temple of Neptune are discernible under the sea.

ANT-LION, the larva of an insect (*Myrmeleon formicarium*) of the order Neuroptera, remarkable for its habits, which have been carefully observed by some of the ablest naturalists of Europe. It inhabits sandy districts, is not known in Britain, and is more common in the south of Europe than in the north. The perfect insect is about an inch long, and has a considerable general resemblance to a dragon-fly. The larva is rather more than half an inch long; it has a very large abdomen, and a small head, which, however, is furnished with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally moves backwards. It feeds upon the juices of insects, particularly of ants, in order to obtain which it excavates with the greatest ingenuity a funnel-shaped hole in sandy ground, and lies in wait at the bottom, all but its mandibles buried in the sand. Insects which approach too near to the edge of the hole, then become its prey, by the loose sand giving way, so that they fall down the steep slope. If they fall quite to the bottom, but begin to climb again, the A. throws sand upon them by

Ant-lion:
a, larva; *b*, perfect insect.

head, and so brings them back. It uses its head in the same way to eject their bodies from the pit, after their juices have been sucked, and throws them to a considerable distance; and by the same means throws away the sand in excavating its pit, first ploughing it up with its body, and then shovelling upon its head by means of one of its fore-legs. It always begins by working round the circumference of its future hole, and gradually deepens it; turning quite round as it works round the hole, so as to use the fore-leg of the other side. When it meets a stone which it cannot remove, it deserts the position, and begins another. The pit, when complete, is usually about thirty inches in diameter by half as much in depth.

ANTOMMARCHI, FRANCESCO, a well-known physician and native of Corsica, was born in the latter half of the 18th c. He owes his celebrity entirely to his intimacy with Napoleon. It was during the exile of the latter in St Helena that he was induced to leave Florence, where he held the office of anatomical dissector in the hospital of Santa Maria Nuova of Florence, and went out as private physician to the banished emperor. There was at first little cordiality between the two men, subsequently Bonaparte conceived a high opinion of his countryman, and at his death left him 100,000 francs. In 1821, A. returned to Europe, and published at Paris *Les Derniers Moments de Napoléon*, a work which has been very widely read. He now became involved in a dispute with the heirs of Mascagni—his old anatomical master—regarding certain anatomical plates which he announced as on the eve of publication. He affirmed that A.'s lithographed drawings were copies from the plates of Mascagni, and the controversy went on briskly for some time. The public grew tired of it, when it gradually died away and was forgotten. On the breaking out of the Polish revolution, A. departed for Warsaw, and received the appointment of general of the military hospitals. He soon returned to Florence, where he published a cast of Napoleon's head, which he affirmed to have taken when the emperor was on his death-bed. This declaration at once involved him in a hot dispute with the phrenologists, who were not satisfied with the conformation of the head, and therefore cast suspicions—some of them apparently not altogether ill founded—on the truth of A.'s statements. Harassed by the attacks of his adversaries, and sick of further controversy, he left Europe about 1836, resolved to emigrate to America. He died at San Antonio, in Cuba, on the 3d of August 1838.

[T]ON ULRICH, second son of Duke Ferdi- Albert of Braunschweig-Wolfenbüttel (till Braunschweig-Bevern, the title by which the was first known in Russia), was born in 1714. n the Russian Empress Anna was looking out for alliance for her niece, Anna Carlowna, Princess ckleuburg-Schwerin, the influence of Austria led to choose A. U. Accordingly, he came to Russia 1733, was appointed colonel of a cuirassier regi- and placed in the receipt of a considerable n. The marriage was, however, long delayed. rincess shewed a decided distaste for the icant character of the bridegroom-elect, and arried him to avoid a still more hated union the son of Biron. The birth of the Prince took place in 1740, a year after the marriage. at the same time, the empress falling dangerously appointed the infant prince her successor, and a regent. After her death, A. U. made some le attempts to reverse this appointment, which led to the punishment of those supposed to instigated them, and to his own military diation. Biron's conduct towards the parents infant prince becoming unbearably insolent, appealed in despair to General Münnich, ut a sudden end to Biron's sway, and d the grand-duchess and her husband regents. a few months, Anna ungratefully overthrew After his fall, as little unity prevailed the ministers at the helm as between her- and her husband, and the government was d upon as both a foreign and a contemptible one. ame the revolution of the 5th December 1741, in one night raised Elizabeth (q. v.) to the ne. A. U. and his consort were exiled, and lived at Cholmogory, in the government of Archangel. children were born to them in exile. Anna d in 1746. Catharine II. offered A. U. his free- but he declined it. Ultimately, he grew blind. exact year of his death is uncertain, but it is osed to have taken place about 1780. Catharine d to his children an asylum in Jutland, where all died in comfortable circumstances.

ANTONELLI, GIACOMO, a distinguished cardinal, was born on the 2d of April 1806, at Sonnino, a village situated near the Pontine Marshes. His father, a woodcutter, sent A. to be educated at the Grand Seminary of Rome, where he proved himself one of the cleverest students of his time. He gained the favour of the late Pope Gregory XVI., who named him a *prelato*, and gave him some excellent ecclesiastical appointments. In 1841, A. became Under-secretary of State to the Ministry of the Interior; in 1844, Second Treasurer; and in the following year, Finance Minister of the two Apostolic Chambers. Pope Pius IX. having mounted the papal throne in 1846, raised A., during the next year, to the dignity of Cardinal-deacon of St Agatha alla Suburra. In 1848, A. was President and Minister of Foreign Affairs in a liberal cabinet, which framed the famous *Statuto* or Constitution, proclaimed in 1848, the principal articles of which were so very soon eluded. In the Œcumenical Council, which began its sittings in 1869, A. shewed great tact and ability in restraining the zeal and impetuosity of his impulsive master.

ANTONELLO (of Messina), a painter who holds a prominent position in the history of Italian art, was born probably about 1414, in Sicily. In his day, the paintings of Johann van Eyck (of Flanders) enjoyed a wide celebrity, and several specimens were brought to Naples, where A. saw one of them. Admiring the new style of oil-painting, he travelled into Flanders, and learned the secrets of the art from Van Eyck. Afterwards, he settled in Venice, and was the first Italian who painted in oil-colours, in which he gave instruction to many artists. He died probably in 1493. His works are now rather scarce. One, in the Museum at Berlin, bears the date 1445.

ANTONINUS, MARCUS AURELIUS, the son of Annius Verus and Domitia Calvilla, was born at Rome on the 20th of April 121 A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who used to term him, not *Verus*, but *Verissimus*, and who conferred high honours on him, even while a child. When only seventeen years of age, he was adopted, along with Lucius C. Commodus, by Antoninus Pius, the successor of Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D. he was made consul; and from this period to the death of Pius, in 161 A.D., he continued to discharge the duties of his various offices with the greatest promptitude and fidelity. The relation which subsisted between him and the emperor was of the warmest and most familiar kind. On his accession to the throne, he strikingly illustrated the magnanimity of his character, by voluntarily sharing the government (which Pius had left in his last moments, and the senate offered to him *alone*) with young Commodus, who henceforth bore the name of Lucius Aurelius Verus, and to whom he gave his daughter Lucilla in marriage. Towards the close of 161 A.D., the Parthian War broke out, and Lucius, a young man of vigorous bodily habits, was sent to the frontiers of the empire, to repel the incursions of the barbarians; but intoxicated with the enervating pleasures of the East, he obstinately refused to go beyond Antioch, and intrusted the command of the army to his lieutenant Cassius, who gained several brilliant victories. Lucius returned to Rome (166 A.D.), and enjoyed a triumph to which he had no real claim; for all the great achievements of the war were accomplished by his officers, while he was revelling in the most extravagant licentiousness. In the meantime, Marcus Aurelius had distinguished himself by the prudence and energy with which he administered affairs at home. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself raged a pestilence, believed to have been brought home by the troops of Lucius; frightful inundations and earthquakes had laid large portions of the city in ruins, destroyed the granaries in which were kept the supplies of corn, and thus created almost universal distress, which stimulated to an incalculable degree the terror which the citizens entertained of their savage enemies. To allay the popular perturbation, Marcus resolved to go forth to the war himself. Hecatombs were offered to the offended gods, and the Roman legions set out for the north. Marcus and Lucius were, for the time, completely successful. The pride of the Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, was humbled, and they were compelled to sue for peace in 168 A.D.; in the year after which Lucius died. The contest was renewed in 170 A.D., and may be said to have continued with little intermission during the whole life of the emperor. Although fond of peace, both from natural disposition and philosophic culture, he displayed the sternest vigour in suppressing the revolts of the barbarians; but in order to accomplish this, he had to enrol amongst his soldiery vast numbers of gladiators and slaves, for his army had been thinned by the

ravages of the plague. His head-quarters were Pannonia, out of which he drove the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The same fate befell the Jazyges; but the most famous as well as the most extraordinary of all his victories, was the miraculous one gained over the Quadi (174 A. D.), and which gave rise to copious discussion amongst Christian historians and others. Dion Cassius's account is, that the Romans were perishing of thirst in the heat of summer, when suddenly the cloudless sky darkened, and abundant showers fell, of which the soldiers were taking advantage when the barbarians attacked, and would have cut them to pieces, if a storm of hail and fire had not descended on the former. That some extraordinary phenomenon occurred is evident, for there is a letter of Aurelius still extant in which he commemorates the event; and the emperor was a man incapable of uttering a falsehood, not to mention that there was an entire army living to disprove the statement, if untrue. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency; but the practical advantages that might have resulted from it were nullified by a new outbreak in the East, occasioned through the infamous treachery of his own wife, which demanded his presence; and though suffering from failing health, he was obliged to leave Pannonia. Before his departure, however, he learned that the ambitious governor, Avidius Cassius, who had rebelled against him, and seized the whole of Asia Minor, had perished by assassination. The conduct of Marcus Aurelius on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the Fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. Like Cæsar in similar circumstances, but in a more purely humane spirit, he received the head of his murdered adversary with quite opposite feelings to what had been anticipated, rejecting the bloody gift with all the loathing of a benevolent nature, and even shrinking from the presence of the murderers. On his arrival in the East, he exhibited the same illustrious magnanimity. He burned the papers of Cassius, without reading them, so that he might not be at liberty to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; disarmed the enmity, and dispelled the fears of the nobles who had openly favoured his insurgent lieutenant. While pursuing his work of restoring tranquillity, Faustina died in an obscure village at the foot of Mount Taurus; and her husband (and this was perhaps the single frailty of his character), though undoubtedly conscious of her glaring profligacy and infidelity, paid the most lavish honours to her memory.

On his way home, he visited Lower Egypt and Greece, displaying everywhere the noblest solicitude for the welfare of his vast empire, and drawing forth from his subjects, who were astonished at his goodness, sentiments of the profoundest admiration and regard. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew did the city of Jerusalem, he shewed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever laboured more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176 A. D., he reached Italy, and celebrated his merciful and bloodless triumph on the 23d of December. In the succeeding autumn, he departed for Germany, where fresh disturbances had broken out among the [illegible] less and volatile barbarians. He was again successful in several sanguinary engagements; but his originally weak constitution, shattered by [illegible] anxiety and fatigue, at length sunk, and [illegible] either at Vienna, or at Sirmium, on the [illegible] 180 A. D., after a reign of twenty years.

Marcus Aurelius A. was the flower of philosophy. It seems al[illegible]st i[illegible]xalica[illegible] harsh and crabbed a[illegible]l[illegible] duced as pure and [illegible] as the records of [illegible] Christian history, [illegible] philosophic theolo[illegible] [illegible] stoicism was the most [illegible] practical philosophic theories, and the one which earnestly opposed itself to the rapidly in[illegible] licentiousness of the time, that the chaste l[illegible] the youth was drawn towards it. At twelv[illegible] of age, he avowed himself a follower Epictetus, &c. Stoics were his teachers— Apollonius, and Junius Rusticus: [illegible] he to be considered one of the most [illegible] of the school. Oratory he st[illegible] Atticus and Cornelius Fronto. [illegible] was insatiable. Even after he had attain[illegible] highest dignity of the state, he did not di attend the school of Sextus of Chæronea. of letters were his most intimate frie received the highest honours both wh[illegible] and dead. His range of studies was embracing morals, metaphysics, math prudence, music, poetry, and pai[illegible] we forget that these were cultivat[illegible] the spring-time of his life, when strong, and experience had not sadd[illegible] and when study was his only labou[illegible], but [illegible] tumults of perpetual war, and the distracti[illegible] sarily arising from the government of an empire. The man who loved peace with his soul, died without beholding it, and yet the [illegible] ing presence of war never tempted him to a mere warrior. He maintained uncon[illegible] end of his noble life his philosophic thropic aspirations. After his decea[illegible] felt to be a national calamity, every [illegible] and many others in distant portions procured an image or statue of him, [illegible] a hundred years after was still fou[illegible] household gods. He became almost [illegible] worship, and was believed to appear in dre the saints of subsequent Christian ages.

There is one feature in his character, h which it would be dishonest to pass o hostility, namely, to Christianity. He was [illegible] cutor of the new religion, and, it is clea strated, was cognizant, to a certain ext of the atrocities perpetrated upon Numerous explanations have been [illegible] conduct in this matter. The most p[illegible] that he for once allowed himself to [illegible] by evil counsellors; but a deeper reas[illegible] found in that very earnestness with which [illegible] to the old heathen faith of his ancest believed it to be true, and to be the p[illegible] those philosophies which had sprung up [illegible] same soil: he saw that a new religion, the of which had been assiduously, th[illegible] unconsciously, misrepresented to h[illegible] immoral superstition, and a myst[illegible] conspiracy, was secretly spreading empire, and that it would hold no [illegible] the older religion, but condemned the strongest terms. It was, [illegible] tively easy, even for so humane [illegible] it his duty to extirpate this [illegible]

John Stuart Mill finds in this tragical
great emperor a most striking warning
danger of interfering with the liberty

or more single-minded in his devotion to it
—let him abstain from that assumption of
ability of himself and the multitude,
A. made with so unfortunate a result.'

TONINUS PIUS, Titus Aure'lius Fulvus,
emperor (138—161 A.D.), was born in the
reign of Domitian (86 A.D.). The family of A. was originally from Nemausus, now Nîmes, in Gaul. A. inherited great wealth, and early gave proof of excellent qualities. In 120 he was made consul; afterwards was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. By his wife Faustina he had four children, of whom three died, leaving a daughter, Faustina, afterwards wife of Marcus Aurelius. In 138 he was adopted by the Emperor Hadrian, in consequence of merit alone, and came to the throne in the same year. The reign of A. was proverbially peaceful and happy. In his private character, he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued during his reign, was partly stayed by his mild measures. He was little engaged in war, excepting in Britain, where he extended the power of Rome, and built a wall between the Forth and the Clyde, as a defence against invasions by the predatory inhabitants of the north; but he was frequently employed in arbitration and general counsel on the affairs of foreign states. 'Happy the nation which has no history.' The reign of A. illustrates this saying, for by the justice, wisdom, kindliness, and courtesy of the emperor, his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the recording of which formed the largest part of the historian's work in the dark centuries of the Roman empire. It is said that only *one* senator was impeached during A.'s lifetime.

Copper Coin of Antoninus Pius,
commemorative of his Victories in Britain, from one in the British Museum.

Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads, bridges, &c.; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet Pius was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonouring measures brought forward by the senate. A. died in 161 A.D. The column raised to his memory by his adopted son and successor, Marcus Aurelius Antoninus (q. v.), was discovered in 1709, and now exists only in fragments. The so-called Pillar of Antoninus, now in the *Piazza Colonna* at Rome, is that raised by the senate in honour of Marcus Aurelius, after his victory over the Marcomanni.

ANTONINUS, Itinerary of (*Antonini Itinerarium*), a valuable geographical work, containing the names of all the places and stations on the principal and cross roads of the Roman empire, with their distances from each other in Roman miles. It has been usually attributed to the Emperor M. Aurelius Antoninus, whence its name. The testimony, however, of the Greek geographer Æ
cus, author of the *Cosmographia*, assures us

a general survey of the Roman empire was commenced 44 B.C., in the consulship of Julius Cæsar and M. Antonius, and completed in the reign of Augustus, when the results of the survey received the sanction of the state. These results, it is with some probability inferred, are embodied in this *Itinerary*, which, it is further supposed, received additions and amendments in the time of the Antonines. Subsequent improvements were made down to the reign of Diocletian. The best editions are those of Wesseling (Amst. 4to, 1735), and Parthey (Berl., 1848).

ANTONI'NUS, WALL OF (*Antonini Vallum*), a barrier erected between the Firths of Forth and Clyde by the Romans, in the reign of Antoninus Pius, to restrain the encroachments of the native tribes. A fragment of a Roman pillar, which was at one time in the university of Edinburgh, fixes the date of its execution to 140 A.D. The superintendence of the work is generally attributed to the imperial legate Lollius Urbicus. Its length was about 27 English miles—the eastern termination being, according to two different suppositions, at Carriden, or at Kinniel, on the Forth; the western, at Old Kirkpatrick, or at Dunglass Castle, on the Clyde. The work consisted of a ditch about 20 feet deep and 40 wide, a rampart of earth and stone about 20 feet high and 24 feet thick at the base, and on the inner or south side of the rampart a paved military road. It was protected by a chain of nineteen forts, with watch-towers between. The line of the wall may still be traced to a considerable extent. The most perfect fragments are at Elf Hill, on the moor of Bonnieside, about a mile and a half from Castlecary; within the park of Callander House, near Falkirk; and on the slopes at Inveravon, not far from the railway station at Polmont. It is commonly designated *Graham's Dike*—a name given also to more than one ancient ditch and rampart in England. The best accounts of the Wall of Antonine are in Roy's *Military Antiquities of the Romans in North Britain* (Lond., 1793), and in Stuart's *Caledonia Romana* (2d. ed., Edin., 1852).

ANTO'NIUS, MARCUS (MARK ANTONY), the Roman triumvir, born in 83 B.C., a descendant of one of the oldest patrician families, was the son of the Prætor M. Antonius Creticus, and, on the side of his mother Julia, was related to Julius Cæsar. His youth was wasted in dissipation, and finding himself pressed by numerous impatient creditors, he escaped to Greece in 58 B.C., where, for a short time, he listened to the teaching of Athenian philosophers and orators. His studies here were soon interrupted by the Proconsul Gabinius, who appointed him as leader of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, A. distinguished himself by his courage and activity, and ingratiated himself with the soldiers. After assisting Cæsar in Gaul, he went to Rome in 50 B.C., to advance the interests of the former, who stood in great danger from the hostility of the oligarchical party, and was appointed an augur, and chosen one of the tribunes of the people. In the following year, on account of his adherence to the party of Cæsar, he was expelled from the curia, and fled to Cæsar, who made use of this event as a pretext for his war against Pompey. At the outbreak of this war, A. received the appointment of commander-in-chief in Italy. In the battle of Pharsalia, he commanded the left wing of Cæsar's army. In 47, he was made Master of the Horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself; got perpetually drunk; divorced his wife, and married an actress, with whom he paraded

finding troops still faithful to him in Libya was appointed. He returned to Egypt, where, with Cleopatra, he once more forgot political cares and pleasures, until his amusements were suddenly interrupted by the arrival of Octavianus at Alexandria. A. now roused himself, made a charge with his cavalry, and repelled the enemy; but the success was only momentary. Deserted by the fleet, as by his own army, and suspecting that Cleopatra had conspired against him, he retired to her palace, from which the queen had previously fled. Deceived by a false message informing him of the death of Cleopatra, A. committed suicide by falling upon his sword, in the year 30 B.C.

ANTONIUS or ANTONY OF PADUA, SAINT, born at Lisbon, August 15, 1195, and, on the mother's side, was related to Godfrey of Bouillon. He was first a monk of the Augustine order, and in 1221 became one of the most active propagators of the order of Franciscans. On his missionary voyage to Africa, being cast on the coast of Italy, he preached with great success at Montpelier, Toulouse, Bologna, and Padua, where he died, June 13, 1231. The legends of A. are full of absurd fables. Among others, we are told that his eloquence as a preacher was so great that even the fish in the sea were deeply affected by it! His anniversary falls on June 13. His monument, a fine work of statuary, is in the church which bears his name at Padua.

ANTONY, SAINT, surnamed THE GREAT, and also ANTONY OF THEBES, the father of monachism, was born about the year 251 A.D., at Koma, near Heracleopolis, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having, in obedience to what he believed to be a divine injunction, sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic Church, and formed the ideal of the monastic life. When 30 years of age, however, desirous of obtaining a deeper repose than his situation afforded, he penetrated further into the desert, and took up his abode in an old ruin on the side of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305, he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded the monastery of Fatoum, which at first was only a group of separate and scattered cells near Memphis and Arsinoë; but which, nevertheless, may be considered the origin of cenobite life. The persecution of the Christians by Maximian in 311 A.D., induced St A. to leave his cell, and proceed to Alexandria, in the hope of obtaining the crown of martyrdom; but having failed in this, he returned to his solitude in the course of a year, which, however, he soon left, and plunged yet deeper into the desert. At length he found a lodgment on a hill, about a day's journey from the Red Sea; but his disciples discovering his retreat, so pressed him with their affectionate importunities, that he ventured to accompany them back. After many pious exhortations, he once more left them, and soon became the mighty oracle of the whole valley of the Nile. In 355, the venerable hermit, then 104 years of age, made a journey to Alexandria to dispute with the Arians. He had interviews with Athanasius and other distinguished persons; but feeling his end approaching, he retired to his desert home, where he died, 356 A.D.

Athanasius states, in his Life of St A., that the hermit wore only a coarse shirt of hair, and never washed his body, which is more credible than the stories he relates of his encounters with the devil, or his miracles. His whole conduct indicates the predominance of a glowing and yet gloomy fancy, which is the proper condition of religious asceticism. Although the father of monachism, St A. is not the author of any monastic 'rules;' those which the monks of the eastern schismatic sects attribute to him are the production of St Basil. He is perhaps the most popular saint in the Catholic Church. Accounts of his life and miracles are given in the *Acta Sanctorum* of the Bollandists, under the date of the 17th January, on which day his festival was kept.

ST ANTHONY'S FIRE.—The Rev. Alban Butler, in his *Lives of the Saints*, gives the following account of the origin of this name: 'In 1089, a pestilential erysipelatous distemper, called the *sacred fire*, swept off great numbers in most provinces of France; public prayers and processions were ordered against this scourge. At length, it pleased God to grant many miraculous cures of this dreadful distemper, to those who implored His mercy through the intercession of St A., especially before his relics; the church [of La Motte St. Didier, near Vienne, in Dauphiné] in which they were deposited was resorted to by great numbers of pilgrims, and his patronage was implored over the whole kingdom against this disease.' The 'order of Canons Regular of St Anthony,' a religious fraternity, founded about 1090, for the relief of persons afflicted with the fire of St A., survived in France till 1790.

ST ANTHONY'S WELL, a small fountain near the ruined chapel of St A., on the northern slope of Arthur's Seat (q. v.), near Edinburgh. This interesting fountain, which consists only of a stone basin, into which water trickles from under an incumbent rock, is celebrated in the Scottish song—

'*O, waly, waly.*'

ANTRAIGUES, EMANUEL-LOUIS-HENRI DELAUNAY, COUNT OF, a great politician, but very ambiguous character, was born at Vivarais, in the department Ardèche, in 1765, and was educated under the Abbé Maury. His superior talents were first displayed in his *Mémoire sur les Etats-généraux, leurs Droits et la Manière de les convoquer* (1788). This book, full of daring assertions of liberty, was one of the first sparks of the fire which afterwards rose to such height in the French Revolution. In 1789, when A. was chosen as a deputy, he not only defended the privileges of the hereditary aristocracy, but also ranked himself with those who opposed the union of the three estates; while in the discussions on the constitution, he maintained that the royal *veto* was an indispensable part of good government. After leaving the Assembly in 1790, he was employed in diplomacy at St Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803 he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, entitled *A Fragment of the 18th Book of Polybius, discovered on Mount Athos.* He afterwards came to England, and acquired great influence with Canning. Despite his attachment to the interest of the Bourbons, he could never win the confidence of Louis XVIII. In 1812 he was murdered, with his wife, at his residence near London, by an Italian servant, who, immediately after the act, committed suicide.

ANTRIM, a maritime county in the north-east of Ireland, in the province of Ulster; bounded, N., by the Atlantic; W., by the north part of the river Bann, dividing it from Londonderry, and by Lough Neagh; S., by Lagan river, separating it from the county of Down; S.E., by Belfast Lough; and E. by the Irish Channel. It stands third among the Irish counties in population, but in extent only ninth. Its greatest length is 56 miles; its greatest

breadth, 20; its extent of sea-coast, 90 miles. Area, 1164 square miles. About two-thirds of this is arable; a fourth, barren; and a seventy-fourth in woods. Pop. in 1851, 352,264; 1861, 247,564; 1871, 235,936, of whom 124,823 were Presbyterians, 55,823 Roman Catholics, 46,290 Episcopalians, and the rest of other denominations. Off the north coast lie Rathlin Isle and the Skerries; and off the east coast, the Maiden Rocks. The east coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch S.W. into the interior, forming valleys opening seaward, called the Glens of Antrim. The interior slopes towards Lough Neagh. The highest eminences are—Trostan, 1810 feet; and Slievemish, or Slemish, 1782 feet. The principal streams are—the Bann, from Lough Neagh to the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into Lough Neagh; and the Bush, flowing north into the Atlantic. Many peat-bogs occur in the county. Six-sevenths of the surface consists of basaltic trap, often alternating with red ochre, and overlying hardened chalk, green-sand, new red sandstone, and mica-slate. The surface and edges of the trap-field, in some places, present basaltic columns of varied outlines. The green-sand and new red sandstone crop out on the E. and S.-E. borders, and millstone grit occurs in the N.-E. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' Causeway, is one of the most perfect examples of columnar basalt in the world. Fine salt mines occur at Duncrue and Carrickfergus; and small coal-fields near Ballycastle, and in the interior. Rich beds of iron ore of fine quality have been recently opened in Glenravel, and a large export has been carried on from Cushendall and Carnlough. The soil of A. is mostly light, and the chief crop is oats. In 1872, 254,851 acres were under crop, 86,322 being in oats, 51,178 in potatoes, and 8851 in wheat. The land is very much subdivided; and the rearing of flax, and the various branches of the linen, cotton, and coarse woollen manufacture, employ a great portion of the people. In 1872, A. had 520 National Schools, attended by 93,140 pupils, of whom 48,356 were boys, and 44,784 girls. The principal towns are—Belfast, Lisburn, Ballymena, Ballymoney, Carrickfergus, Larne, and Antrim. A. county returns two members to parliament; Belfast borough, two; and Carrickfergus and Lisburn boroughs, each one. The inhabitants are mostly Presbyterians, the county having been extensively colonised from England and Scotland. The original possessors were the O'Neills, who, partially dispossessed by John de Courcy, reappeared as chief, on the failure of his line, and in 1533, regained the whole country, except Carrickfergus and part of the Glens—held by the Bissets of Glenarm. The forfeiture of Shane O'Neill terminated the dominion of his race.

A'NTWERP (in French, ANVERS), formerly the chief city of a province in the Netherlands which was formed, in 1814, by a union of the old margravate of A. with the province of Mechlin, now the capital of the province which bears its name, and the chief commercial city of Belgium, is situate on the river Scheldt. Population (1869) 126,663. Its chief public institutions are—the Academy of Sciences, Academy of Painting and Sculpture, formerly known as the Academy of St Mark, a Medical and Surgical School, Naval Arsenal, Museum, and Zoological Gardens. The cathedral, one of the noblest Gothic structures in Europe, is 500 feet in length by 240 in breadth, with a roof supported by 125 pillars, and a very lofty spire. The interior is enriched by the two greatest of all the pictures of Rubens, the Elevation of, and the [illegible] Cross. The Church of St James c[illegible] ment of the Rubens family. [illegible] tions, recently erected, not only re th[illegible] entirely new aspect, but also rend[illegible] he c capital of Belgium one of the most str[illegible] places in Europe. The trade and [illegible] A. have recently greatly extended. [illegible] sists chiefly of sugar, white-lead, co[illegible] lace, linen-thread, carpets, gold an[illegible] es is still celebrated for its sewing-[illegible], h[illegible] stuffs, and printer's ink, as it was in for[illegible] for its velvets, damasks, and satins. [illegible] also to be mentioned tobacco-manufacture[illegible] ting of diamonds and other precious sto[illegible] building.

A. is mentioned as early as the 8th c.; i[illegible] 12th and 13th it gave signs of considera[illegible] perity, and, in 1550, numbered more [illegible] inhabitants. The union of Belgiu[illegible] in 1815 was very favourable t[illegible] and general prosperity of A. By [illegible] August 1830, it was linked to the de[illegible] When the revolutionary party gaine[illegible] commandant, General Chasse, retreated [illegible] and, exasperated by the breach of truce, [illegible] a bombardment, which destroyed the [illegible] about thirty houses. In 1832, a F[illegible] 50,000 men, under Marshal Gérard, [illegible] A., to demand the surrender of the [illegible] General Chasse refused. After co[illegible] and the loss of several lives a [illegible] General Chasse capitulated, Dec. [illegible] 30th of the same month, the Flemish [illegible] and the forts Burght, Zwindrecht, and [illegible] were surrendered to the Belgian troops. Dutch troops were taken to France, as [illegible] the surrender of the forts Lillo and [illegible] according to an article in the n[illegible] 1831, which stipulated that the [illegible] the Dutch troops in Belgium should [illegible]

ANU'BIS, an Egyptian deity, st[illegible] hieroglyphic monuments, was, according to mythology, the son of Osiris and Nephthys. By the Greeks, he was frequently styled Hermes or Hermanubis, combining the Egyptian with the Grecian name. He is represented on monuments as having the head of a jackal, with pointed ears and snout, which the Greeks frequently changed to those of a dog. Sometimes he is seen wearing a double crown. A white and yellow cock was sacrificed to him. His office, like that of Hermes Psychopompus among the Greeks, was to accompany the ghosts of the deceased into Hades (Amenthes), and there to assist Horus in weighi[illegible] their actions, under the inspection [illegible] Osiris. As, in the time of the R[illegible] worship had spread beyond [illegible] conceptions of A. and Hermes [illegible] and the dog's head of the former [illegible] the insignia of the latter.

ANVILLE, JEAN BAP[illegible] celebrated French geograph[illegible] died in 1782. He devoted [illegible] graphical science. Such [illegible] map-drawing, that his fi[illegible] authors induced him to publis[illegible] a map of Greece. His rare qu[illegible] friendship of the Abbé de So[illegible] received those instructions [illegible] of that profound and e[illegible]

subsequently acquired. He read the Greek and Latin historians and philosophers, as well as poets, specially noting the names and positions of cities and nations. He advanced the science of geography, not only by the vast number of maps which he executed, but also by the treatises, full of erudition and of historic and critical details, in which he discussed numerous interesting questions. The works of A. announced by M. de Maine many years ago, were to have been contained in six volumes, exclusive of the —lumes of maps. The principal portion was published in 1834 by Levrault. But the death of M. de ine in 1832 stopped the quarto edition near the l of the twelfth volume, to which the map of Africa however wanting, although the text had been ed. with notes digested from the most recent ations in that country. A. has left 211 maps ans, and 78 memoirs, the most of which are d in the *Recueil des Mémoires de l'Académie scriptions et Belles-lettres*. His best map is that Ancient Egypt. His *Orbis Veteribus Notus*, and *Romanus*, are also invaluable. The same k applies to his maps of Gaul, Italy, and both ancient and medieval. His maps of e ries contain all the knowledge attained . His valuable collection of maps was n 1779 by the French government for yal Library.

, a celebrated Persian poet, who uring the 12th c., was born in the pro- Khorassan, and educated at the college of at Tus. He emerged from obscurity in the of a night. The story goes that the Seljukide Sanjar, happened on one occasion to visit when the imagination of the youthful poet was cited by the presence of the monarch and his ring retinue, that he resolved to write a poem praise. By next morning, it was finished, and ated to Sanjar, who instantly placed the fortu- youth among his courtiers. A. now began to himself to astrology, which was his ruin; for having predicted that in 1185 or 1186 A. D. a hurricane would burst over all Asia, overthrow the most solid edifices, and shake the very mountains, and nothing of the sort really occurring, but, on the contrary, an entire year of remarkably tranquil weather, he fell into disgrace, and had to retire to Balkh, where he died in 1200—1201 A. D.

His poems consist chiefly of lengthy panegyrics, and shorter lyrical effusions. The latter (*ghazels*) are characterised by simplicity, ease, and naturalness; but the *kasidas*, or long poems, are disfigured, like many other eastern poems, by glittering imagery and historical conceits. His *Elegy on the Captivity of Sanjar taken Prisoner by the Ghurides*, has been translated into English by Captain Kirkpatrick in the 1st volume of *Asiatic Miscellanies* (Calcutta, 1785).

A'ORIST, a form of the Greek verb by which an action is expressed as taking place in an indefinite (Gr. *aoristos*) time. The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages - namely, the imperfect, perfect, and pluperfect - the A., which is peculiarly adapted to the narrative style of writing. The distinction of first and second A. is purely formal.

AO'RTA is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The A. in man is subdivided by anatomists into the Arch, the Thoracic A., and the Abdominal A. The *arch* is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the second piece of the breast-bone, and then descending to the left side of the third dorsal vertebra. Five arteries arise from the arch—viz., two coronaries, for the supply of the muscular tissue of the heart itself; the innominata; and the left carotid and left subclavian arteries. At the commencement of the arch are three small swellings or

Aorta:

a, ascending arch of aorta; *aa*, coronary arteries; *b'*, innominata artery; *b*, right subclavian; *c*, right carotid; *d*, left carotid; *e*, left subclavian; *f*, thoracic aorta; *gg*, diaphragm; *hh*, phrenic arteries; *i*, coeliac axis; *k*, coronary or gastric; *l*, splenic; *m*, hepatic; *n*, superior mesenteric; *oo*, renal arteries; *p*, inferior mesenteric; *p'*, spermatic; *q*, common iliac; *r*, middle sacral.

pouches, the aortic sinuses, below which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood back into the heart. The *thoracic A.* extends from the third dorsal vertebra to the diaphragm, gradually getting into the middle line of the spine. The thoracic A. gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (ten on left, and nine on right side). The *abdominal A.* passes from the diaphragm to the fourth lumbar vertebra, opposite the lower margin of which it divides into the two common iliac trunks. The abdominal A. gives off the two phrenic arteries to the diaphragm; the cœliac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric for the small, and part of the large intestine; the *renals* (two); the *supra*-renals (two), one for each kidney; the spermatic; the inferior mesenteric, for the part of the large intestine not supplied by the superior mesenteric; and four or five lumbar arteries, which supply the lower part of the abdominal walls (the loins).

Where the A. bifurcates, a small artery, the *sacra-media*, or *caudal* artery, arises, and passes along in the middle line; in fish and in animals with large tails, this branch is a continuation of the A.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the A. will be given under ARTERY; and the comparative anatomy under HEART and CIRCULATION.

During fœtal life, there is a communication between the arch of the A. and the pulmonary artery called the *ductus arteriosus*, the canal of which becomes obliterated after birth. It has been calculated that the velocity of the blood in the ascending part of the arch is 2½ inches in a second. The pressure of the blood in the A. of a horse has been estimated to be 11 pounds; and in man's, 4 pounds 6 ounces.

The coats of the A. are very subject to fatty disease termed Atheronia (q. v.), and in advanced life, to calcareous degeneration or deposit of earthy particles, which destroys their elasticity. This change renders them very liable to Aneurism (q. v.), which, as may be expected, is generally situated at the curves of the A., especially at the arch. Sufferers from this disease in the arch or thoracic A., suffer from palpitation within the chest, difficulty of breathing, occurring in paroxysms and during sleep, and shoots of pain through the chest. If the aneurism is on the arch, it generally presses forward, and may completely destroy the breast-bone, forming a pulsating tumour, covered only by the skin, or it may press up into the neck. If low in the chest, the aneurism may compress the thoracic duct, and cause emaciation. In the abdomen, the symptoms are pulsation and pain; but in both situations aneurism may exist for a length of time without attracting attention.

In some cases, the A. has been found obliterated, shewing that the lower extremities can be supplied with blood by the anastomosing branches. Sir Astley Cooper and other surgeons have tied the A. for aneurism, but without success.

AOSTA, a district of the province of Turin, in North Italy, surrounded by the highest elevations of the Alps, and watered by the river Dora-baltea. It contains an area of 1233 square miles. The dense pine-woods on the hills, the alpine pastures on the slopes, the plantations of vines, almonds, olives, figs, and mulberry trees in the valleys, and the ores of silver, copper, and iron in the bosom of the mountains, supply occupation and means of subsistence to a population of about 83,000; but the land generally is not adapted to the growth of corn, though maize, barley, oats, &c., are produced in the lowest portions of the valleys. The disease styled Cretinism (q. v.) prevails to a lamentable extent, and few persons are altogether free from Goitre (q. v.). Great numbers of the poorer class emigrate during winter into the richer countries in their vicinity, and earn a livelihood as chimney-sweepers, masons, and smiths.—AOSTA, the principal town, 49 miles N.N.W. of Turin, contains 7700 inhabitants, and has a large trade in cheese, hemp, leather, &c. It was in ancient times the chief residence of the Salassi, a brave race of mountaineers, with whom Appius Claudius (134 B. C.) had to contend on his way into Gaul. They were finally destroyed by Terentius Varro in the time of Augustus. Monuments of the Roman times—a well-preserved arch, two gateways, the ruins of an amphitheatre, and a bridge—still remain. The celebrated baths and mines of St Didier are in the neighbourhood. St Bernard, the founder of the famous hospice which bears his name, was Archdeacon of A.; and Anselm, Archbishop of Canterbury, was born here.

APA'FI, MICHAEL I., Prince of Transylvania, was born in 1632, of an old but decayed family. He accompanied Prince George II. in an expedition against the Poles in 1656, but was taken prisoner at the irruption of the Tatar hordes under their khan, Mohammed Girai. After his release, he went and lived for a short time at his paternal estate; but in 1661 he was chosen Prince of Transylvania, at the instigation or desire of Ali Pasha, generalissimo of the Turkish forces under [illegible] IV. During the peace concluded [illegible] peaceably under the protec[illegible] acquired the towns of Clausenburg [illegible] mar. He remained faithful to the [illegible] till the siege of Vienna in [illegible] changed. The imperial troops [illegible] country; and on the 12th of A[illegible] a treaty with the emperor at L[illegible] Transylvania was declared to be fr[illegible] from Turkish suzerainty, and placed under [illegible] protection. At Fogaras, on the 1st of July the Transylvanian deputies assembled [illegible] national Diet, took the oath of fealty to burgs as legitimate monarchs of E[illegible] since the death of his wife, Anna Bor[illegible] A. had been sorely afflicted both in [illegible] and died (April 15, 1690) on the eve of a butive war, commenced by his old allies who considered themselves ill used by him of them. His son, Michael II., succeeded throne and its perils. The Turks, [illegible] Cuprigli, overthrew the imperial [illegible] several places, such as Nissa, Wi[illegible] Belgrade, &c.; but the intestine [illegible] Ottoman empire hindered them, [illegible] Tekeli, the adventurer whom they [illegible] from retaining these towns. The imperial [illegible] subsequently regained everything; and a[illegible] young Transylvanian prince was inve[illegible] and cajoled into giving up his d[illegible] in lieu of a pension of 12,000 or [illegible] died in 1713.

A'PANAGE is not an English l[illegible] a technical word in the French [illegible] system it signifies the assignment or [illegible] the crown of lands and feudal rights to of the royal family, that they may be [illegible] maintain themselves according to their rank a long article on this subject in K[illegible] *Dictionary*, which refers to R[illegible] *Staats-Lexicon*, art. by P. A. [illegible] Merlin's *Répertoire de Jurisprudence* head.) The word A., however, is sc Scotch law-books, the Scotch law[illegible] probably derived it from France, [illegible] laws was so largely imported into Sc[illegible] of Session itself having been model[illegible] of the Parliament of Paris. Mr Erskine *ciples of the Law of Scotland*, book i. [illegible] says: 'The *A.*, or patrimony of the P[illegible] land, has been long erected into a r[illegible] tion, called the principality. It is [illegible] king's eldest son, upon whose death [illegible] returns to the crown. The prince has [illegible] his own chancery, from which his writs may have his own chamberlain and oth[illegible] for receiving and managing his revenue.' late Professor Bell, in his *P[illegible]iples Law*, calls this principality "[illegible]nce A. and personal provision." [illegible] of Cornwall may be said to be [illegible] of Wales, in whose person, also, [illegible] of the two kingdoms under the [illegible] merge the rights of the Prince [illegible] royal highness, in fact, when he [illegible] strictly to be called, not Prince of [illegible] of Scotland.

In common parlance in England [illegible] loosely used to denote any extra-te[illegible] tion or sovereignty by governmen[illegible] even any dignity or right enjoy[illegible] rank.

A'PATITE is the scientific and [illegible] applied to a mineral mainly consi[illegible]

of lime (bone-earth), and which for some years past has been largely used in the preparation of manures. It is employed for the same purpose as bones or bone-ash—namely, to supply phosphoric acid to the soil. The massive radiated variety is sometimes called *phosphorite*, and when massive, earthy, and impure, it is also known as *osteolite*. Coprolites (q. v.), or phosphatic nodules, are likewise mainly composed of phosphate of lime. A. is found as a bedded rock, in compact spheroidal masses, in veins and dykes, and as an accessory constituent of rocks. It exists in nearly all geological formations, but is perhaps most abundant in the older metamorphic rocks. Extensive deposits of A. occur in various parts of the world. From Krageroe in Norway, where it occurs associated with granitic rocks, and from Estremadura in Spain, where it is found in cretaceous strata, it has been largely sent to England, the total imports of these mineral phosphates having in some years reached 50000 tons. There is a bed of A., 18 inches thick, of Silurian age at Llanfyllin in North Wales, which has been extensively worked. A remarkable deposit of a variety of A., or rather rock guano, which has been described as 'Sombrerite,' was discovered some years ago on the small island of Sombrero, situated about 60 miles to the east of St Thomas, in the West Indian group. It covers a great part of the island, which is about 1½ miles long, by ⅓ths of a mile in breadth. A. A. Julien, writing from the spot in 1864, states there 'is a natural division of the Sombrero into two varieties. One of an oolitic structure, of a great variety of colours, and containing, in addition to the bone ($3Ca_3O_2P_2O_5$) and neutral ($Ca_2P_2O_5$) phosphates of lime, the phosphates of alumina, iron, and magnesia, &c. The other variety, generally of a broad concretionary structure, is of a white or yellowish-white colour, containing a little carbonate of lime, sulphate of lime, &c., but especially abounds in bone phosphate of lime. It is almost certain that the former more nearly resembles the original deposit, and is the older of the two; while the latter is far more uniform in composition. The guano is interlaminated with ordinary coral limestone.' It is now believed that this hard or rock guano has been formed by water filtering through ordinary guano, into the coral rock adjoining, and turning it more or less completely into phosphate of lime. A similar hard guano occurs at Monk's Island, and one or two others in the Caribbean Sea. Large quantities have been introduced into this country, and still more into the United States, under the name of Sombrero Guano, and are extensively employed by the manufacturers of artificial manures, in place of ordinary bone-ash. The general treatment to which mineral phosphate is subjected, is to reduce it to powder, and act upon the pulverised matter with sulphuric acid, which renders the phosphoric acid in the A. soluble in water, and thereby facilitates its introduction into the plant. These substances require to be ground to a finer powder, and subjected to a more protracted digestion than bones. In the greater number of cases where the A. or Sombrero Guano is treated in this way, it is mixed with other manures, such as Peruvian Guano, blood, or true bones, and thus a complex substance is manufactured, which is much more acceptable to the plant than the simple A. or *mineral phosphate* itself. The great importance of mineral phosphate, in an agricultural point of view, arises from the fact that no mineral substance possesses more influence over the growth of the edible plants, such as wheat, barley, oats, turnips, &c., than phosphoric acid does; any cheap source of that substance, therefore, is a great boon. The island of Sombrero contains as much phosphatic or bony matter as is present in many millions of oxen, and represents as much manure as would be obtained by the employment of the bones of these cattle. The different varieties of A. contain a little fluoride or chloride of calcium, or both, as well as phosphate of lime. Of these varieties, besides those already mentioned, there are others, as *Moroxite*, *Francolite*, and *Asparagus Stone*. It occurs both massive and in crystals—which are generally small, and are often six-sided prisms, or six-sided tables, but some very large ones have been brought from Canada. It occurs in some of the tin mines in Cornwall, Saxony, Bohemia, &c., and in rocks of various ages, as mentioned above. It is found of various colours, more or less green, blue or red, sometimes white, and often gray. The proposal to employ it as a manure first excited much interest in 1856, and began to be enterprisingly carried into effect, with happy results—rocks once deemed most barren being thus rendered conducive to the fertility of soils. In Spain, A. is used as a building stone.

APE, a name commonly given to the tailless monkeys. (See BARBARY APE, CHIMPANZEE, GIBBON, GORILLA, ORANG-OTANG, &c.) It was originally commensurate in signification with monkey, and the terms were indiscriminately used. The origin of the word is uncertain. See MONKEY.

The worship of apes or monkeys has been common among pagan nations from a period of remote antiquity, and still prevails very extensively, being practised in Japan, in India, and by some of the African tribes. The source of it is perhaps to be found partly in the doctrine of the transmigration of souls, and partly in the qualities which apes have been supposed to possess in a conspicuous degree, and of which they have been made symbolic. An A.'s tooth, kept in a temple in Ceylon, was regarded with extraordinary veneration, and immense wealth was accumulated through the continual offerings of the worshippers; but the temple was plundered, and the tooth carried away by the Portuguese in 1554.

A-PEAK, or A-PEEK, a maritime term signifying the position of an anchor when the cable has been drawn so tight as to bring the ship directly over it; the sailors then say that 'the anchor is a-peak.'

APE'LLES, the most celebrated painter in ancient times, was the son of Pythias, and was probably, in accordance with the statement of Suidas, born at Colophon, on the Ionian coast of Asia Minor; though Pliny and Ovid call him a Coan, and Strabo and Lucian an Ephesian. This, however, may simply refer to the fact that he was made a burgess of that town. He flourished in the latter part of the 4th c. B.C., received his first instruction in art in the Ionian school of Ephesus, then studied under Pamphilus of Amphipolis, and latterly at Sicyon, under Melanthius, and thus he united the fine colouring of the Ionian with the accurate drawing of the Sicyonic school. During the time of Philip, A. visited Macedon, where he became the intimate friend of Alexander the Great. It was probably at the Macedonian court that the best days of A. were spent. Pliny relates that on one occasion when Alexander visited A. in his studio, the king exhibited such ignorance of art, that A. recommended him to be silent, as the boys who were grinding the colours were laughing at him. But the same story is told of Zeuxis and Megabyzus. He afterwards visited Rhodes (where he was familiar with Protogenes), Cos, Alexandria, and Ephesus. The period of his death is not known; but as he practised his art before the death of Philip, and as his visit to Alexandria was after the assumption of the regal title by Ptolemy, he probably flourished between 352 and 306 B.C. The most celebrated paintings of

A. were his Anadyomene, or Venus Rising from the Sea, with a shower of silver drops falling round her like a vail of gauze, the Graces, and similar subjects; but he cultivated the heroic as well as the graceful style. His ideal portrait of Alexander wielding a thunderbolt was highly esteemed, and preserved in the temple of Diana at Ephesus. With reference to this painting, Alexander said: 'There are only two Alexanders—the invincible son of Philip, and the inimitable Alexander of A.' A. is said to have left an incomplete painting of Venus, to which no other painter would presume to give the finishing-touches. The disposition of A. was remarkably free from envy, and he willingly acknowledged the merits of his contemporaries. Amphion, he said, excelled him in grouping, and Asclepiodorus in perspective, but *grace* was his alone. On coming to Rhodes, and finding that the works of Protogenes were not appreciated by his countrymen, he at once offered him fifty talents for a picture, and spread the report that he intended to sell it again as his own. The industry with which he practised drawing was so great as to give rise to the proverb, *Nulla dies sine linea*. Many other anecdotes are related of A. When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is said that A. instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to the shoes; or, in the Latin version, which has become proverbial, 'Ne sutor supra crepidam.'

A'PENNINES (Ital. *Appenni'ni*; anciently, Lat. *Mons Apenninus*), a mountain-chain extending uninterruptedly throughout the whole length of the Italian peninsula. It lies between 37° and 44° 30′ N. lat., and 7° 40′ and 18° 20′ E. long., and belongs to the system of the Alps, from which it branches off at the Col de Tenda, near the sources of the Tanaro. From this point, the chain, under the name of the Ligurian A., girdles the Gulf of Genoa, in the immediate vicinity of the sea, and then runs inland to a considerable extent, forming the watershed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a south-western direction through Naples, dips under the sea at the Strait of Messina, and reappears on the northern coast of Sicily. Recent geographers divide the A. as follows: 1. *The North A.*, from the Col de Tenda in the Maritime Alps to the pass of Borgo San Sepolcro, in the neighbourhood of Arezzo, on the eastern border of Tuscany. 2. *The Central A.*, from Arezzo to the valley of the Pescara, which flows between the two Abruzzi. 3. *The South A.*, from the valley of the Pescara to Cape Spartivento. 4. *The Insular A.*, or the Sicilian range. The leading feature of the A., wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long terraced plateaus, lower ranges, and finally, extensive coast-plains, mark their gradual descent on the west. The general name for these lower ranges is *Sub-Apennine;* but they have a variety of particular designations, such as, the Mountains of Carrara and Seravezza, Pratomagno and Monte Amiata, in Tuscany; the Sabine, Alban, and Volscian mountains, in the former Papal States; Monte Gargano on the south-east coast, north of Manfredonia, &c. The main chain of the A. does not send off spurs into the Apulian peninsula, or heel of Italy, which, for the most part, is rather level, or only interspersed with detached groups of hills.

The direction of the great chain of the A. is favourable to the formation, on the west side, of important river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while, on the east side, we find nothing but small streams, in most cases, destitute of affluents, hurrying down to the sea through wild precipitous valleys. In Northern Italy, the Ligurian A., almost overhanging the Gulf of Genoa, can only develop on the south puny streams, while the north sends down, through the plains of Piedmont, large tributaries to the Po.

The average height of the entire chain of the A. is about 4000 feet, which, however, in the north, sinks down to little more than 3500 feet; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range, known under the name of Gran Sasso d'Italia, they reach an elevation of 10,200 feet, and in Monte Velino, of 7850 feet. The North A. attain, in Monte Cimone, situated in the south of Modena, a height of 6973 feet; the South A., in Monte Amaro, a height of 9000 feet; the Insular A., if we exclude the isolated peak of Ætna—in Pizzo di Cane, a height of 6500 feet.

The A. are crossed by thirteen principal passes: these are, proceeding from N. to S.—1. The Pass of Savona; 2, of Bocchetta; 3, of Cisa; 4, of Monte Cimone; 5, of Porretta; 6, of Pietramala; 7, of Borgo San Sepolcro; 8, of Furlo; 9, of Serravalle; 10, of Aquila; 11, of Isernia; 12, of Arpino and Troja; 13, of Potenza. The prevalent stone is a species of compact limestone, of a whitish-gray, belonging to the Jura formation. Resting on limestone is found a more recent formation of stone and marl, which is especially ... middle region of the Sub-A., contains ... nary number of petrifactions, and must be as belonging to the upper division of the limestone. Older formations, however, crop out. Thus, for instance, on the waters the North and Central A. there are found tra clay-slate, grauwacke-slate, &c. The A... ally the Roman and Neapolitan, are disti from all other mountain-chains by the rich of marbles which they contain. In s the quarries seem inexhaustible. RA'DE, a town in the Prussian province g-Holstein, situated at the bottom of a he Little Belt, has an excellent harbour, nsiderable amount of shipping. Long. 9° ; lat. 55° 2' 46" N. Pop. (1871) 5932. rons of the town are beautiful. The first mention made of A. relates to its destruc- ie Slaves in 1148; and, indeed, its position s laid it open to the casualties of northern ther on a large or small scale, as has been seen since 1848. Near the town stands of Brundlund, built by Queen Margaret in hich the bailiff of the place resides.

ALOUS, a term in Botany, applied to r to flowering plants, and signifying that destitute of petals or corolla (q. v.). When alyx and corolla are wanting, the flower is *achlamydeous* (from the Greek *chlamys*, a or naked. The absence of the whorl of s occurs in an exceptional manner es genera ordinarily characterised by its In some plants, as in certain species of f *Caryophyllaceæ*, petals are sometimes sometimes absent, a tendency apparently o the suppression of this whorl.

ION, that point in the elliptical orbit of which is most remote from the sun. The oint, or that nearest to the sun, is styled HELION. At the former point, the swiftness lanet's motion is least, and begins to at the latter, it is greatest, and begins se. This irregularity of motion is most le in comets whose orbits deviate most ircle. The motion of the comet of 1680, ihelion, was calculated as 137,000 times d than its motion in A. See APSIDES.

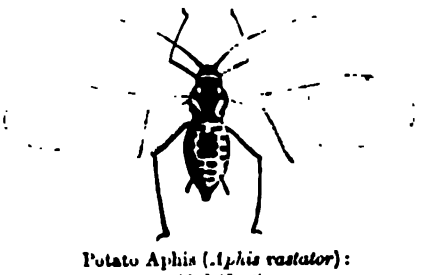
a genus of insects belonging to the order a sub-order Homoptera the type of a lled *Aphidii*. They are small insects,

Apple Aphis (*Eriosoma Mali*):
insect, magnified; *b*, wingless insect in excrescence of the tree, magnified.

sucking the juices of plants, upon which be seen congregated in immense numbers, ng a nous injury, causing the distortion of d even the blight and decay of the plant. ly Aphis, or American Blight (*A. lanigera*; *Mali* of Leach), is sometimes very injurious to apple-trees, and when once it has found its way into a garden or orchard, is very difficult of removal. It is a minute insect, 'covered with a long cotton-like wool, transpiring from the pores of its body'—

Apple Aphis:
a branch with excrescences, reduced.

'a cottony excretion'—in which it differs from the ordinary aphides, and takes its place in the chinks and rugosities of the bark, multiplying rapidly, extracting the sap, causing diseased excrescences, and, ultimately, the destruction of the tree. It was first observed in England in 1787; but it is uncertain if it was, as has been supposed, accidentally imported from America. The Hop-fly (*A. Humuli*), and the A. of the turnip and cabbage (*A. Brassicæ*), have sometimes caused the destruction of entire crops. The price of hops varies from one year to another, very much according to the numbers in which '*the fly*' has appeared. The potato A. (*A. vastator*) has been represented as the cause of the



Potato Aphis (*Aphis vastator*):
magnified fifty times.

potato disease; but this opinion has few supporters. The aphides of the rose (*A. Rosæ*) and of the bean (*A. Fabæ*) are among the most familiarly known. Every one must have observed the leaves of trees and shrubs deformed by red convexities. In the hollows of the under side of these, aphides have their habitation, and there they find their food; the exhausted leaf at last curls up. Most of the species are green; the A. of the bean is black. They are generally called Plant-lice. They have a proboscis (*haustellum*), by which they pierce and suck plants; and at the extremity of the abdomen, two horn-like processes, from which exude frequent small drops of a saccharine fluid called *Honey-dew*, a favourite food of bees and ants. It has been seen even to fall in a kind of shower from trees much covered with aphides. Mention has been made in the article ANT, of the means which ants take to obtain this food. The legs of aphides are long, and they move slowly and awkwardly by them. The greater number of them never have wings; it is in the autumn that perfect winged insects generally appear. From the pairing of these result eggs, which produce female aphides in the following spring, and successive generations of wingless aphides are produced in a

viviparous manner without impregnation throughout the summer, the rapidity of multiplication being prodigious. Their increase, however, is restrained not only by birds, but by insects which feed on them. A family of coleopterous insects, to which the genus *Coccinella* or Lady-bird (q.v.) belongs, has received upon this account the name of *Aphidiphagi*, or aphis-eaters. There are also certain minute hymenopterous insects, which destroy them in great numbers by depositing their eggs in them; the larva feeds upon the living A., out of which it at last eats its way, leaving a mere desiccated skin.

A'PHORISM, a maxim, or any short and significant saying; such as, 'Custom is a second nature.' A whole piece or work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. In certain circumstances this aphoristic style has an impressive effect; but long continued, it becomes wearisome.

APHRODI'TÉ, the Greek name of Venus, according to various traditions, is derived from *aphros* (foam), in allusion to the old poetical myth which represented the goddess as springing from the foam of the sea. See VENUS and APELLES. *Aphrodisia* were festivals celebrated in honour of A., in numerous cities of Greece, but especially in Cyprus. At Paphos, in this island, was her most ancient temple. Bloodless sacrifices alone were imagined to please A., such as flowers, incense, &c. Mysteries of an impure kind formed part of the ceremonial of the aphrodisia. Aphrodisia were no doubt held in the other places where A. was worshipped, such as Cythera, Sparta, Thebes, Elis, &c., though they are not mentioned. At Corinth and Athens, the aphrodisia were celebrated principally by prostitutes.

APIA'CEÆ. See UMBELLIFERÆ.

APIACERE. See AD LIBITUM.

A'PIARY. See BEE.

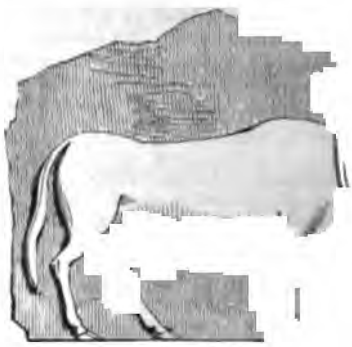
API'CIUS, a Roman epicurean—in the low and common sense of the word—lived in the times of Augustus and Tiberius, and was celebrated for his luxurious table and his acquirements in the science of cookery. When, in pursuit of his favourite study, he had consumed the greater part of his fortune, and had only some £80,000 left, he poisoned himself, in order to avoid the misery of plain diet. Two other gourmands—one in the time of Pompey, the other in the reign of Trajan—are mentioned under the name A. The Roman cookery-book, *Cælii Apicii de Obsoniis et Condimentis, sive de re Culinariâ* (libri decem), ascribed to A., obviously belongs to a much later time, inasmuch as it abounds in inaccuracies and solecisms. The unknown author has thought proper to recommend his work to gourmands by affixing to it the celebrated name of A.

A'PION, a Greek grammarian, was born at Oasis, a town in Libya, but educated in Alexandria, which he affected to consider his birthplace, from a desire of being thought a pure Greek. He studied under Apollonius, the son of Archibius, from whom he acquired an admiration of Homer, and afterwards went to Rome, where he succeeded Theon as teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge. He declared that himself, and every one whom he mentioned, would be held in immortal memory, that he was equal to the first philosophers of Greece, and that Alexandria should be proud of him. On account of his incessant bragging, Tiberius used to call him *Cymbalum Mundi* (the cymbal of the universe).

With the exception of one or two fragments, the whole of A.'s numerous writings are lost. He composed a work on the text of Homer, in form of a dictionary, which was freque to by subsequent authors; a work on contained the far-famed story of *A Lion*, preserved by Aulus Gell the Jews; one in praise of another on the great epicurean various countries, &c.

A'PIOS TUBERO'SA, formerly genus *Glycine*, and called *G. Apios*, to the natural order *Leguminosæ*, sub *onaceæ*, having tuberous roots, a twini red flowers, leathery, 2-valvular legume leaves, with seven pair of smooth ovato-la leaflets. This plant, which is a native of has for a century been cultivated in botanic in Europe, and has recently been br ticular notice on the continent, in a through the French traveller Lamare during his travels in North Ame himself of the value of the tubers as an food, for which they are there used to som Various attempts have since been made to it like the potato; but its cultivation cult, upon account of the length and w twining shoots and the length of tubers cooked in steam are free fr bitterness, and very much resemble in the same way. They contain more nitro potatoes (4·5 per cent.), also more starch (33·55 according to an analysis by Payen).

A'PIS, the bull worshipped by the anci tians, who regarded it as a symbol of Osiris of the Nile, the husband of Isis, and the great of Egypt. A sacred court or yard w for the residence of A. in the temple Memphis, where a numerous retinue of upon him, and sacrifices of red oxen were him. His movements, choice of places, and of appetite, were religiously regarded as



Apis.—Golden

was an understood law that A. must not than twenty-five years. APO'CALYPSE. See REVELATION OF ST JOHN.

APOCALY'PTIC NUMBER is 'the mystical 666, spoken of in the book of Revelation 18). As early as the 2d c., the Church had that the name, Antichrist, was indicated by Greek characters expressive of this number; others believed it to express a date. The probable interpretation is that which was at in the days of Irenæus, and which found number in the word *Lateinos* (*Latinus*). The nation—the mightiest pagan power on earth the most terrible symbol of Antichrist, and er 666 appears in the Greek characters the name. Protestant controversialists really support their views by this interpre- applying the prophecy to papal Rome.

APOCA'RPOUS FRUITS, in Botany, are those which are the produce of a single flower, and formed of only one carpel, or of a number of els remaining free and separate from each other. term is derived from the Greek *apo*, implying tion, and *carpos*, fruit.

A POCO A POCO (Ital.), in Music, by degrees; little and little.

APOCRE'NIC ACID is one of the products of the natural decay of wood and other plant textures, and is found wherever lignine or woody fibre is decomposing in soils, &c. As A. A. is soluble in water, it follows that rain-water falling on and percolating through soils containing this substance, becomes impregnated with it; and hence, in many natural waters, A. A. is a recognised constituent. A. A. performs an important function in the growth of plants, as there is every reason to believe that it forms one of the stages through which matter travels from dead plants again into the living vegetable tissue.

APO'CRYPHA, or APOCRYPHAL WRITINGS. The word originally meant *secret* or *concealed*, and was rendered current by the Jews of Alexandria. In the earliest churches, it was applied with very different significations to a variety of writings. Sometimes it was given to those whose authorship and original form were unknown; sometimes to writings containing a hidden meaning; sometimes to those whose public use was not thought advisable. In this last signification, it has been customary, since the time of Jerome, to apply the term to a number of writings which the Septuagint had circulated amongst the Christians, and which were sometimes considered as an appendage to the Old Testament, and sometimes as a portion of it. The Greek Church, at the Council of Laodicea (360 A.D.), excluded them from the canon; the Latin Church, on the other hand, always highly favoured them; and finally the Council of Trent (1545—1563) placed them on an equality with the rest of the Old Testament. The Church of England uses them in part for edification, but not for the 'establishment of doctrine.' All other Protestant churches in England and America reject their use in public worship. But it was once customary to bind up the A. between the authorised versions of the Old and New Testaments, though this has now ceased, and, as a consequence, this curious, interesting, and instructive part of Jewish literature is now known only to scholars. The Old Testament A. consists of 14 books: 1. First Esdras (q. v.); 2. Second Esdras (q. v.); 3. Tobit (q. v.); 4. Judith (q. v.); 5. The parts of Esther not found in Hebrew or Chaldee; 6. The Wisdom of Solomon; 7. The Wisdom of Jesus, son of Sirach, or Ecclesiasticus (q. v.); 8. Baruch (q. v.); 9. The Song of the Three Holy Children; 10. The History of Susanna; 11. The History of the Destruction of Bel and the Dragon (q. v.); 12. The Prayer of Manasses, King of Judah (see MANASSEH); 13. First Maccabees (q. v.); 14. Second Maccabees (q. v.). The precise origin of all of these writings cannot be ascertained. It is enough to state here that some bear traces of a Palestinian, others of an Egypto-Alexandrine, and others, again, of a Chaldaico-Persian origin or influence. Most, if not all, bear internal evidence of having been composed in the 1st and 2d centuries B.C.

The A. of the New Testament may be arranged under three heads. 1. The writings comprising the *Apocryphal Gospels*, which consist of 22 separate documents, 10 in Greek and 12 in Latin. They concern themselves with the history of Joseph and of the Virgin Mary before the birth of Christ, with the infancy of Christ, and with the history of Pilate. The most important of the set are the *Protevangelium of James*, the *Gospel of Thomas*, and the *Acta of Pilate*, which are perhaps the *origines* of all the apocryphal traditions. That many of the stories found in these were current in the 2d century, is abundantly proved, but we have no evidence that any of the books known as Apocryphal Gospels were then in existence, or are older than the 4th century. 2. The *Apocryphal Acts of the Apostles*, consisting of 13 documents originally written in Greek, but found also in a Latin compilation probably of the 6th century. They are distinguished from the Apocryphal Gospels by having less of miracle and more of didactic discourse. The more important of the collection are *The Acts of Peter and Paul*, *The Acts of Barnabas*, *The Acts of Philip*, *The Acts of Andrew*, *The Acts of Bartholomew*, and *The Acts of John*. It is difficult to ascertain their age. Some are probably of earlier date than the Apocryphal Gospels, but the original MSS. are lost, and we only possess them in late transcripts of the middle ages. 3. The *Apocryphal Apocalypses*, consisting of seven documents, four of which are called apocalypses by their authors. There is great and perplexing variety in the MSS. That called *The Apocalypse of Moses* relates rather to the Old Testament than to the New; so does *The Apocalypse of Esdras*, which is a weak imitation of the Fourth Book of Esdras. The others are *The Apocalypse of Paul*, *The Apocalypse of John*, and *The Assumption of Mary* in three forms. These, too, only exist in late MSS. of the middle ages, and it is, of course, not quite certain that they are the same in form as the works bearing the same name referred to in the writings of the Fathers.

The New Testament A. is not without interest or instruction for us. It throws a flood of light upon the workings of the early Christian consciousness and modes of thought, and it also enables us to appreciate the vast superiority of those Scriptures which have obtained canonical authority. See Tischendorf's *Prolegomena* to the Apocryphal Literature of the New Testament (Leipsic, 1873); and Clark's *Ante-Nicene Christian Library*, vol. 16 (Edinburgh, 1870).

APOCYNA'CEÆ, or **APOCY'NEÆ**, a natural order of Dicotyledonous plants, consisting of trees and shrubs, generally with milky juice, having entire leaves, and no stipules. The calyx is usually 5-partite, persistent; the corolla hypogynous, monopetalous, often with scales in its throat, regular, 5-lobed, twisted in bud. There are five stamens, which are inserted on the corolla; the anthers adhere firmly to the stigma, to which the pollen is immediately applied; the anthers are 2-celled, and open longitudinally; the pollen is granular. The ovaries are two, each 1-celled, or one, which is 2-celled; ovules usually numerous; styles 1 or 2; the stigma is contracted in the middle, and peculiarly characteristic of the order. The fruit is a follicle or capsule, or drupe or berry, double or single. The seeds have a fleshy or cartilaginous albumen, or (rarely) are ex-albuminous.—There are about 566 known species, chiefly natives of tropical countries. The PERIWINKLE (q. v.) is its only representative in the flora of Britain, a wanderer, as it were, from the tropics, yet hardly enough for the climate with which it has to contend; the OLEANDER (q. v.) and a few others are found in the south of Europe. Many species are poisonous; amongst which is the noted TANGHIN (q. v.) or TANGHENA of Madagascar. Some are used in medicine, in India and other countries. A number of species yield CAOUTCHOUC (q. v.). The milk of others is bland and wholesome, as the HYA HYA or COW-TREE (q. v.) of Demerara. Some are used in dyeing; *Wrightia tinctoria* yields indigo of good quality.—A number yield eatable fruits, as *Willughbeia edulis* and *Carissa Carandas* in India; *Carissa edulis* in Arabia, and certain species of *Carpodinus*, called PISHAMIN in Sierra Leone, and *Hancornia*.—*Apocynum cannabinum*, Canadian hemp, a herbaceous plant about 4—5 feet in height, with unbranched stem, oblong leaves, and lateral cymes of whitish bell-shaped flowers, yields a very strong fibre, which the Indians of North America employ for making twine, cloth, fishing-nets, &c.

A'PODAL FISHES are fishes destitute of ventral fins. In the Linnæan system, the *Apodes* are an order of Fishes, in which genera not otherwise nearly allied are brought together; but in the systems of Cuvier and other recent naturalists, a less important place is assigned to this distinctive character.—Eels are an example of A. fishes.

APODI'CTIC, a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No A. judgment can be founded on experience, because experience does not supply the idea of an absolute necessity.

A'POGEE (Gr. *apo*, from, and *ge*, the earth), properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's A. corresponding to the earth's aphelion, and the moon's A. being the point of its orbit most remote from the earth. A. is opposed to perigee.

APOLLINA'RIS, the Younger, Bishop of Laodicea in Syria (362), and one of the warmest opponents of Arianism. Both as a man and a scholar, he was held in the greatest reverence; and his writings were extensively read in his own day. His father, A. the Elder, who was presbyter of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavoured to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. It is not ascertained what share the father had in this work, but as he had a reputation for piety, he probably put the Old Testament into Greek verse. But it was chiefly as a controversial theologian, and as the founder of a sect, that A. is celebrated. He maintained the doctrine that the *logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualised and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread itself rapidly in Syria and the neighbouring countries, and, after the death of A., divided itself into two sects—the Vitalians, named after Vitalis, Bishop of Antioch; and the Polemeans, who added to the doctrine of A. the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration. On this account, they were accused of *sarcolatria* (worship of the flesh) and *anthropolatria* (worship of man), and also were styled *synousiastoi* (*syn*, together, and *ousia*, substance), because they confused together the two distinct substances. The whole controversy, which occupied a great part of the 5th c., is an instance of human reason wandering out of its proper sphere. A. must not be confounded with Claudius A., Bishop of Hierapolis, in Phrygia (170 A. D.), and who wrote an *Apology* for the Christian faith, and several other works, all of which are lost.

APO'LLO (Gr. APOLLON). A. may be regarded as the characteristic divinity of the Greeks, much as he was the impersonation of [illegible] its most beautiful and natural forms, [illegible] representative of the Grecian nation. [illegible] worship, with its many festivals, accompanied they were by a cessation from all hostilities, various shrines at sacred places, with their oracles and the general idea of his character had a powerful, and beneficent influence on [illegible] tical life throughout the states of [illegible] and Hesiod mention that he was [illegible] and Leto, but neither states [illegible] The Ephesians believed that both [illegible] and sister, were born in a grove near their [illegible] Tegyræans of Bœotia, and the inhabitants [illegible] in Attica, also claimed the honour of his birth. the Egyptians seemed to think he proved [illegible] to them; but the most popular [illegible] which made him a native of [illegible] Cyclades, where his mother Leto, [illegible] jealous wrath of Juno over land and [illegible] found rest and shelter, and was delivered under the shadow of an olive-tree, at Mount Cynthus. To spite the Queen [illegible] who was far from being a favourite with the goddesses, these hastened to tender their aid to the weak and wearied Leto. The [illegible] much made of. Themis fed him with ambrosia, the food of the gods, which suddenly excited the conceit of [illegible] inasmuch as he surprised his nurse [illegible] feet, demanding a lyre, and announced of henceforth revealing to [illegible] The island, proud of having [illegible] the [illegible] A., adorned itself with a robe of golden [illegible]

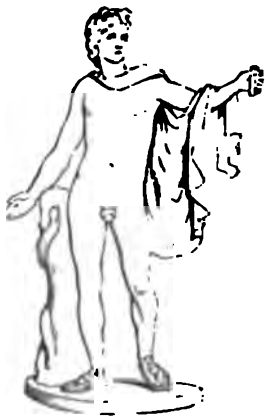
In ancient literature A. is described as [illegible] of many and various powers, all of which are seen on closer inspection to be in [illegible] to each other. He is spoken of [illegible] retributive justice, who, armed with bow [illegible] sends down his glittering [illegible] offenders. In this character [illegible]

of the *Iliad*. 2. As the instructor of bards, god of song or minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. 3. As the god of prophetic inspiration, especially in his oracle at Delphi. 4. As the guardian deity of herds and flocks. 5. As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (*Æsculapius*), the god of the healing art. 6. As a founder of cities. According to Homer, he assisted Neptune in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated A. as their founder. By the later

Apollo.

A was identified with Helios, the sun-god, mer describes the latter as a distinct deity. ..rtics, however, have regarded Helios, or the as the true original A.—an opinion which ported by many probabilities. The suppo- A. was identical with the Egyptian deity was rejected by the learned O. Müller, erally opposed all attempts to deduce from Egyptian mythology. According to 's theory, A. was a purely Doric deity, whose residence was in Tempe, and who afterwards ed to Delphi, whence the fame of his oracle was abroad, and made him to be recognised as the l divinity of Greece. The introduction of his Attica appears to have been contempo- with the immigration of the Ionians, and worship would seem to have spread over the ponnesus, immediately after it was conquered by Dorians. Much controversy has taken place, with reference to the idea which lies at not of the whole myth of the A. worship, also as to whether this myth had its origin north of Greece or in Egypt. Even on osition that the original conception was from the latter source, it was to Greek art osophy that it owed its development into the humanity. The most celebrated oracles of A. at Delphi, Abæ in Phocis, Ismenion in Thebes, Claros, near Colophon, and Patara in Lycia. mong the Romans, the worship of A. was prac- ed as early as 430 B.C., and prevailed especially der the emperors. But there can be no doubt that Romans derived their conceptions of A. entirely m the Greeks. It was in honour of A. and his ter Diana that the *ludi seculares* were cele- ted every hundred years. The attributes of A. the bow and quiver, the cithara and plectrum, snake, shepherd's crook, tripod, laurel, raven, ; less frequently, the grasshopper, cock, hawk, lf, and olive-tree. In sculpture, he is generally resented with a face beautifully oval, high fore- d, flowing hair, and slender figure.

APOLLO BELVEDERE, a celebrated statue of beauty, which has generally been regarded as bodying the highest ideal of manly beauty. It generally supposed to represent the 'lord of the erring bow' in the moment of his victory over Python. but numerous other explanations have ted. The figure (upwards of 7 feet in aked, but a cloak fastened round the gracefully over the extended left arm; n of the face is one of and h. ed with 'beaut slain.' in 1503, amid the ruins of the ancient Antium, now Capo d'Anzo, and purchased by Pope Julius II., who



Apollo Belvedere.

placed it in the Belvedere of the Vatican, whence the name it bears. The date of its execution is with probability referred to the reign of Nero, but the name of the artist is a matter of mere conjecture. The left hand and the right fore-arm, wanting in the statue as discovered, were restored by G. A. da Montorsoli, a pupil of Michael Angelo.

APOLLODO'RUS, an Athenian painter, who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved colouring and distribution of light and shade.—A., a celebrated architect in the time of the Emperor Trajan, by whom he was employed to construct a bridge over the Danube in Lower Hungary. His severe censure, boldly pronounced on a design for a temple of Venus, which the Emperor Hadrian had sent to him, caused A. to be sentenced to death in 129 A.D.—A., a Greek grammarian, lived about 140 B.C., studied philosophy in Athens, and grammar under Aristarchus; wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The mythology, which begins with the origin of the gods, probably went down as far as the Trojan cycle, but a portion of it has perished. It has been reckoned by some only an extract from a larger work by A., though this is a mere hypothesis, based on the fact that the legends are given with extreme simplicity and brevity. The work is one of great value to classical scholars. An edition of the *Bibliotheca* of A., in 4 vols., was published at Göttingen, 1782–1783, by C. H. G. Heyne.

APOLLO'NIUS, the name of several celebrated Greek grammarians and rhetoricians. A., surnamed Dyscolos (or ill-tempered), of Alexandria, lived in the 2d c. Some of his grammatical works were edited by Bekker. A. was the first who reduced grammar to a system. His reputation was so high, that Priscian calls him *grammaticorum princeps* (the prince of grammarians).—A., son of Archebulus, also of Alexandria, lived in the time of Augustus, and was the author of a lexicon of Homeric words.—A., surnamed Molon, was a teacher of rhetoric at Rhodes, and also gave lectures at Rome, where he was highly esteemed by Cicero and Cæsar.—A. OF PERGA, 240 B.C., is classed with Euclid, Archimedes, and Diophantus, as one of the founders of the mathematical sciences. His work on conic sections has been preserved,

partly in the original Greek, partly in an Arabic translation.—A. OF RHODES (or of Alexandria, say some authorities), born 235 B.C., wrote many works on grammar, and an epic poem, entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. It was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated, not only in a wholesale manner by Valerius Flaccus, but even by Virgil in some passages. It has been edited by the German scholars Brunck and Wellauer (Leipsic, 1813—1828).

APOLLO'NIUS, OF TYANA, in Cappadocia, who lived in the time of Christ, was a zealous follower of the doctrines of Pythagoras. He soon collected a considerable number of disciples, travelled through a great part of Asia Minor, and endeavoured to find his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reached the court of King Phraortes, in India, who recommended him to Jarchas, the principal Brahmin. When A. returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. From Rome he was expelled on a charge of having raised a young woman from the dead. After extensive travels in Spain, Italy, Greece, and Ethiopia, he was accused of having taken part in an insurrection against Domitian; but appeared before the tribunal, and was acquitted. Ultimately, he appears to have settled in Ephesus, where he opened a Pythagorean school, and continued his teaching until he died, nearly one hundred years old. His history was written about a hundred years after his death by Philostratus (q.v.). It contains a mass of absurdities and fables, through which an outline of historical facts and the real character of the man are sufficiently discernible. Hierocles, a heathen statesman and opponent of Christianity, wrote, in the 3d c., a work on the life and doctrines of A., with a view to prove their superiority to the doctrine of Christ. In modern times, the English freethinkers Blount and Lord Herbert, and Voltaire in France, have renewed the attempt.

APOLLO'NIUS, of TYRE, the hero of a Greek romance, which enjoyed great popularity in the middle ages, and was translated into almost all the languages of Western Europe. In it are related the romantic adventures which befell A., a Syrian prince, previous to his marriage with the daughter of King Alcistrates, of Cyrene. To these are added the adventures of his wife, who was parted from him by apparent death, as well as those of his daughter, Tarsia, who was carried off by pirates, and sold in Mitylene. The poem closes with the reunion of the whole family. The original Greek work no longer exists; but there are three very early Latin versions, of which one was published by Welser (Augsburg, 1595); another is to be found in the *Gesta Romanorum;* and the third in the *Pantheon* of Gottfried of Viterbo. From this Latin source have proceeded the Spanish version of the 13th c., printed in Sanchez' *Collection de Poesias Castellanas* (2d edition, Paris, 1842), several French versions, in prose and verse, as well as several Italian. As early as the 11th c. there was an Anglo-Saxon adaptation of the work, and subsequently various English ones appeared. Shakspeare has treated the subject in his drama of *Pericles;* he sub follows in his *Confessio Amantis,* w the *Pantheon* of Gottfried of Vi lar English stories, drawn fr of this romance, appeared in L and 1607; while the Dutch, in from the German. The romance German, probably from the *Gesta Ro* certain 'Heinrich von der Neuenstadt' (i.e. about the year 1300, in the form of a l yet, unpublished poem. Later, we *des Küniges Appolonii,* translated fi Viterbo, and first published at A Simrock, in his *Sources of Sha* the story as it is given in the *Gesta* modern Greek translation of the undertaken in 1500 by Gabriel Contianus, and several times reprinted at Venice, confounded with the lost Greek original.

A'POLOGUE, a fable, parable, or al intended to serve as a pleasant vehicle of a doctrine. One of the oldest and best an parables is that by Jotham, as given in Judges (ix. 7—15). Another celebrated the 'Limbs and the Body,' related by Menenius Agrippa. Æsop's fab world-wide reputation. Luther h of the value of the A. as a vehicle that he edited a revised Æsop, for which he characteristic preface. He says: 'In d have especially cared for young people may receive instruction in a style su age, which is naturally fond of all and I have wished to gratify this na out indulging anything that is bad.'

APO'LOGY. The term is now co stood as synonymous with an excu an engagement, &c., but was origin title of any work written in def doctrines, as in the *A. of Socrates,* Plato and Xenophon; the *A. for the* by Tertullian, and in many Christians, written by Justin Tatian, Theophilus, Origen. APOPLEXY is a term applied to an engorge- ...of blood, with or without extravasation, in or ...any organ, as the brain (*cerebral* A.), the *spinal* ... (*pulmonary* A.). As popularly used, the ... vaguely a condition arising from some ...ce within the head. A. occurs in *fits*, which ... ...den or come on by degrees. They are char- ...ised by loss of sense and motion, speechlessness ...heavy sleep, with stertorous respiration and a ...pulse. The fit may last from a few hours to ...r three days, and passes off, leaving generally ... or less paralysis, and recurs at intervals of ... or years. The *age* at which A. occurs most ...ally is from fifty to seventy, and is compara- ... before and after these ages. Cerebral A. ... from mere congestion of the blood-vessels ...rain, caused by impeded return of the venous ..., as from the military stock pressing on the ...ar veins, keeping the head long in one position, ...ining it quickly. Stout persons, with short ..., are more liable to this form of A.; though ... persons are also frequently its victims. But ...ddition to congestion, there may be an escape ...e watery portion of the blood from the con- ...d vessels, and this collecting, produces *serous* ..., owing to a diseased condition of the arterial ... the v...s may burst, and A. from cerebral ... the result; the latter is the most ..., ...d is usually preceded by some softening ...e brain substance itself. If this bleeding be ...y great extent, death results; if only a small ...tity escapes, it coagulates, and forms a clot, ...h is absorbed in time. Persons with diseased ... ...l lungs, and pregnant females, are liable to ... fits. The attack is generally preceded ...idache, partial or temporary loss of memory, and occasionally double vision. When these warnings occur, medical advice should be sought to correct the digestive functions; and by relieving the oppressed brain, ward off the fit. When the latter occurs, the patient's head should be raised, cold applied, and in some cases blood should be withdrawn from the temporal artery or external jugular vein. As soon as possible, purgative medicines should be administered. For the results of A., see PARALYSIS. Tumours within the skull produce symptoms of A.

APO'STATE literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to renegade, or one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on speculative grounds (the Emperor Julian, for instance). After the 5th c., when heathenism was declining, many who had no sincere belief in Christianity, yet made profession of it, and were baptised: these also were styled apostates. The apostates in times of persecution were styled variously Sacrificati, Thurificati, &c., according to the modes in which they publicly made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. The Roman Catholic Church at one period imposed severe penalties on apostasy. The apostate was of course excommunicated; but sometimes also his property was confiscated, and he himself banished, or even put to death. It has often been of great moment to the fortunes of a nation that a prince has apostatised. The most renowned instance in modern history, is that of Henry IV. of France. In 1833 there was published, at Erlangen, *A Gallery of Important Persons who in the 16th, 17th, and 18th Centuries went over from the Protestant to the Roman Catholic Church.*— The term APOSTASY is now employed commonly, and often abusively, as a reproach for great or sudden changes in political opinions.

APO'STLE (Gr. *apostolos*, sent forth, sent on a mission), any messenger whatever, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew (called also Nathaniel), Thomas, Matthew (surnamed Levi), James (the son of Alphæus), Thaddeus, Simon, and Judas Iscariot. Subsequently, Matthias was chosen in the room of Judas; and at a still later period, the number of the apostles was further increased by the calling of Paul to the apostleship. The term is sometimes used in the New Testament in its more general signification. Barnabas is styled an A. (Acts xiv.). It is a point of controversy between the supporters and opponents of episcopacy, whether or not the term A., as indicating an office, is applied to any except the original twelve, Matthias, and Paul; it being maintained, on the one hand, that the office is perpetuated in bishops; on the other, that it was temporary and belonged exclusively to those who were witnesses of the resurrection of Christ, and were employed by him to found the Christian Church. The apostles were twice commissioned by their Master to go forth on their work of evangelisation. First, during the third year of his public ministry. On this occasion, their labours were to be restricted to the Jews, properly so called. Not even the Samaritans, though natives of Palestine, were to be the objects of their religious solicitude. They were earnestly to seek out the lost sheep of the house of Israel. The second time was shortly before the Lord's ascension, when

their sphere of labour was indefinitely extended. 'Go, and teach all nations, baptising them in the name of the Father, and of the Son, and of the Holy Ghost.' On the day of Pentecost, the apostles received miraculous gifts fitting them for their arduous work. And after evangelising for some years in Palestine, they all departed, with the exception of St James, into various quarters of the globe; but the region of their ministry seems to have principally comprised the civilised provinces and cities of the eastern part of the Roman empire—viz., Syria, Asia Minor, and Greece; though probably Peter, and after him Paul, visited Rome. There is no historical foundation for the tradition that the first apostles divided the then known world into twelve parts, each taking one of these for his special sphere of labour. This figment was very likely originated by two circumstances: 1. That the disciples were commanded to go into all the world and preach the gospel; and 2. That the disciples in point of fact had little personal intercourse with each other. Their zeal for the propagation of Christianity left them no time to gratify their social inclinations. As a consequence, we have very imperfect accounts of their lives or manner of death.

The several apostles are usually represented in medieval pictures with special badges or attributes: St Peter, with the keys; St Paul, with a sword; St Andrew, with a cross; St James the Less, with a fuller's pole; St John, with a cup and a winged serpent flying out of it; St Bartholomew, with a knife; St Philip, with a long staff, whose upper end is formed into a cross; St Thomas, with a lance; St Matthew, with a hatchet; St Matthias, with a battle-axe; St James the Greater, with a pilgrim's staff and a gourd-bottle; St Simon, with a saw; and St Jude, with a club.

APO'STLES' CREED. See CREED.

APOSTO'LIC, or APOSTO'LICAL, the general term applied to everything derived directly from, or bearing the character of the apostles. Either case constitutes apostolicity. The Roman Catholic Church declares itself the A. Church; the papal chair the A. chair, on the ground of an unbroken series of Roman bishops, from the chief apostle, Peter. The Church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be A.; so likewise do the Protestant Episcopal churches in Scotland and the United States. Apostolic Tradition (see TRADITION) claims to have been handed down from the apostles. In the same special sense, the name of A. Council belongs to that conclave of the apostles at Jerusalem (Acts, xv.), about the year 51 or 52 A.D., occasioned by the disputes raised at Antioch by Judaising Christians as to the admission of uncircumcised Gentiles into the church. Certain congregations or churches, also, which were the special scenes of the labours of the apostles, bore for centuries the title of A. Churches, more especially those of Jerusalem, Antioch, Ephesus, Corinth, and Rome. But with the ever-increasing spiritual power of the Romish hierarchy, the name A. came to be more and more exclusively applied to Rome, and is retained by her, despite the energetic protests of the Protestant Churches. Hence the term Apostolic See, i.e., the see of Rome; Apostolic Blessing, the blessing of the pope as the successor of St Peter; Apostolic Vicar, the cardinal who represents the pope in extraordinary missions; Apostolic Chamber, a council intrusted with the care of the revenues of the see of Rome; Apostolic Months—January, March, May, July, September, November—the months in which the pope, according to the Vienna Concordat of 1448, took possession of the vacant benefices in Germany, &c. A papal brief or letter is styled A. in same sense.

APOSTOLIC CANONS AND CONSTITUTIONS, both ascribed by tradition to Clemens ...nus, are notes of ecclesiastical customs held to ...postolical, written in the form of apostolic ...cta. The *Constitutiones Apostolicæ*, consisting ... t books, were probably composed in Syria, ...ntain, in the first six books, a comprehensive ... for the whole of Christian life. These were ...bably written about the end of the 3d c.; while ...seventh book, which is essentially an abridg... of them, may have belonged to the beginning ... 4th c. The eighth book was put together in ...dle of the 4th c., for the use of the priests, ...y relates to the sacred offices. Interpolations, ...ver, were afterwards introduced. The *Canones ...stolici*, which were also recognised by the church, ... composed at a later period. The first fifty, ...uded in the middle of the 5th c., and translated ... Greek into Latin by Dionysius the Younger, ...acknowledged by the Latin Church alone. The ... Church, on the other hand, accepted the ...-five canons put forth in the beginning of the ...; and this became a point of discord between ...hurches. Both collections were probably looked ... at first as apostolic traditions merely. Later, it ... to be believed that they were written down by ...apostles themselves, it being thought probable ... they should have expressed themselves posi... about the constitution as well as the dogmas ... church.

APOSTOLIC PARTY, the name given to a party ... acted a conspicuous part in the modern history ...ain. They were composed of fanatical Catholics, ... were also absolutists so far as the king con... to be their instrument. They formed them... (soon after the revolution of 1819) into an ...., whose leaders were fugitive priests, and whose troops were smugglers and robbers. After taking an active part in all the subsequent agitations, they finally merged (1830) in the Carlist party.

APOSTOLICAL SUCCESSION is a phrase used to denote one or both of *two* things – the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The former is necessarily a matter of fact, to be ascertained by history; the latter is rather a matter of opinion – the Roman and Protestant Churches, and again individuals and parties in either, differing widely from each other in their views. See BISHOP and ORDINATION.

APOSTROPHE (Gr. *apostrophē*, a turning away, or breaking off) is a rhetorical figure by which a speaker changes the course of his speech, and addresses, with greater or lesser emotional emphasis, persons present or absent, the dead, or inanimate objects, either to invoke them as witnesses, or to pity, praise, or blame them. When the figure is well managed, it has a thrilling effect, both in oratory and poetry; but when extravagantly introduced, it becomes ludicrous. Examples of it abound in the writings and speeches of the great poets and statesmen both of ancient and modern times. – A. in grammar, is the omission of a letter or letters in a word, the omission being marked by a comma, as *'tis* for *it is*; the comma so employed is also called an *A.*

APOTHECARY, the name formerly given in England and Ireland to members of an inferior branch of the medical profession. The A. was in England a licentiate of the Apothecaries' Society of London; in Ireland, a licentiate of the Apothecaries' Hall of Ireland. Up to a comparatively recent period, however, no inconsiderable proportion of those who practised as apothecaries, at anyrate in England, were persons practising without any licence. The A. frequently kept a shop in which he sold drugs and made up medical prescriptions, in this respect competing with the chemist and druggist. But he was entitled to attend sick persons, and prescribe for them; and though it was the almost universal practice of apothecaries to charge their patients only for medicines supplied, they had the choice between doing this and charging for their attendances. They could not charge for both. This was held by Chief-justice Best, in an action by an A., who sought to recover on both grounds (see Wilcock, *On the Medical Profession*).

In having this choice as to their mode of charging, they had the advantage of the chemists and druggists; but the chief advantage they had over these lay in the recognition, by the law, of their right to practise, and their consequent immunity from punishment for the results of malpractice, except where they had shewn gross ignorance. The Medical Act of 1858, which greatly altered the conditions of medical practice throughout the United Kingdom, has much improved the status of licentiates of the Apothecaries' Societies; and though such licentiates are still entitled to keep shops for the sale of drugs, and to make up their own prescriptions, the passing of the Pharmacy Act (1868) has made broader the distinction between them and the class of chemists and druggists (see CHEMISTS AND DRUGGISTS). The term A. has been long in disuse, though, no doubt, it is still a legal description for licentiates of the Apothecaries' Society of London, or of the Apothecaries' Hall of Ireland; and such licentiates are now, as licentiates in medicine before the law, in all respects, including eligibility for public appointments, on a par with the graduates of universities. Under the Medical Act of 1858, they are entitled to be registered as licentiates in medicine, and, when registered, they have the right of practising medicine in all parts of the Queen's dominions, charging both for their visits and professional advice, and for medicines or medical appliances supplied by them. It is possible, indeed, that they have one advantage over medical men practising on other qualifications; for it has been repeatedly held by county court judges in England that they are the only medical practitioners entitled to recover the price of medicines supplied to patients. But this question has never been brought before the superior courts in England, and the decisions referred to seem not to be supported by the language of the Medical Act. The conditions of getting the licences of the Apothecaries' Society and of the Apothecaries' Hall in Ireland are nearly the same as those imposed by other corporations which grant medical qualifications, the only difference worth mentioning being, that an apprenticeship to a licentiate for five years in England, for three years in Ireland, is indispensable for the apothecaries' license. The requirement of an apprenticeship puts the Apothecaries' Society and the Apothecaries' Hall of Ireland at a disadvantage compared with the Colleges of Physicians which grant licenses to practise medicine; it also makes it impossible for them to combine with surgical corporations in giving the double qualification in medicine and surgery on the result of a conjoint examination. Accordingly, a bill is now (1874) being promoted in parliament to make the requirement of apprenticeship unnecessary. The Apothecaries' Society of London and the Apothe-

caries' Hall of Ireland each appoint a member of the General Council of Medical Education and Registration. The former is the only licensing corporation in the United Kingdom which has ever granted a license to a woman to practise medicine; but by an alteration in the by-laws of the society, the licensing of women has been made practically impossible.

In England, the business or profession of an A., although not regulated, nor, indeed, fully recognised, till modern times, was the subject of several ancient statutes, and is traceable to a remote period. Richard Fitznigel, who died Bishop of London, is stated to have been A. to Henry II.; and it is an accredited tradition, that in 1345 King Edward III. gave a pension of sixpence a day to Coursus de Gangland, an A. in London, for taking care of, and attending his majesty during his illness in Scotland. It is, however, improbable that apothecaries were then common; indeed, it may be doubted whether at that time they existed as a publicly known body at all, for, in 1511, there was passed an act of parliament, the 3 Henry VIII. c. 11, for regulating the admission of persons practising physic or surgery, which makes no mention of the class now known as apothecaries. In 1543, however, the parliament passed a very curious act, the 34 and 35 Henry VIII. c. 8, the preamble of which deals severely with the ignorance and cupidity of the London surgeons; and which, as a remedy, provides for the toleration and protection of the irregular practitioners, who afterwards, as a body, acquired the distinctive name of apothecaries. This act, strange though it be in its language, may perhaps be regarded as the real foundation of the office of the A. It certainly shews on its face sufficient cause for its recognition of the persons to benefit whom it was passed, for it complains that the surgeons of London were not only unskilful and grasping, but that they 'have sued, troubled, and vexed divers honest persons, as well men as women, whom God had endued with the knowledge of the nature, kind, and operation of certain herbs, roots, and waters, and the using and ministering of them to such as had been pained with customable diseases, as women's breasts being sore, a pin and the web in the eye, uncomes of hands, burnings, scaldings, sore mouths, the stone, strangury, saucelim, and morphew, and such other like diseases; and yet the said persons have not taken anything for their pains or cunning, but have ministered the same to poor people only for neighbourhood and God's sake, and of pity and charity.' The act, therefore, proceeds to ordain, 'That at all time from henceforth it shall be lawful to every person being the king's subject, having knowledge and experience of the nature of herbs, roots, and waters, or of the operation of the same, by speculation or practice, within any part of the realm of England, or within any other the king's dominions, to practise, use, and minister in and to any outward sore, uncome, wound, apostemation, outward swelling or disease, any herb or herbs, ointments, baths, pultess, and emplaisters, according to their cunning, experience, and knowledge in any of the diseases, sores, and maladies beforesaid, and all other like to the same, or drinks for the stone, strangury, or agues, without suit, vexation, trouble, penalty, or loss of their goods, the foresaid statute in the foresaid third year of the king's most gracious reign, or any other act, ordinance, or statute to the contrary heretofore made in anywise notwithstanding.'

Anciently, the apothecaries were not distinguishable from the grocers (the surgeons being, in like manner, undistinguishable from the barbers); indeed, it rather appears that apothecaries and grocers were synonymous terms; and it was not 13th year of James I., that these b into two distinct corporations by king, which, reciting a previous grant in 1606, by which the two bodies united, declares that the apothecaries forward, be separate from, and constitute distinct from the grocers. The privil by this charter upon the apothecari wards considerably enlarged by an act ment, 55 Geo. III. c. 194, to which w refer. But even after the charter London apothecaries appear to merely as a trading company, ing the medicines which they sold, as it was thought, on the province until their right to do so was judgment of the House of Lords, i College of Physicians against Ro previous decision of the Court of Kin Rose, who was an A. and freeman had attended one Scale, a butcher. up and administered what was not proper medicine to him. This, it w on behalf of the physicians, was as their exclusive privileges, and th being of the same opinion, una ment for the plaintiffs; but reversed by the House of Lords. established had this branch of the pro sion become, that, in 1815, the act 55 Geo. III. c. 194, to which w referred, was passed to provide for th their education; thus, for the first ti be said, placing the apothecaries, as a footing of a liberal profession. This a completely regulates the position, privi sponsibilities of the apothecaries, after for the most part confirming) the charte I., by which the apothecaries of London b distinctively incorporated as a comp to enact that no person shall practise act as an assistant to an A., in any part or Wales, unless he shall have been e court of examiners (to be chosen by th wardens of the said company, in s act directs), and have received the of his being duly qualified to prac with respect to what constitutes such an A., it has been judicially determi of law will look to section 5 of t defines certain of the duties and lia office, but which in noway deprives a any of their previously acquired pri certificate—for which a sum is to be benefit of the company's funds— granted to any person below the one, or who has not served an five years to an A., and can pro of sufficient medical education and conduct; and any person practisi certificate, is disabled from recove and for every such offence is, more a penalty of £20, which can be rec county court. It is also provided as it is the duty of every A. to ness, such medicines that may the sick by any physician lawfully A. refusing to compound or sell, or pounding or selling any medicines any prescription or order, signed by lawfully licensed, with his initials, al penalties and forfeitures as therein further, that the master, wardens, apothecaries for the time be or them appointed, and being

, deification, or the raising of a of a god (Gr. *theo*). From the f view there is nothing monstrous he contrary, it is quite natural, t of the system. Among heathens generally, and especially among the Romans, every departed spirit became a deity (see MANES); 'and as it was common for children to worship (privately) the manes of their fathers, so was it natural for divine honours to be *publicly* paid to a deceased emperor, who was regarded as the parent of his country.' (See SMITH'S *Dictionary of Greek and Roman Antiquities.*) At the *Consecratio*, as it was called, of a Roman emperor, the body was burnt on a funeral pile, and as the fire ascended, an eagle was let loose to mount into the sky, carrying, as was believed, the soul of the emperor from earth to heaven. Many medals are found with the word *consecratio* surrounding an altar, with fire on it, and an eagle rising into the air.

APPALA'CHIANS, the general appellation of the great mountain-system—called also the Alleghanies – which stretches from the interior of Maine to the borders of Alabama, its distance from the sea gradually ranging between about 100 miles in the north, and about 300 in the south. Speaking generally, this chain may be regarded as the parent of the Atlantic rivers of the United States on the one side, and on the other of the southern tributaries of the St Lawrence, and of the eastern feeders of the Mississippi: it is not, however, the actual water-shed during its entire length, for it is crossed by the Connecticut, the Hudson, and the Delaware, just as the Himalayas are pierced by the Ganges, and the Andes by the Amazon. The chain, in fact, consists of several ranges generally parallel to each other, which, along with the intermediate valleys that occupy two-thirds of the breadth, form a belt 100 miles wide—its multiform character, however, developing itself only to the west and south of the Hudson. To take the chief ridges by name, and to begin from the north: the White Hills of New Hampshire present the loftiest elevations, Mooshillock and Washington being respectively 4636 and 6634 feet above the sea. Next in order, the Green Mountains, which, true to the name, almost cover Vermont, attain, in Killington Peak, a height of 3924 feet; then come the Highlands, on the east of the Hudson, so striking an object to the voyagers on its waters; immediately beyond that river, again, we find the Catskill Mountains, which, though of inconsiderable length, contain two eminences—Round Top and High Peak respectively of 3804 and 3718 feet; while, on a terrace of another member of the group, Mountain House, a favourite refuge from the heats of summer, is perched 2500 feet above the level of the Hudson. Proceeding onwards, the Kittatinnies extend from the north of New Jersey as far as Virginia; while nearer to the sea, the Blue Ridge, stretching from about the same parallel down to North Carolina, or rather to low it, is crowned, within the limits of Virginia, by the Peaks of Otter, at an altitude somewhat greater than that of any point between themselves and New Hampshire. Lastly, there lie, more to the westward, the Alleghanies proper in Pennsylvania and Virginia, and the Cumberland Mountains on the east border of Kentucky and Tennessee.

Of all these elevations not one at all approaches the limit of perpetual snow. Yet France, while struggling with England in North America, regarded the A. as a wall that was physically to exclude her rival from the basins of the St Lawrence and the Mississippi. Anglo-Saxon energy, however, has virtually levelled the supposed barrier from end to end. Through Maine, New Hampshire, and Vermont runs a railway from Portland to Canada; by canal or by railway, or even by both abreast, New York has reached the waters of the St Lawrence on at least four principal points between Montreal in the east, and Buffalo in the west; Pennsylvania has carried to

Pittsburg a railway of 248 miles from Harrisburg, and a canal of 312 miles from Columbia; while, with the necessary exception of little Delaware alone, the remaining states along the coast have each its iron-way through the A.

The chain abounds in coal and iron, those gifts of nature to industrious man, which in all ages have done so much for civilisation, and which, in our own age, have, with the aid of steam, more than doubled all that they had done before; and it is a curious instance of the adaptation of the two worlds to each other, that, while the Spaniard met, in the south, the gigantic counterparts of the central plateau of his own romantic land, the Englishman, in the north, stumbled, as it were, on those same elements of almost creative energy which, within two centuries, were to be so instrumental in placing the daughter next to the mother among the nations of the earth. As an evidence of the actual value of the coal and iron of the A., Pennsylvania—where, hitherto, they have been chiefly found—has since 1840 made more rapid strides in growth of population than any other state in the Union, till between 1860 and 1870, when Illinois increased somewhat more rapidly. Nor are iron and coal the only valuable products of the A. To say nothing of the valleys—many of them as fertile as they are lovely—which separate the parallel ranges from each other, the mountains themselves yield limestone, marble, slate, building-stone, copper, zinc, chrome, &c.

Geology.—During the Azoic and Palæozoic periods of the earth's geological history, the district now occupied by the A. was a level plain. These mountains date their origin from a period subsequent to the Carboniferous epoch. The Coal measures are the newest upturned beds associated with the Appalachian range; and as the stratified rocks, with few exceptions, are laid down horizontally, these strata must owe their inclined position to the dislocating agency which elevated the mountains; they, consequently, supply a date anterior to its activity. At the base of the A., on their eastern side, there are a series of red sandstone beds, unconformable to the upturned strata, and occupying the valleys in their original horizontality, thus evidently unaffected by the disrupting agency which must have been active prior to their deposition. These beds have been referred by geologists to different ages. That they are Old Red Sandstone, as conjectured by Maclure and others, is now universally denied. Hitchcock's supposition that they were Permian, is also considered as referring them to too remote a geological age. W. B. Rogers considered them first as members of the Triassic period; but has since, from evidence adduced from the contained organic remains, shewn reason for relating them to the beginning of the Jurassic period. We thus obtain two grand limiting dates—the Carboniferous and Jurassic periods—within which the A. must have been formed. There are grounds for being even more specific, and referring the period of the dislocating agency to that immediately subsequent to the Carboniferous, represented in the stratified rocks of other districts by the Permian series; for the older upturned rocks had not only been ruptured and plicated, but also denuded into the various shapes they now present, before the horizontal rocks were deposited.

The late Professor H. D. Rogers, after years of persevering and devoted study, enunciated a theory of mountain formation based on his examination of the A., which not only explains their structure, but admits of a more or less complete application to the mountain systems of the world. The many proposed theories of mountain elevation are based upon assumptions which, unfortunately, are not true; but that is an unimpos[illegible] t[illegible] of our speculating geo[illegible], [illegible] by the inventors of the [illegible] selves to be led captive by a p[illegible] instead of building their inductions [illegible] tions. Thus, to suppose that mountain[illegible] by a wedge-like intrusion of melted [illegible] to a fluid functions incompatible w[illegible] properties. So also the supposition [illegible] rocks were intruded as solid wed[illegible], [illegible] lifting the crust, is opposed to [illegible] fi[illegible] apparent abrasion, but gene[illegible]w [illegible]ces exists at the line of contact [illegible] fied rocks. Equally fatal obje[illegible] against the other theories. Pro[illegible] ing that the A. were formed of a[illegible] waves, and comparing this appe[illegible] elevated districts, especially in Be[illegible] enunciated a theory of their stru[illegible] following is a condensed view.

Disturbed strata have a wave-[illegible] their dip being in curved, and never [illegible] and in extensive areas the varying a[illegible] one or more wide regular curves. [illegible] are in the form of long parallel waves, [illegible]elism being in the line of the general [illegible] part of the mountain system to wh[illegible] th[illegible] When different grades of [illegible] length, height, and amplitud[illegible], [illegible] the same grade are parallel, w[illegible] grades are not necessarily so. [illegible] three different forms, which

Appalachian Range.

Symmetrical flexures (*a*), equally [illegible] slopes; *normal flexures* (*b*), hav[illegible] incurvation on the one side com[illegible] other; and *folded flexures* (*c*), a[illegible] doubling under of their more inc[illegible] among which the steepest slopes are g[illegible] to the same quarters. These three for[illegible] different gradations in the flexure. [illegible] their succession in disturbed r[illegible] the same as in the diagram— [illegible] from the most disturbed side, [illegible] waves to the normal ones, and [illegible] symmetrical; and in the [illegible] they recede from the folde[illegible] wider apart and flatter. [illegible] Professor Rogers advanced hi[illegible] of elevated regions in the fol[illegible] wave-like structure of undulate[illegible] crust, is attributed to an actual p[illegible] matter beneath the crust, prop[illegible] of great waves of translation fr[illegible] occasioned by the tension of el[illegible] forms of the waves, the close plic[illegible] and the permanent tracing of [illegible] ascribed to the combination of [illegible] tangential movement, acc[illegible] of igneous veins and dikes [illegible] by the bendings. This on[illegible] ducing an actual floating f[illegible] has been, it is conceived, of [illegible] sation which attends all g[illegible] present day.'

This theory having [illegible] of the phenomena of the [illegible] these mountains. They are

having a general direction similar to
of the Atlantic Ocean. The line of
urbance is on their eastern limits;
he folded flexures, with the inversion
sides, are chiefly confined to the great

nessee, and Alabama.
rn slope of the A., the coal, from its
e region of greatest disturbance, has
its volatile constituents, and is con-
uing anthracite (q. v.). In the troughs to the westward of the great Appalachian valley, where the forces that disturbed the crust were not so intense, the coal has not parted with such a large proportion of volatile matter, but still is so much altered as to be characterised as semi-anthracite. Both the anthracite and semi-anthracite are extensively mined for economical purposes, but their extent as well as their value is of little importance compared with the enormous Appalachian bituminous coal-field. From Northern Pennsylvania to middle Alabama, its length is about 875 miles, and its greatest breadth between Southern Pennsylvania and Northern Ohio is about 180 miles; it covers an area of about 56,000 square miles, and is almost the largest expanse of coal measures in the world. A single coal-seam in this field has been traced over an extent of country 225 miles long by 100 broad, shewing a superficial area of 14,000 square miles. The actual depth of workable seams in the deepest part of this basin is estimated at 40 feet; but when the amount of denudation of the upper measures over large districts is taken into account, the average depth of the entire field cannot be more than 25 feet. Taking this as the thickness, the amount of coal in this great coal-field would be 1,387,500,000,000 tons. When this is compared with the estimated quantity of coal in the British coal-fields, viz., 190,000,000,000 tons, some conception may be formed of the enormous extent of coal existing in this district of North America.

Metals.—Extensive beds of magnetic, hematitic, and fossiliferous iron ores occur in many of the formations of the A., from the lowest metamorphic gneiss to the highest coal-measures. Iron ore is extensively wrought in Pennsylvania and Ohio, large quantities of the anthracite being used in the smelting furnaces. Veins of lead occur in the Metamorphic rocks, rarely stretching up into the red slate. In the Palæozoic beds, veins of copper and nickel occur in sufficient quantity to be wrought.

APPALACHICO'LA, a river of the United States, rising in Georgia, and flowing through Florida into the Gulf of Mexico, or rather into a bay that bears its own name. Reckoning from its remotest sources, the head waters of the Chatahoochee, the A. is about 400 miles long, being navigable for boats throughout nearly its entire course. It is, however, only at the junction of the Chatahoochee with the Flint that the name of A. is applied to the stream; and up to this point, a stretch of about 70 miles, there is a sufficient depth of water for steam-navigation; while the tides also ascend for about two-thirds of the distance.—A. is also a seaport at the mouth of the stream above mentioned. Here is shipped the produce of the river-basin, consisting chiefly of large quantities of cotton.

APPA'RENT. This term is used to express a number of important distinctions, especially in astronomy. The *A. magnitude* of a heavenly body is the angle formed by two lines drawn from the ends of its diameter to the spectator's eye; this obviously depends upon the distance of the body, as well as upon its real magnitude. A planet seen from the surface of the earth seems lower than if seen from the centre of the earth—the former is its *A. altitude*, the latter its real. *A. noon* is when the sun is on the meridian; true or mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator. See EQUATION OF TIME. The daily and annual motions of the sun in the heavens are both *A. motions*, caused by two real motions of the earth.

APPARITIONS. The belief that the spirits of the departed are occasionally presented to the sight of the living, has existed in all ages and countries, and usually declines only when a people have

advanced considerably in the knowledge of physical conditions and laws. Not that A. then cease to be reported—for this is far from being the case—but that the more intelligent part of the community are then usually able to explain away the alleged occurrence in some way satisfactory to themselves, not involving the admission of a possible projection of a spirit upon the living sense.

Nothing is more certain than that there are conditions of the body when spectral appearances, such as occur to us in uneasy dreams, become sensible to the waking vision. One of these conditions is that of the patient under the disease of *delirium tremens*, who not only hears ideal enemies plotting against his life in adjacent rooms or behind hedges, but thinks he sees them preparing to do him mischief, and has been known to jump overboard of a vessel into the sea, in order to escape the apprehended danger. In such excitements it is, though arising from different causes, that an intending murderer thinks he hears the prince of fallen angels tempting him on to crime, or sees before him a 'dagger of the mind' wherewith to end the life of his victim. There are also instances of spectral illusions traceable to a simply disordered state of the digestive organs. M. Nicolai, an eminent bookseller in Berlin, fell, in the early part of the year 1791, into a depression of spirits, and in that condition neglected a course of periodical bleeding which he had been accustomed to observe. The consequence was his becoming liable for some months to seeing trains of phantasmata or spectral figures, which moved and acted before him, nay, even spoke to, and addressed him. He was fortunately able, not merely to coolly observe the phenomena, but to describe them in an ample paper which he presented to the Philosophical Society of Berlin. This case may be said to have formed the basis of a theory of A., advanced by Dr Ferrier, Dr Hibbert, and others, amounting merely to this, that they are all to be accounted for by peculiar conditions of the organism of the individual sensible of them.

There is certainly a large class of cases which fall readily under this explanation; but, if we are to accept the whole that have been, on more or less good authority, reported, it must be admitted that a theory of a more comprehensive nature is still required in order to satisfy the duly cautious inquirer.

Let us take, for instance, an apparition story which Dr Hibbert owns to be one of the best authenticated on record. It was thus written down in 1662 by the Bishop of Gloucester, from the recital of the young lady's father: 'Sir Charles Lee, by his first lady, had only one daughter, of which she died in childbirth; and when she was dead, her sister, the Lady Everard, desired to have the education of the child; and she was by her very well educated, till she was marriageable, and a match was concluded for her with Sir William Perkins, but was then prevented in an extraordinary manner. Upon a Thursday night, she thinking she saw a light in her chamber after she was in bed, knocked for her maid, who presently came to her, and she asked why she left a candle burning in her chamber. The maid said she left none, and there was none but what she had brought with her at that time. Then she said it was the fire; but that, her maid told her, was quite out; and she said she believed it was only a dream; whereupon she said it might be so, and composed herself again to sleep. But about two of the clock she was awakened again, and saw the apparition of a little woman between her curtain and her pillow, who told her she was her mother, that she was happy, and that by twelve of the clock that day she should be with her. Whereupon she knocked again for her maid, called for her clothes, and was dressed, went into her closet, and again till nine, and then brought out a letter, sealed, to her father: brought it to the Lady Everard, told her what had been desired that as soon as she was d sent to him. The lady thought fallen mad, and thereupon sent Chelmsford for a physician and came immediately; but the ph no indication of what the lady gi indisposition of her body; notwi would needs have her let blood, w accordingly. And when the young patiently let them do what they would she desired that the chaplain might be called prayers; and when prayers were ended, guitar and psalm-book, and sat down without arms, and played and and admirably, that her there, admired at it. A she rose and sate herself dow arms, and presently fetching a two, immediately expired, and as was much wondered at by the surgeon. She died at Waltham miles from Chelmsford, and the lett Sir Charles at his house in Warwic was so afflicted with the death of his he came not till she was buried; but wh he caused her to be taken up, and to b her mother at Edmonton, as she d letter.'

Dr Hibbert, in treating of this case, co the young lady was consumptive and and in this diseased frame of body b of an illusion; but these are a contrary to what the record bears, all, the singular circumstance to be a that the young lady's death occurred time predicted. To a similar purport the wife of Dr Donne, related by Donne left his wife pregn with Sir Robert Drury to arriving there, he stated to L the vision of his wife walking her hair hanging over her sh in her arms. So impressed w that they immediately sent to inquire regarding Mrs intelligence brought by the man been brought to bed of a dead chil husband thought he had seen her in case, too, if the requisite disordered Donne were granted, the coincidence event in its particulars, and in point remain unaccounted for by Dr Hibb

That there is an abundance of will not be disputed. In what regarding them is to move, if t Hibbert's theory be acknowled depend on the general tendency of science. If psychological repute, and the phenomena of were diligently examined, there a satisfactory theory of what are world was many years older.

of the judgment being called the plaintiff in error, instead of appellant, and his opponent, the defendant in error, instead of respondent. Formerly, the proceedings commenced by suing out a writ of error first to a court of intermediate A., once the Court of Exchequer Chamber, and afterwards by a further writ of error to the House of Lords. But by the common-law procedure act of 1852 (15 and 16 Vict. c. 76, s. 148), writs of error are abolished, and the mode of review regulated by legal forms which need not be here explained.

Error also lies to the Queen's Bench in criminal cases, when, *after judgment*, it is considered that the indictment is bad in substance, or that the judgment is erroneous, or in respect of any other substantial defect appearing on the face of the record. A court called the Court for Crown Cases Reserved, consisting of five judges, disposes of cases where the judge or court had some doubt at the trial as to a point of law. And there is also practically an appeal to a superior court from all magistrates' decisions on points of law.

As to redress by way of A. and error against the judgments in the courts of Ireland, the procedure is so similar to that hitherto employed with respect to the English courts, that we need not here enter into particulars on the subject. We may simply remark, generally, that the Irish Chancellor, sitting alone, does not appear to exercise any appellate control over courts inferior to his own, such as that possessed by the Chancellor in England; for, according to the Irish practice, the A., for instance, from the Master of the Rolls, and in the case of proceedings in bankruptcy, is not to the Chancellor himself alone, but to the Court of A. in Chancery, in which the Chancellor and a Lord Justice of A. are the appointed judges; and which Court of A. likewise reviews the Chancellor's own individual judgments. The judgments of this Court of A. itself, however, may afterwards be reviewed on A. by the House of Lords. In criminal procedure, the same act (11 and 12 Vict. c. 78) applies to Ireland as well as to England.

In the procedure of the Scotch courts, there are various appeals in the practice of the sheriff or county courts, and in the proceedings in bankruptcy; and the House of Lords reviews the judgments of the Court of Session, the supreme civil court of the country, and which tribunal, indeed, it may be said, supplies the House with a large portion of its judicial business. This circumstance has frequently been remarked on as proving a litigious disposition on the part of the Scotch; but perhaps the greater number of Scotch appeals over English and Irish may be more fairly said to be occasioned by a natural feeling on the part of litigants and lawyers in Scotland, that there is a better chance of a nice and critical examination of the judgments appealed against by such judges as preside in the House of Lords, whose legal and judicial minds have been formed under a different and larger system of jurisprudence than prevails in Scotland, than there would be to a tribunal composed entirely of Scotch lawyers. Indeed, although the judicial staff of the House of Lords are chiefly English lawyers, the system of A. to their lordships from the Scotch courts works extremely well, and gives entire satisfaction to the Scotch people. Some of the most valuable elucidations of the peculiar principles of Scotch law are to be found in the judgments in Scotch appeals by the chancellors and other law lords who, since the union with Scotland, have administered the jurisdiction of the House in the last resort, but who were never in a Scotch court, and, until called upon to discharge such responsible functions, had probably never opened a Scotch law-book. (The Scotch and Irish appeal cases are, like

the English, about to be transferred from the House of Lords to the new Court of Appeal.)

There is no A. to the House of Lords from Scotland in criminal cases, nor does the above-mentioned act—11 and 12 Vict. c. 78, creating a court of criminal A. for England and Ireland—extend to Scotland. But the High Court of Justiciary there, which is the supreme criminal tribunal, and is composed of seven judges of the Court of Session, presided over by the Lord Justice General, or Lord President, as he is otherwise called, reviews the procedure of all the criminal courts of the country (excepting where such jurisdiction is expressly excluded by statute); and it is believed that no inconvenience is experienced in consequence of there being no other or further A. from the sentences of these courts.

APPENZELL (from *Abbatis Cella*), a canton in the north-east of Switzerland. Area, 152 square miles. Pop. (1870) 60,635. It is divided into two districts—Innerrhoden and Ausserrhoden, the former of which is peopled by Protestants, the latter by Roman Catholics, and noted for its dense population. The surface is mountainous, especially in the south, where Mont Sentis attains an elevation of 8232 feet. The chief river is the Sittern, which flows through the centre of the canton. A. holds the 13th place in the Swiss confederacy, and furnishes 972 soldiers to the national army. The inhabitants are chiefly employed in agriculture, cattle-keeping, cotton manufactures, and embroidery. They are fond of dancing, music, and athletic exercises, and have the reputation of being first-rate marksmen.

Appenzell, the capital of the canton of the same name, is situated on the left bank of the Sittern, in lat. 47° 29′ N., and long. 9° 24′ E. Pop. 3686. The town is ill built, and has only a small trade in linens. The other towns are Trogen (with a pop. of 2912, and manufactures of linen and muslin), Herisau, &c.

APPERLEY, CHARLES JAMES, the 'Nimrod' of the *Quarterly Review*, is a writer who deserves mention, if not from the intrinsic importance of the subjects on which he exercised his pen, at least from the perfection he attained in the department to which he confined himself. He was the son of a Welsh country gentleman, and was born in Denbighshire in 1777. His education at Rugby stimulated his love of field-sports more than his love of the classics. At the age of 24, he married, and went to reside at Bilton Hall, in Warwickshire, where he devoted his energies as exclusively to the chase as the great Nimrod himself could have done. He hunted everywhere in Great Britain. In 1821, he began to contribute to the *Sporting Magazine*. His clever, gossiping articles were so much relished, that in two years that periodical doubled its circulation. The proprietor, Mr Pittman, was of course highly gratified. He remunerated Mr A. handsomely, kept a stud of hunters for him, and paid the expenses of his sporting tours; but 'Nimrod' seems to have been of rather expensive habits, and to have occasionally required an advance of money from his employer. When Mr Pittman died, his relatives entered into a lawsuit with the 'mighty hunter,' for the recovery of this money. Nimrod, however, prudently transferred himself to France, where he chiefly resided during the rest of his life. He died on the 19th of May 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827).

APPERT, BENJAMIN NICOLAS MARIE, a French philanthropist, was born in Paris, September 10, 1797. He began his course in 1816 by introducing into several schools a system of mutual instruction, and, in 1820, founded and conducted gratuitously a school for the prisoners at [illegible] pected of having aided the [illegible] he was himself confined in the [illegible] where he made good use of [illegible] becoming acquainted with the moral [illegible] circumstances of prisoners. After prosecuted his benevolent plans [illegible] and undertook a journey thro[illegible] France, in 1825, to inspect school[illegible] &c. The results were given [illegible] the July revolution, he [illegible] Philippe to superintend [illegible] relief of the [illegible] visited Be[illegible] Bavaria, and gave [illegible] the management [illegible] hospitals, [illegible] in several works. PLE (*Pyrus malus*. For the generic character, ...). This well-known fruit has been very ... ated, and by that means it has been very ... oved. It was extensively cultivated ..., by whom, probably, it was introduced ... Britain. The wild A., or CRAB-tree, ... of Britain, and very generally found in ... ate climates of the northern hemisphere, is a small and often somewhat stunted-looking tree, ... stere, uneatable fruit, yet it is the parent of almost all the varieties of apple so much prized ... dessert. The A.-tree, even in a cultivated ... seldom more than 30—40 feet high. It has a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced, 3—6 together, in sessile umbels, and are large, white, rose-coloured externally, and fragrant. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs, which spring from branchlets of two or more years growth, and continue to bear for a series of years. The fruit of the A. is, with regard to its structure, styled by botanists a *pome* (q. v.). The eatable part is what is botanically termed the *mesocarp* (see FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned at last by the dried 5-parted limb of the calyx; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as often to rattle when it is shaken.

The A. is now one of the most widely diffused of fruit-trees, and in the estimation of many, is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, &c., but there its fruit is as small and worthless as in high northern latitudes. The varieties in cultivation are extremely numerous. They have been classified with great care by recent German writers, by whom the classification and description of apples, pears, and similar fruits, has been treated as a sort of science, and dignified by the name of Pomology. Metzger, in his description of the pomaceous fruits of Southern Germany, describes 89 different kinds of A., all of which are constant, besides sub-varieties. New varieties are continually produced; and as they are chiefly preserved and propagated by grafting—although

Apple-blossom.

some of them also grow by layers and cuttings—the old ones gradually die out. The *costard*, from which dealers in apples received the name of costard-mongers, is no longer known. Many varieties are designated by the general names of *Pippins*, *Rennets*, *Codlins*, and *Calvilles*. Some kinds, not approved for the dessert, are in high esteem as baking-apples, and others still more acid or austere are preferred for the manufacture of CIDER (q. v.).

The A. is grown in Britain either as a standard,

an espalier, or a wall-tree, and is variously trained. It is usually grafted on A. or crab-stocks, but succeeds also on hawthorn-stocks, and is in this way sometimes introduced into hedges. A very dwarf variety, called the *Paradise A.*, is often used as a stock on which to graft in order to produce dwarf-trees; and trees thus dwarfed are often very productive when little larger than currant or gooseberry bushes. Some of the varieties of A. are more hardy than others, and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others, both in flowering and ripening.

The wood of the A.-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit-tree, the A. requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, &c., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *Malic Acid*, which is extracted for medicinal purposes.—The fermented juice of the Crab A. is called *Verjuice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. Apples are an important article of commerce. Great quantities are imported into Britain, chiefly from France, Canada, and the northern parts of the United States. The A. *keeps* better than most kinds of fruit.

Beaufins or *Biffins* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat. They are prepared in great quantities in Norfolk.

The SIBERIAN CRAB is perhaps the parent, by hybridisation or otherwise, of some of the varieties of A. now in cultivation. Two species partake this designation, both natives of Siberia, and frequent in gardens in Britain, *Pyrus baccata* of Linnæus, and *Pyrus prunifolia* of Willdenow, which, however, scarcely differ, except that in the former the sepals (leaves of the calyx) are deciduous, in the latter they are persistent—a circumstance of very doubtful importance as a specific distinction. The fruit is sub-globose, yellowish, and rather austere, but is good for baking and for preserves.

The AMERICAN CRAB or SWEET-SCENTED CRAB (*P. coronaria*) is a native of North America, especially of the southern part of the Alleghanies. It is a small tree with broad leaves and white flowers, becoming purple before they drop off, and which have a powerful smell, resembling that of violets. The fruit is flatly orbicular, of a deep green colour, and sweet scented. It is very acid, but is made into cider, and also into preserves. *P. angustifolia*, a native of Carolina, much resembles this, but has much narrower leaves and smaller fruit.

The CHINESE CRAB (*P. spectabilis*) is a small tree, a native of China. It is very ornamental when in flower; the flowers being in sessile, many-flowered umbels, and of a bright rose-colour. The fruit is irregularly round, about the size of a cherry, yellow, and fit to be eaten, like the medlar, only when in a state of incipient decay.

A'PPLE OF SODOM. See SOLANUM.

A'PPLEBERRY. See BILLARDIERA.

A'PPLEBY, the county town of Westmoreland, lies in lat. 54° 35' N., long. 2° 28' W. It is in the north of the county, on the river Eden, which flows past Carlisle into the Solway Firth. A. has two parishes, one on each side of the river, which is here crossed by an old stone bridge of two arches. There is a castle in the town, the keep of which, Cæsar's Tower, is still in tolerable [illegible] Lent and summer assizes are held [illegible] passing of the Reform Bill, it returned [illegible] parliament. APPOI'NTMENT. In the law of [illegible] are frequently reserved in common law [illegible] granted on a consideration, and in ments, certain *powers*, as they powers of jointuring, selling, c[illegible] payment of money; and the [illegible] the power is called an *A.* This A.—[illegible] made either by deed or by will—is not an independent conveyance, but is mer to the deed or instrument in which the is reserved, and from which the party favour the A. is made for most purposes title. The Courts of Equity give relief defective A., or defective execution of a po there is what is called a 'meritorious cons in the person applying for such relief. A amounts to such meritorious c[illegible] St Leonards, in his work on Powe[illegible] Equity will relieve the following purchaser, including in such term a lessee; 2. A creditor; 3. A wife; [illegible] child; and 5. A charity. But in the defective A. by a wife in favour of there is no relief in Equity; nor is extended to a natural child; nor to a nor to a father or mother, or brother of the whole blood, much less of the h to a nephew or cousin. Against the quences of an A., the Courts of Equity

In the Scotch law, the expressions and *faculty to burden* correspond to phrase 'power of A.;' and the deed subsequently executed in virtue of power, is simply described accordi[illegible] and quality of the conveyance [illegible] term *A.* is not a technical word

)INTMENTS. The 'A.' of a ship are, ɔly, all her various articles of equipment and . In like manner, the 'A.' of a soldier, ɣ a trooper, comprise many miscellaneous ɔs which can come collectively under no but which, in part, will be found noticed headings. See EQUIPMENT, KIT, KNAP-

ʏRTIONMENT is a legal term derived ɔ 4 and 5 Will. IV. c. 22, called the ɯment Act, which has given rise to much ı in England and Scotland, and the prin- which may be stated to be this—that in the the termination of a life-interest by death, re limited interest at a fixed period, the ɾent or income shall be apportioned or paid such a way as to give the personal repre- ɑ of the party, or the party himself, as the ' be, a sum corresponding to the period that ɔ elapsed between the last date of payment death or other determination of the interest . But the act has no application to annual ɾable by any policy of assurance, nor to any hich a stipulation has been made that no take place.

ıct was not understood to apply to Scot- the year 1844, when it was decided by of Session that it did so apply, and the afterwards affirmed by the House of in consequence of the act being ex- ɾnuvely in the technical phraseology of ʊs England, it has given much trouble. ıter act of 33 and 34 Vict. c. 35, extends the to all rents, annuities, salaries, pensions, ɔ, and other periodical payments, in the f income, so that all these now, like interest y lent, are considered as accruing from day When a person therefore dies, the income d up to the day of death, and is payable at ɔ time as the next quarterly or other pay- uld be if no death had happened.

glish law, A. also takes place where the under a lease, has been deprived of part nd out of which the rent issues, by a person ı better title than that of the lessor, or ɯ, or where part of the rent has been red by the tenant to the lessor, or where r has disposed of the reversion as to part. ro the tenant has been wrongfully deprived ɔt of the landlord himself, even of a part of ɯs, there can be no A., but the whole rent ended so long as such a state of things

ɔ obtains in the case of a conveyance of ı ch the common of pasture is an appurte- party getting the land being entitled to ɯonate use of the common.

)SITION, a term in Grammar signifying the ɔf one substantive to another, in the same ɯation, in order to explain or limit the first; *brother, the physician; Thomas the Rhymer.* ɯntences or clauses admit of A.: thus, ɔn sought the way to India through Russia, of genius.' Sometimes a connecting word where logical propriety would require A.; *ty of London, for the city London.*

ıI'NERS AND APPRAISEMENT. An r ɯs a person employed to value property, ɯt be licensed for the office. Formerly, ɯ 55 Geo. III. c. 184, this annual license ɣ 10s.; but by the 8 and 9 Vict. c. 76, s. 1, resemble that it is expedient to increase this ɔ provision of the 55 Geo. III. is repealed, uty of £2 substituted for the 10s. Such a must now be taken out yearly by every person, except a licensed auctioneer, who shall exercise the occupation of an appraiser, or who, for any gain, fee, or reward, shall make any appraise- ment or valuation chargeable by law with any stamp-duty (see Tilsley on the Stamp-laws, 2d ed., p. 65).

By an old English statute, passed in the reign of Edward I., appraisers are enjoined to put a reason- able price upon goods; and if they appraise them too high, they are obliged to take them at their own valuation, and to be answerable accordingly to the creditor for his debt.

Appraisement, generally, is the act of valuation made by the appraiser; but in legal application in England, this term is used to signify a valuation of goods taken under a distress for rent by two appraisers, who are sworn by the sheriff, under- sheriff, or constable, to value the goods truly, accord- ing to the best of their skill; and after such appraisement, the goods may be sold at the best price that can be procured.

The duties chargeable on appraisements are as follow: Where the amount of such appraisement or valuation shall not exceed £50, the duty to be 2s. 6d.; and where it shall exceed

£50,	and not exceed	£100,	£0	5	0
100,	.	200,	0	10	0
200,	.	500,	0	15	0
500,			1	0	0

The exemptions from such duties are appraisements or valuations made in pursuance of the order of any Court of Admiralty or Vice-admiralty, or of any Court of Appeal from any sentence, adjudication, or judg- ment of any Court of Admiralty or Vice-admiralty; and appraisements or valuations of any property made for the purpose of ascertaining the legacy- duty payable in respect thereof.

The correspondingproceeding in Scotland is known under the term *appreciation*, which has been defined as the valuing of *poindel* or distrained goods. And by the old Scotch law, these goods were valued twice by different valuators—once in the house or on the ground where the poinding took place, and a second time at the market-cross of the local jurisdiction or chief county town. But by the 54 Geo. III. c. 137, s. 4, one valuation in the place where the goods are, is declared in every case to be sufficient.

APPREHE'ND. To A., in criminal law, means to arrest or seize, in virtue of a warrant or other legal authority, an offender taken in the act, or who is suspected. Arrest or apprehension by officers *without warrant* may be executed by the following persons: 1. By a justice of the peace, who may himself A., or cause to be apprehended, by word only, any person committing a felony or breach of the peace in his presence; 2. The sheriff; 3. The coroner; 4. The constable; 5. By the Larceny Act (24 and 25 Vict. c. 96), and by the 24 and 25 Vict. c. 97, called the Malicious Injuries Act, a person committing any offence under the same, except that of angling in the daytime, may immediately be apprehended without written warrant. Watchmen —either those appointed by the statute of Win- chester (13 Edw. I. c. 4), to keep watch and ward on all towns from sunsetting to sunrising, or such as were mere assistants to the constable, might, in virtue of their office, arrest all offenders, and par- ticularly night-walkers, and commit them to custody till the morning; but not so now.

Any private person, and, *a fortiori*, a peace-officer, that is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he is negligently permitted to escape; and by 24 and 25 Vict. c. 95, they may apprehend any person found committing any offence

against the provisions of that statute, or any indictable offence by night; that is, between nine in the evening and six in the morning of the next day. They may also, in the case of a person committing a felony in their presence, justify breaking open doors in pursuit of him. Upon probable suspicion, however, no one, being a private person, may arrest the felon or other person so suspected. And there is this distinction between the case of a peace-officer and that of a private person—that the former is protected, though it should turn out that no such crime as supposed has been in fact committed by any one, providing he had reasonable ground for suspecting the party arrested; but the latter acts more at his peril, and is not protected unless he can prove an actual commission of the crime by *some one*, as well as a reasonable ground for arresting the particular person. It is also to be observed that a private person cannot, on mere suspicion, justify, breaking open doors, which a constable, though acting without a warrant, sometimes may do. Within the metropolitan police district, a constable may take into custody, without warrant, all persons whom he may find, between sunset and the hour of eight in the morning, loitering or lying about, and unable to give a satisfactory account of themselves; or persons charged with aggravated assaults; or persons offending against the metropolitan police acts, whose address cannot be ascertained. See 2 and 3 Vict. c. 47, ss. 36, 64, 65.

The Scotch law, with regard to the apprehension of criminals, is substantially the same as the English.

By the statutes passed in 45 Geo. III. c. 92, and the 11 and 12 Vict. c. 42, facilities are afforded for the apprehension of criminals in England, Ireland, or Scotland, under warrants issuing from the respective authorities of the three countries, no further formality being necessary in the case of English and Irish warrants to be executed in Scotland, and *vice versâ*, than that they should be endorsed by a judge of the territory where they are to be enforced. And by the 6 and 7 Vict. c. 34, provisions are made for the apprehension, in the United Kingdom of Great Britain and Ireland, of persons committing treason and felony in Her Majesty's dominions out of the United Kingdom, and *vice versâ*, for the apprehension in such dominions of persons offending in England, Ireland, or Scotland. By section 3, offenders may be committed to gaol until they can be sent back to the place where the offence was committed; and information of the committal, in writing, under the hand of the committing magistrate, accompanied by a copy of the warrant, is directed to be given, in Great Britain, to one of Her Majesty's principal secretaries of state, and in Ireland, to the chief secretary of the lord-lieutenant; and in any other part of Her Majesty's dominions, to the governor or acting governor. By section 10, the important enactment is made, that it shall not be lawful to endorse any warrant for the apprehension of an offender under the act, unless it shall appear upon the face of such warrant itself, that the offence is such, that if committed within that part of Her Majesty's dominions where the warrant is endorsed, it would have amounted in law to treason, or some felony such as the justices of the peace in general or quarter sessions in England have not authority to try, under the existing acts—by which the jurisdiction of general and quarter sessions is defined—or unless the depositions taken appear sufficient to warrant committal for trial. The effect of this enactment is, that the offences for which criminals may be apprehended, under the 6 and 7 Vict. c. 34, are as follow: Any treason, murder, or capital felony; or any felony which, when committed by a person not previously convicted of felony, is [illegible] transportation for life, or for any of offences:

1. Misprision of treason. 2. Offences [illegible] Queen's title, prerogative, person, or go[illegible] against either house of parliament. 3. [illegible] ject to the penalties of præmunire. 4. [illegible] and offences against religion. 5. Adm[illegible] taking unlawful oaths. 6. Perjury [illegible] of perjury. 7. Making or suborn[illegible] son to make a false oath, affir[illegible] punishable as perjury or as [illegible] Forgery. 9. Unlawfully and [illegible] fire to crops of corn, grain, or p[illegible] of a wood, coppice, or plantation of [illegible] heath, gorse, furze, or fern. 10. E[illegible] against the laws relating to ma[illegible] tion of women and girls. 12. Er[illegible] ceal the birth of a child. 13. O[illegible] provision of the laws relati[illegible] insolvents. 14. Composing, [illegible] blasphemous, seditious, or d[illegible] Bribery. 16. Unlawful c[illegible] cies, except conspiracies [illegible] any offence which justices o[illegible] have or has jurisdiction to try when [illegible] one person. 17. Stealing, or fraudulen[illegible] injuring or destroying records or docum[illegible] ing to any court of law or equity, or relat[illegible] proceeding therein. 18. Stealing or fr[illegible] destroying or concealing wills or tes[illegible] papers, or any document or written i[illegible] being or containing evidence of the titl[illegible] real estate, or any interest in lands, [illegible] hereditaments.

In 1843, and next, in 1870, a [illegible] Vict. c. 52, was passed, by which [illegible] for carrying into effect a conventi[illegible] between the British and foreign gov[illegible] minable at pleasure), for the apprehe[illegible] ders in the two countries respectivel[illegible] *murder, forgery, robbery, rape, larc[illegible] obtaining money by false pretenc[illegible] bankruptcy crimes; frauds by bankers[illegible] tees, directors; abduction, child-steal[illegible] sinking and destroying vessels at se[illegible]* gets rid of the former practice of [illegible] rate act to regulate the extradition [illegible] between Great Britain and each co[illegible] all civilised countries have now en[illegible] kind of confederacy. There is an [illegible] in favour of fugitive criminals whos[illegible] demanded on the ground of offences [illegible] character; and the condition of [illegible] is, that, when taken back to [illegible] shall not be tried for political o[illegible]

The law encourages the apprehe[illegible] by parties who simply act from a [illegible] assist justice. By the 7 Geo. IV. [illegible] (amended and extended by the 14 [illegible] 55), it is provided that when [illegible] appear to any court of oyer [illegible] delivery, superior criminal c[illegible] tine, or any courts of s[illegible] been active in or towar[illegible] person charged with the vari[illegible] by these statutes, every such [illegible] order the sheriff of the cou[illegible] or persons who shall appe[illegible] been active in or towards the [illegible] person charged with any of [illegible] sum of money as to the [illegible] able and sufficient to co[illegible] persons for his, her, or th[illegible] loss of time, in or tow[illegible] this power is to be [illegible]

A., or on his behalf, to the master.
of the 5 Eliz. c. 4, which remained in
cent period, it was in general required,
rson exercising a trade in England
reviously served as A. to it for seven
by later statutes, that provision
, with a saving of the customs and
by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the municipal act, 5 and 6 Will. IV. c. 76, s. 14 (which does not, however, extend to London), all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices, were also done away. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding. To the same effect it is the rule of the Scotch law that although a pupil—that is, a boy under 14, or a girl under 12 years of age—may be a party to an indenture as an A., yet he must have the concurrence of a parent or guardian, who alone can be liable to the master for the A.'s non-performance of the engagement. An A., on the other hand, who has passed the years of pupilarity, may effectually enter into an indenture by which he will be personally bound. It has been decided in England that the express assent of an infant A. to the indentures is essential to the contract; and therefore indentures of apprenticeship which had been executed by a father and master, but not by the A. himself, were held invalid. But an infant may bind himself A., because it is for his benefit; for the same reason, however, he cannot himself dissolve the contract. When an A. is bound to two partners, on the death of one of them the apprenticeship is at an end.

There is a class who are bound out by the guardians of the poor, and are called *parish apprentices*, whose binding takes place under different circumstances. For the children of poor persons might formerly, even without becoming parties to the indentures, be apprenticed out by the overseers with the consent of two justices (and may now by the guardians, without such consent), till twenty-one years of age, to such persons as are thought fitting; and these persons were formerly also compellable to take them. But by 7 and 8 Vict. c. 101, s. 13, the reception of any poor child as an A. is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained; a subject which is besides now placed under the paramount control of the Local Government Board, who make new rules, from time to time, as they may think fit; and provisions are made by which the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shewn. Similar powers belong also to the justices, in the case of apprentices in general. (Stephen's *Commentaries*, vol. ii. p. 240, fourth edition.) It has been decided in England that a corporation cannot make a by-law limiting the number of apprentices which each member shall take, because such a regulation is deemed contrary to the laws of the land.

A mere agreement does not constitute an apprenticeship; there must be regular indentures formally executed. By statute 33 and 34 Vict. c. 97, indentures of apprenticeship in which the full sum or sums of money received, given, paid, secured, or contracted for, are not truly inserted, are void. But the act does not apply to cases where the sum is inserted in the indentures, though it is a less sum than that which was originally agreed for, and the reduction made to diminish the amount of the stamp-duty.

In the performance of the contract, a reasonable and equitable view is taken of the relative position of the parties. The master is not bound to the literal and uniform instruction of the A. by himself personally, but under his own superintendence, and by his own directions, he may avail himself of the

assistance of journeymen, or other persons serving in his place of business, and even of other apprentices —the object of the agreement being that the A. shall have the full benefit of all the master's arrangements in practising his art, craft, or trade. The A., on the other hand, although in the position of a servant to some extent, is not bound to serve as such, but may rather be said to be placed under the parental control of the master; and perhaps the master may correct the A.'s faults and disobedience by moderate chastisement, if the A. is still under age; nor can he discharge the A. To that end, the master, under an unrepealed enactment of the 5 Eliz. c. 4, must complain to the justices, who decide whether the A. has merited his dismissal or not; the A., however, having a corresponding privilege in the case of his complaint against his master. But, by the Scotch law, a master can dismiss his apprentice in the case of his proving 'incorrigible.' By the custom of the city of London, a freeman may turn away his apprentice for *gaming*.

It was decided by the House of Lords, on an appeal from Scotland in 1837, and reversing the decision of the Court of Session, that a barber's A., whose indentures bound him 'not to absent himself from his master's business, holiday or week-day, late hours or early, without leave first asked and obtained,' could not be lawfully required to attend his master's shop on Sunday mornings for the purpose of shaving customers, because such employment was a violation of the old Scotch statutes still in operation, and which were enacted for enforcing the observance of the Sunday, particularly one passed in 1559, by which it is provided 'that na handy lauboring or wirking be used on the Sonday.' The Lord Chancellor (Lord Cottenham) observed in his judgment that the English law on this subject was very similar, referring in particular to the 29 Charles II. c. 7, by which it is enacted 'that no tradesman, artificer, workman, labourer, or other person whatsoever shall do or exercise any worldly labour, business, or work, of their ordinary callings, upon the Lord's Day, or any part thereof, works of necessity and charity only excepted.'

An A.'s indenture is determinable by the consent of all the parties to it; and also by the death of the master. But the executor of the latter may bind the A. to another master if the contract so provide; and he must also discharge any covenant or agreement for the A.'s maintenance, so far as he has assets. By the custom of London, if the master of an A. die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the A. to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the A., who, if he has paid an A. fee to the bankrupt, is entitled to be paid by the court a reasonable sum out of the estate.

By the Mutiny Act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretences;* and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

There is some curious historical matter on this subject, relating for the most part to a state of the law now obsolete or repealed, for which see Knight's *Political Dictionary*, under this head.

APPRISING is the old technical term in the Scotch law, and now obsolete, for the process of adjudication. See ADJUDICATION.

APPROACHES, in military language, are the sunken trenches or excavated roads which are constructed by besiegers. The si

left in office found themselves
rtain of their difficulties, but as
that the King was strongly opposed
ion principle, and that there was no
louse of Lords assenting to it, they
as to find some means to delay com-
ces in the matter. A commission
appointed to collect information;
Lord Althorp met the Commons,
impressed on them how useless it was to discuss a mere abstract principle, and on Mr Ward's refusing to withdraw his motion, moved and carried the previous question by a large majority.

The short-lived ministry of 1835, under Sir Robert Peel, was in office when the appropriation question next came before parliament. The Liberals were in opposition; and Lord John Russell, who had succeeded to the Whig leadership in the Commons, on Lord Althorp's removal to the House of Lords, was now prepared to commit his party to the appropriation principle. When Sir Robert Peel brought forward a tithe commutation bill to supplement the bungled measure of 1833, Lord John Russell proposed two resolutions, which gave rise to one of the longest and most important of the numerous debates which have taken place on the question. On the one side, the chief speakers were Ward, Lord Howick, Sheil, and O'Connell; and on the other, Peel, Stanley, Sir James Graham, and Gladstone. Much of the interest which attended the discussion was caused by its involving the whole question of church establishments, and by a fear, on the part of the English Conservatives, that the doctrines of utility and expediency, so freely referred to in connection with the Church of Ireland, might one day be turned against the Church of England. On 2d April 1835, the House of Commons pronounced, by a majority of 33, 'that any surplus which might remain, after fully providing for the spiritual instruction of the members of the Established Church of Ireland, ought to be applied to the moral and religious education of all classes, without distinction of religious persuasion;' and a few days afterwards, a subsequent resolution was passed, 'That no settlement of the tithe question would be satisfactory unless it embodied the preceding principle.' In consequence of these resolutions, the Conservatives resigned, and the Liberals returned to power.

There was now in office a ministry pledged to the appropriation principle. In 1836, ministers brought forward a tithe commutation bill, containing clauses carrying out the principle fully and explicitly. The bill passed the Commons, but the A. C. were struck out by the Lords. The bill was thereupon abandoned. In 1837, a government tithe commutation bill again passed the Commons with A. C., and again these clauses were struck out by the Lords. On the motion of the ministers, the Commons rejected the amended bill. After the general election of 1837, the Melbourne ministry found themselves with a very narrow majority in the Commons. The liberal members had made the appropriation question a prominent topic at the election; but it was too apparent that England and Scotland were becoming weary of the interminable discussions upon Irish affairs. In the meantime, the state of Ireland was little better, and with an increasing party in the House of Commons to back them, there was no prospect of the Lords giving way upon the appropriation question. Still, it was necessary that something should be done, and the choice of the ministry lay between carrying a commutation bill without A. C., and resignation. The former course was chosen. The tithe measure was introduced, and ministers solaced themselves for their desertion of principle by the reflection, that after all there might be no surplus to appropriate, and that it would therefore be useless to prolong a collision with the Upper House on a matter of no practical importance. This conduct emboldened the opposition, and Sir Thomas Acland, on 14th May 1838, moved the recall of the celebrated resolutions of 1835. The discussion which followed was most damaging to the credit of the ministers, but they were saved, by a majority of 19, from the humilia-

tion of having the resolutions recalled. A last effort in support of the principle was made in July 1838, by Mr Ward, who then moved the insertion of A. C. into the government tithe bill. He was opposed by the whole ministerial force, and more strangely still, by the Irish members. O'Connell, who in 1835 had spoken of the one magical word 'appropriation,' which was to bring peace to Ireland, declared now that nothing would satisfy the Irish people except the total abolition of tithes. Thus deserted and opposed, Mr Ward's motion was lost by a large majority. The government tithe measure passed in August 1838, and tithes were commuted into a rent-charge of three-fourths of their amount. After that, they were collected with comparative facility, and the appropriation question, once the topic of discussion over the whole country, fell into oblivion, until the disendowment of the Episcopal Church in Ireland, in 1869, revived it in a new shape.

APPROVER, or **PROVER**, in the law of England, is a person who had been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. It had not so simple and intelligible a meaning in the ancient practice of the criminal law, in which *approvement* was a kind of confession of a complicated nature. Where a person in a prosecution for treason or felony confessed the fact before pleading to the indictment, and, at the same time, accused others, his accomplices, of the same crime, in order to obtain his pardon, he was called an *A.* or *P.* But, as the condition of the pardon he thus expected was the conviction of the accomplice he accused, if that failed, the A. received judgment of death upon his own confession. If, on the other hand, the accused accomplice was found guilty, the A. was entitled to his pardon *ex debito justitiæ*. But 'this course of admitting approvements,' says Blackstone, writing about a century ago, 'hath long been disused; for the truth was, as Sir Matthew Hale observes, that more mischief arose to good men by these kinds of approvements, upon false and malicious accusations of desperate villains, than benefit to the public by the discovery and conviction of real offenders; and, therefore, in the times when such appeals were most frequently admitted, great strictness and nicety were held therein; though, since their discontinuance, the doctrine of approvements is become a matter of more curiosity than use.'

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to become *Queen's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. The admission, however, of an accomplice to give evidence against his fellows, requires the previous sanction of the judges of jail delivery, and a motion is usually made at the trial to the judge for leave to admit the accomplice for that purpose. The testimony of an accomplice is in all cases, however, regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as Queen's evidence, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation, or fraud, he then forfeits all claim to protection, and may be tried, convicted, and punished on his own confession. Accordingly, upon a trial at York, towards the commencement of the present century, before the late Mr Justice Buller, the accomplice denied in his evidence all that he had before confessed, upon which the prisoner was acquitted. But the judge ordered an indictment to be preferred against the accomplice for the same his previous confession, and other was convicted and executed.

The term in the law of Sco of A. is *socius criminis*, and such socius is admitted. is left to the jury, are ' the criminal courts in ing and assuring safet English practice does. *Practice of the Crimin Law* p. 453, says: 'It has long been a principle in our law, that by the very a the *socius*, and putting him in the ba cutor debars himself from all title to m the future with relation to the matte is always explained to the witn judge as soon as he appears quently he gives his test absolute security as to upon himself. (1851). An English version of the
s published in London, 1853.

, Theodor Matvayevich, a distin-
n admiral, was born in 1671. When
rears of age, he entered the service of
t, who conceived a great attachment
lasted during the whole life of the
1699, he took part in the first
the Russian
naf. After the y

the most powerful and influential person at the court of the czar, who made him chief-admiral of the Russian navy, of which, in fact, A. may be considered the creator. While Peter was fighting the Swedes in the north, A. was building war-vessels, fortresses, and wharfs in the south. In 1707, he was appointed president of the Admiralty; in 1708, he defeated the Swedish general, Lübecker, in Ingermanland, and saved the newly-built city of Petersburg from destruction; in 1710, he captured the important town of Viborg, in Finland; and in 1711, commanded in the Black Sea during the Turkish war. The following year he returned to the north; and in 1713, with a fleet of 200 vessels, he sailed along the coast of Finland, took Helsingfors and Borgo, and defeated the Swedish fleet. The result of his great successes was, that at the peace of Nystadt, in 1721, Russia obtained some most valuable advantages, being confirmed in her possession of Finland, just conquered, and of Esthonia. In spite of his brilliant reputation, however, he twice suffered an apparent eclipse of imperial favour. In 1714—15 he was charged with embezzlement, tried, and condemned to pay a fine; and a few years later, was denounced by Peter himself as 'an oppressor of the people,' and again condemned to pay a fine; but his services were too useful to be dispensed with, and in both instances the czar neutralised the effect of the condemnation, by conferring upon him additional riches and dignities. In 1722, he accompanied Peter in his Persian war, and was present at the siege of Derbend. His last naval expedition was in 1726, when he repaired with the Russian fleet to Revel, to defend that place against an expected attack by the English. He died at Moscow, 10th November 1728, in the 57th year of his age.

A'PRICOT (*Prunus Armeniaca*), a species of the same genus with the Plum (q. v.), is a native of Armenia, and of the countries eastward to China and Japan; a middle-sized tree of 15–20, or even 30 feet high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun, with yellow flesh. The A. was brought into Europe in the time of Alexander the Great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th c. It is only in the south of England that it is ever trained as a standard, nor is it grown in the more northern parts, even as an espalier, but almost always as a wall-tree. More than twenty kinds are distinguished, amongst which some excel very much in size, fine colour, sweetness, and abundance of juice. The *Moorpark* is generally esteemed the finest variety, and the *Breda* as best suited for standards in the south of England, and in Scotland even for the wall, except in the most favourable situations.—The A. is generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are brought from Italy as an article of commerce, in particular from Trieste, Genoa, and Leghorn: in the south of France, also, they are an article of export in a preserved and candied state. Dried apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably re natural, and the sweetness, as in the almond, result of cultivation. Generally speaking, may be used for the same purposes as

almonds. From the bitter kernels, which contain Prussic acid, the *Eau de noyaux* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The BRIANÇON A. (*Prunus Brigantiaca*) very much resembles the common A. The fruit is glabrous. It is found in Dauphiné and Piedmont. At Briançon, an oil, called *Huile de marmotte*, is expressed from the seeds.

The SIBERIAN A. (*P. Sibirica*) is also very like the common A., but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria.

The A. PLUM is an excellent kind of plum, much cultivated in some parts of France, and which, preserved in sugar, dried, and packed in shallow boxes, forms a considerable article of trade.

A'PRIL. The Romans gave this month the name of *Aprilis*, from *aperire*, to open, because it was the season when the buds began to open; by the Anglo-Saxons it was called Ooster, or Easter-month; and by the Dutch Grass-month. The custom of sending one upon a bootless errand on the first day of this month, is perhaps a travesty of the sending hither and thither of the Saviour from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a miracle-play (q. v.) at Easter, which occurs in the month of A. It is possible, however, that it may be a relic of some old heathen festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. In France, one thus imposed upon is called *un poisson d'Avril* (an A. fish). In England, such a person is called an A. fool; in Scotland, a gowk. Gowk is the Scotch for the cuckoo, and also signifies a foolish person. The favourite jest in Britain is to send one upon an errand for something grossly nonsensical—as for pigeon's milk, or the History of Adam's Grandfather; or to make appointments which are not to be kept; or to call to a passer-by that his latchet is unloosed, or that there is a spot of mud upon his face. When he falls into the snare, the term A. fool or gowk is applied with a shout of laughter. It is curious that the Hindus practise precisely similar tricks on the 31st of March, when they hold what is called the Huli Festival.

A-PRIO'RI reasoning or demonstration is that which rests on general notions or ideas, and is independent of experience. Reasoning from experience is called *a-posteriori* reasoning. A predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato may be taken as typical of the A-P. school, Locke and Bacon of the other. A-P. speculation is more in accordance with the genius of the Germans than with that of the practical British. A-P. philosophy claims for its conclusions the character of necessary truths, and denies that there can be a-posteriori proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which A-P. reasoning rests, are themselves the results of experience, and that, therefore, all truth rests really on *a-posteriori* grounds.

A'PRON. This word is employed both in military and in shipping affairs. The A. of a cannon is a piece of sheet-lead which covers the touch-hole, tied by two pieces of white rope. In ship-building, the A. is a piece of curved timber fixed behind the lower part of the stem, and just above the foremost end of the keel; its ch

emu, and perhaps more nearly to the extinct dodo. It has a very long and slender bill, of which it

Apteryx Australis.

makes a remarkable use in supporting itself when it rests. It has three anterior toes, and a posterior one which is scarcely developed. The legs are of moderate length, the wings merely rudimentary. The feathers have no accessory plume. The diaphragm is more complete than in any other known bird. Only one species is known (*A. Australis*), about the size of a goose, a native of New Zealand. It is a nocturnal bird, and preys on snails, insects, &c. It is much prized for its feathers. The natives call it *kiri-kiri*, from its cry.

A'PTHÆ are small vesicles formed of the superficial layer of a mucous membrane, elevated by fluid secreted by the latter. They are usually whitish in colour, and the fluid may be serous or puriform. At the end of a few hours or days, the apthous vesicle bursts at its summit, and shrivels up, exposing an inflamed and painful patch of the mucous membrane. The most common site of A. is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin.

Infants are liable to an apthous eruption termed *thrush* (q. v.). A. in adults are generally the consequences of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of A., a preparation of borax, or some astringent wash, generally effects a rapid cure.

APU'LIA, a part of ancient Iapygia (so named after Iapyx, son of Daedalus), now includes the south-eastern part of Italy as far as the promontory of Leuca, and also the extreme peninsula of Calabria. Here, in ancient times, lived three distinct peoples—the Messapians or Salentini, the Peuceni, and the Daunı or Apulians. According to old Latin traditions, Daunus, king of the Apulians, when banished from Illyria, settled in these parts of Italy. Later traditions say that Diomedes, the Ætolian, with several other heroes returning from the Trojan war, came to Italy, and, in his war with the Messapians, was assisted by Daunus, but was afterwards deprived of his territory, and put to death. Roman poetry has preserved these old names; but in history no mention is made of any king of A., though we find the names of its principal cities—Arpi, Luceria, and Canusium. The second Punic war was for some time carried on in A. In the present day, A. (now styled PUGLIA) is merely the name of a geographical district, and has no political meaning. The whole territory, including the Neapolitan provinces, Capitanata, Terra di Bari, Terra d'Otranto, &c., is but a shadow of its former self, in the time of the Greek colonies, under Roman dominion, or even under the Normans, who took possession of it in 1043 A. D. The towns are depopulated, industry

has disappeared, and commerce, once so flourishing, has passed away. Agriculture is in a very low condition, and the few roads are infested by banditti. The people are generally ignorant and superstitious, but deserve praise for their hospitality to travellers.

APU'RE, a river of New Granada and Venezuela, which rises in the East Andes, near lat. 7° N., and long. 72° W. After receiving the Portuguesa and the Guarico from the north, it joins the Orinoco, in lat. 7° 40′ N., and long. 66° 45′ W. It waters the towns Nutrias and San Fernando.

APU'RIMAC, a river of Peru, which, after a course of 500 miles, assumes the name, first, of Tambo, and then of Ucayali, which again, after a course of 500 miles more, joins the Tangaragua to form the Amazon. The A. proper rises to the north-west of the great table-land of Lake Titicaca, receiving from it, however, no portion of its waters. Among the tributaries of the Amazon, it is one of the most southerly; while among them, it approaches perhaps the nearest to the Pacific. The A., from its source in lat. 16° S., drains the eastern face of the Andes through about 5°, till it changes its name, as above, in 10° 45′ S., meanwhile receiving several considerable affluents, more especially the Villcamayo, from the opposite quarter. The A. and its feeders partake of the nature rather of mountain torrents than of navigable rivers; and even for travelling by land, their rocky and rugged banks are always difficult, and often impracticable. The valleys vary in climate and productiveness according to their elevation. The upper ones yield wheat and barley, and most of the fruits of Europe; while the lower, or at least the lowest ones, abound in sugar and cotton, plantains and pine-apples. The basin of the A., as a whole, is said to be the finest part of Peru, and to contain the largest proportion of native population—the best specimens apparently of the aboriginal civilisation.

A'QUA FORTIS, literally, *strong water*, was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

A'QUA MARINE, a name sometimes popularly given to the Beryl (q. v.). Some green and blue varieties of topaz have also been styled A.

A'QUA REGI'NÆ, literally, *queen's water*, is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves much fumes, and may be used as a disinfectant, as similar mixtures are sold under the name of *everlasting disinfectants*.

A'QUA REGIS, or REGIA, literally, *royal water*, is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term aqua regia (royal water) was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

AQUA'RIUM, a tank or vessel containing either salt or fresh water, and in which either marine or fresh-water plants and animals are kept in a living state. The name was formerly sometimes given to a tank or cistern placed in a hot-house, and intended for the cultivation of aquatic plants. The A., as now in use—originally called *Vivarium* or *Aquarivarium*, and intended chiefly for animals, became extremely common about twenty years ago. From 1854 to 1860, there was a mania for these scientific toys: they became not only an aid to study, but a source of rational amusement, depending in principle upon the relations discovered by science between animal and vegetable life, and particularly upon the consumpt by plants, under the action of light, of the carbonic acid gas given forth by animals, and the consequent restoration to the air or water in which they live of the oxy[gen] maintenance of animal life. [A.] contain both plants and an[imals] like a proper proportion. Zoophytes, Annelusca, Crustacea, and fishes may thus, [with] be kept in health, and their habits o[bserved]. water must be frequently *aerated*, which accomplished by taking up portions of [water] and [pouring] them in again from a small height. [The] A. is frequently provided with a [fountain] produces a continual change of w[ater]. where this is the case, the presence [of] and animals is advantageous to the h[ealth]. spread out their delicate and finely tinted from the mouth of their shelly tube, and within it, quick as thought, upon the disturbance. Balani, or acorn-shells, are tiful objects when they are seen opening mit-valves, and rapidly stretching out and their little nets. Even periwinkles and e interesting, particularly when they are by the aid of a magnifying-glass, as they the spores of the confervæ which have n to vegetate on the glass of the A., owly along, with continual opening and of the mouth, like cows at pasture, when ure and motions of their mouths may be and the singular beauty and brilliancy of ever fails to command admiration. The good magnifying lens adds greatly to the the A., and zoophytes of exquisite forms s may be watched in the actual processes The feeding of fishes, crabs, sea-anemones, source of amusement, and it is interesting

uarium, with Fountain for Aerating.

te how the inmates of the A. occasionally eir fellow-prisoners.

a of the A. seems to have originated from l's invention of the *cases* which bear his WARDIAN CASES), and in which delicate other plants grow so well even in towns; te Sir John Graham Dalzell began to keep rine animals in his house in Edinburgh so '90, and continued to do so till the year 1850. ington appears to have been the first to eriments on its practicability, and the name se is intimately associated with its early ent and introduction to popularity as a plaything. A Mr Price also conducted successful experiments as to the balance and vegetable life in aquaria. The largest the world are those at Brighton and Hamthere is also one of large dimensions at the 'alace, Sydenham. In these the habits of r fishes may be studied with advantage.

'RIUS, *the Water-bearer*, the eleventh sign ac, through which the sun moves in part nths of January and February. It is also of a zodiacal constellation, whose position evens may be found by producing a line in y direction through the stars in the head neda and the wing of Pegasus.

AQUATIC plants and animals are those that live either wholly or partly in water. The term is very vaguely used, those plants being often called A. which grow in ponds, ditches, &c., although not only their inflorescence, but great part of their foliage, is above the surface of the water, as well as those which more completely belong to that element; and a similar latitude of meaning prevails with regard to animals. Few phanerogamous (or

Aquatic plant.

flowering) plants exist entirely under water, although there are a few, like the common *Zostera marina*, or Grass-wrack, which do so, and produce even their flowers in that condition; others, of which the greater part of the plant is usually under water, produce their flowers upon, or considerably above, its surface, as those of the genera *Valisneria*, *Anacharis* (q. v.), &c. The leaves, as well as the flowers, of many float upon the water, of which the water-lilies furnish well-known and beautiful examples; whilst in *Ranunculus aquatilis*, that exquisite ornament of our river margins, we have an instance of a kind not unfrequent, of great diversity between the lower leaves which remain submersed, and the upper leaves which float. Of cryptogamous plants, one great order, Algæ, is exclusively A., and these seem adapted to perform under water all the functions of their life. A. plants are, in general, of less compact structure than is usual in other plants, and are thus lighter and better adapted for rising in their growth towards the surface of the water; in order to which also some of the algæ, as may be seen in more than one of the most common sea-weeds of our coasts, are provided with air bladders of considerable magnitude. All this is the more necessary, as plants completely A. have generally little firmness of stem, and if their weight made them fall to the bottom, would lie in a mass, as they do when withdrawn from the water, in which, however, they gracefully float, their flexibility of stem enabling them to adapt themselves to waves or currents which would destroy them if they were more rigid. So admirably are all things in nature harmonised.

Many animals, to a considerable extent A. in their habits, must not only breathe air, but are adapted for spending great part of their existence on dry land. Such are chiefly those that seek their food in the water. The peculiarities of structure by which they are fitted for wading, for swimming, for diving, and for remaining under water a longer time than other animals can, are very interesting and admirable. Even the fur of the beaver, the otter, the water-rat, and other animals of this description, is not liable to be drenched like that of other quadrupeds; and the plumage of waterfowls exhibits a similar peculiarity. The feet of many are webbed, so as to enable them to swim with great facility; and to this the general form, as in water-fowls, likewise exhibits a beautiful adaptation. The webbed feet in some, of which the habits are most thoroughly A., as seals, assume the character

of a sort of paddle, admirably fitted for use in the water, but by means of which they can only move very awkwardly on land. The forms of whales and fishes are remarkably adapted for progression in water; whilst, instead of the limbs by which other vertebrate animals are enabled to move upon the land or to fly in the air, their great organ of locomotion is the tail, or rather the hinder part of the elongated body itself, with the tail as the blade of the great oar, which all the principal muscles of the body concur to move. Remarkable provision is made in A. animals of the higher vertebrate classes for the maintenance of the requisite animal heat, by the character of the fur or plumage; a purpose which the blubber of whales also most perfectly serves. In the colder-blooded animals, where no such provision is requisite, the structure of the heart is accommodated to the diminished necessity for oxygenation of the blood; and although reptiles in their perfect state must breathe air, most of them can remain long under water without inconvenience. Fishes, and the many other animals provided with branchiæ or gills, breathe in the water itself, deriving the necessary oxygen, which in their case is comparatively little, from the small particles of air with which it is mingled. They cannot subsist in water which has been deprived of air by boiling. Some A. insects carry down with them into the water particles of air entangled in hairs with which their bodies are abundantly furnished.

AQUATI'NTA, a mode of etching on copper, by which imitations of drawings in Indian ink, bister, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. The process of A. has fallen into comparative disuse.

A'QUA TOFA'NA, a poisonous liquid which was much talked of in the south of Italy about the end of the 17th c. Its invention is still a matter of dubiety, but is ascribed to a Sicilian woman named Tofana, who lived first at Palermo, but was obliged, from the attention of the authorities having been attracted to her proceedings, to take refuge in Naples. She sold the preparation in small phials, inscribed 'Manna of St Nicholas of Bari,' there being a current superstition that from the tomb of that saint there flowed an oil of miraculous efficacy in many diseases. The poison was especially sought after by young wives that wished to get rid of their husbands. The number of husbands dying suddenly in Rome about the year 1659, raised suspicion, and a society of young married women was discovered, presided over by an old woman named Spara, who had learned the art of poisoning from Tofana. Spara and four other members of the society were publicly executed. Tofana continued to live to a great age in a cloister, in which she had taken refuge, but was at last (1709) dragged from it, and put to the torture, when she confessed having been instrumental to 600 deaths. According to one account she was strangled; but others affirm that she was still living in prison in 1730.

The A. T. is usually described as a clear, colourless, tasteless, and inodorous fluid; five or six drops were sufficient to produce death, which resulted slowly and without pain, inflammation, or fever; under a constant thirst, a weariness of life, and an aversion to food, the strength of the person gradually wasted away. It is even stated that the poison could be made to produce its effects in a determined time, long or short, according to the wish of the administrator—a notion generally prevalent in those ages respecting secret poisoning. The most wonderful stories are told of the mode of preparing this poison; for example, the spittle of a person driven nearly mad by continued tickling was held to be an essential ingredient. Later investigations into the real nature of the A. T. lead to the belief that it was principally a solution of arsenic.

A'QUA VI'TÆ (Lat., water of life) is a common term applied to ardent spirits. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life; and as Latin was the tongue employed in the conveyance of knowledge in those days this restorer of health and prolonger of life was naturally christened A. V.

A'QUEDUCT (Lat. *Aquæ ductus*), an artificial course or channel by which water is conveyed on an inclined plain. When an A. is carried across a valley, it is usually raised on arches, and where elevated ground or hills intervene, a passage is cut, or, if necessary, a tunnel bored for it. Aqueducts were not unknown to the Greeks; but there are no remains of those which they constructed, and the brief notices of them by Pausanias, Herodotus, and others, do not enable us to form any distinct idea of their character. The aqueducts of Rome were amongst the most magnificent of all, and the noble supply of water which the city still derives from the three now in use, all of which are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilisation and refinement, when nine were employed to pour water into its baths and fountains.

The following are the names of the Roman aqueducts, chronologically arranged:

1. The *Aqua Appia*, begun by and named after the censor Appius Claudius about 313 B.C. It had a course of between 6 and 7 miles, its source being in the neighbourhood of Palestrina. With the exception of a small portion near the Porta Capena, it was subterranean. No remains of it exist.

2. *Anio Vetus*, constructed about 273 B.C. by M. Curius Dentatus. It also was chiefly underground. Remains may be traced both at the Porta Maggiore and near the Porta Maggiore. From which it quitted the river Anio, above Tivoli, to Rome, is about 43 miles.

3. *Aqua Marcia*, named after the prætor Marcius Rex, 145 B.C., had its source between Tivoli and Subiaco, and was consequently about miles long. The noble arches which stretch the Campagna for some 6 miles on the Frascati, are the portion of this A. which was ground.

4. *Aqua Tepula* (126 B.C.) had its source Tusculum, and its channel was carried over arches of the last-mentioned A.

5. *Aqua Julia*, constructed by Agrippa named after Augustus 34 B.C. Like the was carried along the Marcian Arches, and was also near Tusculum. Remains of last-mentioned aqueducts still exist.

6. *Aqua Virgo*, also constructed by A said to have been named in c spring which supplied it having a girl to some of Agrippa's so of water. The Aqua Vergine, is still entire, having been restored by Nicholas V. and Pius IV. 1568. The Aqua Virgo is near the Anio, in the of Torre Salona, on the Via Collatina, miles from Rome. The original object was to supply the baths of Agrippa;

At Merida there are the ...ins of two aqueducts, of one of which there are ... ...ers still standing, with three tiers of ... the most magnificent structure of this class in Spain, is the A. of Segovia, in Old Castile, for which Spanish writers claim an antiquity beyond that of the Roman dominion; but which, there is reason to believe, belongs to the time of Trajan. At Evora, in Portugal, there is likewise an A. in good preservation, with a *castellum* or reservoir at its termination in the city, consisting of two stories, the lower one being decorated with pillars. But of all the provincial aqueducts, that at Nismes, in Provence, is at once the most remarkable and the best preserved. The following description of it, which we transcribe from Mr Murray's excellent Hand-book for France, will convey to the reader a very vivid conception not only of this A. in particular, but of the very interesting class of works to which it belongs. 'It consists of three rows of arches, raised one above the other, each smaller than the one below it; the lowest of six arches, the centre tier of eleven, and the uppermost of thirty-five; the whole in a simple if not a stern style of architecture, destitute of ornament. It is by its magnitude, and the skilful fitting of its enormous blocks, that it makes an impression on the mind. It is the more striking from the utter solitude in which it stands—a rocky valley, partly covered with brushwood and greensward, with scarce a human habitation in sight, only a few goats browsing. After the lapse of 16 c., this colossal monument still spans the valley, joining hill to hill, in a nearly perfect state, only the upper part, at the northern extremity, being broken away. The highest range of arches carries a small canal, about 4½ feet high and 4 feet wide, just large enough for a man to creep through, still retaining a thick lining of Roman cement. It is covered with stone slabs, along which it is possible to walk from one end to the other, and to overlook the valley of the Gardon. The height of the Pont du Gard is 188 feet, and the length of the highest arcade 873 feet. Its use was to convey to the town of Nismes the water of two springs, 25 miles distant. . . . The conveyance of this small stream was the sole object and use of this gigantic structure, an end which would now be attained by a few iron water-pipes.' Neither the date nor the builder of the Pont du Gard is known with certainty, but it is ascribed to Agrippa, the nephew of Augustus; a conjecture which is rendered probable by the fact of his having restored the Appian, Marcian, and Anienan, and constructed the Julian A. at Rome. The importance which the Romans attached to their aqueducts may be gathered from the fact, that special officers, invested with considerable authority, and, like all the higher officials, attended by lictors and public slaves, were appointed for their superintendence. Under the orders of these 'guardians of the waters,' we are told that, in the time of Nerva and Trajan, about 700 architects and others were employed in attending to the A. These officials were divided into various classes, and known by different names, according as their duties related to the care of the course of the A., the Castella or reservoirs at its termini, the pavement of the channel, the cement with which it was covered, and the like.

The construction of aqueducts in recent times is comparatively rare, water being now generally conveyed in pipes; but two instances are worthy of notice—the *Lisbon* A., and the *Croton* at New York. The former, completed in 1738, is about 3 leagues in length; near the city, it is carried over a deep valley for a length of 2400 feet, by a number of bold arches, the largest of which has a height of 250 feet, and a span of 115. The Croton A., which conveys the waters of the Croton river for a distance of 38 miles to the city of New York, is one of the greatest undertakings of modern times. It was

commenced in 1837, and finished in 1842, and is calculated to discharge upwards of 60,000,000 gallons in 24 hours. As the magnificence of aqueducts depends upon the height and number of arches requisite to carry them across valleys, it may give some idea of that under consideration when it is stated that Haarlem River is crossed by fifteen arches, seven of which are of 50 feet span, and eight of 80 feet, the greatest height being 150 feet from the foundation to the top of the mason-work.

A'QUEOUS HUMOUR is the fluid which occupies the space in the eye between the back of the cornea and the front of the lens, which, in fœtal life, is divided into an *anterior* and *posterior* chamber by the membra pupillaris (q. v.), and in adult life, by the iris. It consists of water, with, according to Berzelius, about a fiftieth of its weight made up of chloride of sodium and extractive matters held in solution.

Anatomists are not agreed as to the spring of this watery secretion, and are inclined to doubt the existence of a special secreting membrane, which used to be taken for granted. However, a layer of delicate epithalial cells, which exists at the back of the cornea (q. v.), is probably concerned in its formation. It is rapidly re-secreted if allowed to escape by any wound in the cornea, and in some cases is formed in such quantity as to cause dropsy of the eye (*hydrophthalmia*).

A'QUEOUS ROCKS. In Geology, every layer which forms a portion of the solid crust of the earth is called a rock, it matters not whether its particles are incoherent, like soil or sand, or compacted together, like limestone and sandstone—to all alike, irrespective of popular usage, the geologist applies the term *rock*. In this wide sense, the rocks of the earth's crust are either igneous (q. v.) or sedimentary. These sedimentary rocks have an aqueous origin, with the exception of a very limited number, like drift-sand, which are brought into their present position by the action of the wind. Unlike the igneous rocks, whose particles have assumed their present form in the position they occupy, the materials of the A. R. have evidently been brought from a distance. They owe their origin to some older rock, whose decomposition or destruction has afforded the materials. The parent rock can often be identified. Its distance is indicated by the condition of the materials, whether they are rounded and water-worn, or angular and shingly.

The agents now at work, and which have been active in past geological ages, rubbing down and transporting the materials from which these rocks are formed, are the following: 1. *The sea*, destroying the rocks and cliffs, and beaches which form its boundary, and carrying off the eroded materials to form new rocks below the level of the sea. 2. *Rivers*, including the action of their smallest tributary rills, and even of the drops of rain, for these abrade and carry off the almost imperceptible particles from the surface where they fall; and when united, they form the rill with its suspended sediment, and these again unite to form the river, which in its course not only retains what it has got, but scoops up more from its own bed, and carries all to the sea or lake, to deposit it there as a new stratum. It is difficult to estimate the influence of this agency. Sir Charles Lyell calculates that the Nile annually deposits in the Mediterranean 3,702,758,400 cubic feet of solid matter. 3. *Glaciers and icebergs*. These enormous moving masses of ice are not only loaded with rock fragments, which are deposited as the ice melts, but are ever abrading the rocks over which they pass, and thus supply materials to form new layers. 4. Several stratified rocks have an evidently *organic origin*, such as chalk, and s stones chiefly composed of animal consisting of vegetable carbon; but been influenced in their formation by as to justify us in classifying th 5. The same remark applies to ro been *precipitated from a fluid* with rials existed in chemical combination, as h case with beds of salt, gypsum, and calcar

As the result of these various actions, series of rocks which, from their compos be classed as Arenaceous, Argillaceous, Carbonaceous, Saline, and Silicious. We to these terms for the descriptions rocks included under them.

The arrangement of the A. R. dependi different ages, is of more importance i geology than that depending on their int stitution. When a section of the earth examined, it is found to be composed of layers which have been produced Comparing this with sections in otl noticed that there is a regularity parts; for beds of the same structu different localities, and these occupy tive position to the adjacent beds. observations have shewn that the crust of is composed of a *regular* series of es formed one after another, during succ of time. This general induction fo the following classification. For the the included strata we must again of the different divisions:

I. TERTIARY OR KAINOZOIC EPOCH—1 cial Deposits or Recent Period; 2. Period; 3. Pliocene or Upper Tertiary Miocene or Middle Tertiary Period; 4 Lower Tertiary Period.

II. SECONDARY OR MESOZOIC 5 ceous Period; 7. Oolitic Period; 8.

III. PRIMARY OR PALÆOZOIC EPO Period; 10. Carboniferous Period; 11. Old Red Sandstone Period; 12. Silurian Cambrian Period.

Councils were held at A. in 381, 558, A.D.

S, THOMAS, or THOMAS OF AQUINO, ost influential of the scholastic theolo- the family of the Counts of Aquino, in of Naples, and was born in the Castle a in 1224. He received the rudiments tion from the Benedictine monks of , and completed his studies at the Naples. A strong inclination to philo- ilation determined the young nobleman, rill of his family, to enter (1243) the minicans. In order to frustrate the is friends to remove him from the con- sent away from Naples, with the view of going to France; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q.v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope. At Cologne he pursued his studies in such silence, that his companions gave him the name of the 'Dumb Ox.' But Albert, his master, is reported to have predicted, 'that this ox would one day fill the world with his bellowing.' Thoroughly imbued with the scholastic, dialectic, and Aristotelian philosophy, he came forward, after a few years, as a public teacher in Paris. His masterly application of this philosophy to the systematising of theology, soon procured him a distinguished reputation. It was not, however, till 1257, that A. obtained the degree of doctor, as the university of the Sorbonne was hostile to the mendicant monks. He vindicated his order in his work, *Contra Impugnantes Dei Cultum et Religionem*; and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued to lecture with great applause in Paris, till Urban IV., in 1261, called him to Italy to teach philosophy in Rome, Bologna, and Pisa. Finally, he came to reside in the convent at Naples, where he declined the offer of the dignity of archbishop, in order to devote himself entirely to study and lecturing. Being summoned by Gregory X. to attend the General Council at Lyon, he was surprised by death on the way, 1274, at Fossanuova, in Naples. According to a report, he was poisoned at the instigation of Charles I. of Sicily, who dreaded the evidence that A. would give of him at Lyon.

Even during his life A. enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the 'Universal,' the 'Angelic Doctor,' and the 'Second Augustine.' A general chapter of Dominicans in Paris made it obligatory on the members of the order, under pain of punishment, to defend his doctrines. It was chiefly the narratives of miracles said to have been wrought by A. that induced John XXII., in 1323, to give him a place among the saints. His remains were deposited in the convent of his order at Toulouse. Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his writings display a great expenditure of diligence and dialectic art, set off with the irresistible eloquence of zeal. His chief works are—a *Commentary on the Four Books of Sentences of Peter Lombard*, the *Summa Theologiæ*, *Quæstiones Disputatæ et Quodlibetales*, and *Opuscula Theologica*. He gave a new and scientific foundation to the doctrine of the church's treasury of works of supererogation, to that of withholding the cup from the laity in the communion, and to transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the 'Father of Moral Philosophy.' The definiteness, clearness, and completeness of his method of handling the theology of the church, gave his works a superiority over the text-books of the earlier writers on systematic theology. His *Summa Theologiæ* is the first attempt at a complete theological system. Accordingly, Pius V., to whom we owe the publication of the completest collection of A.'s works (18 vols., Rome, 1570; a newer but less trustworthy ed., 23 vols., Paris, 1636—41), ranks him with the greatest teachers of the church. In his philosophical writings,

the ablest of which is his *Summa Fidei Catholicæ contra Gentiles*, he throws new light over the most abstract truths. The circumstance of A. being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the 14th c., Duns Scotus (q. v), a Franciscan, came forward as the declared opponent of the doctrines of A., and founded the philosophico-theological school of the Scotists, to whom the *Thomists*, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to Nominalism (q. v.), although they held the abstract form to be the essence of things; they followed the doctrines of Augustine as to grace, and disputed the immaculate conception of the Virgin. The Scotists, again, inclined to Realism (q. v.), and to the views of the Semipelagians, and upheld the immaculate conception.

AQUITA'NIA, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes. Augustus, when he divided Gaul into four provinces, added to A. the country lying between the rivers Garonne and Loire. Afterwards, A. passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Though subjugated by Charlemagne, the duchy again claimed independence under the weak monarchs of the Carlovingian dynasty. In 1137, it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of A. In 1152, A. became an English possession through the marriage of Henry II. with Eleanor, whom Louis had divorced, and a long series of disputes took place between England and France respecting A., which was at length ultimately united to the crown of France by Charles VII. in 1451.

ARABESQUE (Fr.), means merely *after the Arabian manner;* and, so far as etymology is concerned, might therefore be general in its application. In practice, however, it is used to characterise a peculiar kind of fantastic decoration commonly employed in conjunction with architecture, and which the Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now applied, was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in enriching their monumental decorations. But the A. of the Moors differed from that of the Egyptians in entirely excluding the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confining itself entirely to the foliage, flowers, fruit, and tendrils of plants and trees, curiously and elaborately intertwined. This limitation of the field of A. was again departed from when the decorations were discovered on the walls of the baths of Titus, in the time of Leo X.; and more recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern A. consists usually of combinations of plants, birds, and animals of all kinds, including the human and embracing not only every natural stepping without hesitation beyond th... nature. Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouins, are well known to entertain very loose notions of the rights of property. The located tribes, styled Hadesi and Fellahs, are despised by the Bedouin, who scorns to be tied down to the soil, even where such bondage might make him wealthy. As Ritter in his Comparative Geography observes—Arabia 'is the anti-industrial central point in the world;' for on every side, branching out to the east or west, we find industry making progress, while here centuries pass away without any improvement save what has been introduced, almost compulsorily, by foreigners. The trade carried on by exports of coffee, dates, figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa, or when Aden was in its prime and the Red Sea was the great commercial route. A. has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities. Few nations have approached so near as the Arabs to the condition of standing still in a moral and social point of view. Considering how little progress has been made, it is remarkable that a greater degeneracy has not taken place. Even in the desert the children are taught to read, write, and calculate; and in the towns, education to a certain degree is general. The division of the people into so many tribes is a barrier to everything like a great national improvement; indeed, the word national can hardly be properly applied to the Arabs. It would require a series of extraordinary events to develop afresh that terrible unity which Mohammed gave A. for a time. The government is patriarchal, and the chief men of the various tribes have the title of Emir, Sheik, or Imaum. Their function appears limited to leading the troops in the time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

To number all the distinct states of A. would be impossible in the present state of our knowledge; but the seven great divisions are those which we have enumerated. Of these the most important at present is Nedjed, a state which, while under Wahabite fanaticism it rose rapidly into leading power, and seemed for a time to wane, yet in 1863, secured, by the reduction of the town Oneyzah, and the adhesion of Oman, its own pre-eminence. Yemen possesses two very important commercial towns, Mocha and Lohcia, situated on the coast of the Red Sea; Oman has of late made considerable advances in civilisation. It forms to some extent an exception to the general lack of manufacturing activity exhibited by the Arabians, having manufactures of silk and cotton turbans, sashes, canvas, arms, gunpowder, &c. The Imaum of Muscat formerly claimed authority over the whole of Oman, the islands in the Persian Gulf, a portion of the Persian coast, and a vast extent of territory on the east coast of Africa, including some valuable islands. Rostak is another large town inland from Muscat. The district or division of Hedjaz contains the holy cities of Mecca and Medina, with their seaports, Jiddah and Yembo (q. v.).

The History of Arabia, before the time of Mohammed, is involved in mystery, and has little interest, on account of its want of connection with the world's general progress. The aborigines of A. were probably Cushites, most of whom, on account of the hostile immigration of certain Semitic races,

descended from Joktan, grandson of Shem, passed over into Abyssinia. A few, however, remained, who inhabited the western coasts. Subsequently, another Semitic race, descended from Abraham, settled in the land. The oldest Arabian tribes are now extinct, and only a traditional memory even of their names exists; but the Semitic chiefs, Joktan or Kahtan, and Ishmael, are generally considered to be the fathers of the present inhabitants. The descendants of the former are the pure Arabs; those of the latter are held to be only Arabicised. The princes of A. belong wholly to the first. A great-grandson of Joktan, Himzar or Homeir, inaugurated a dynasty—the Himyarides or Homeritæ—which ruled in Yemen for upwards of 2000 years. This was a prosperous time. The Arabs of Yemen, and partly those of the desert, dwelt in towns and cultivated the soil; carried on commerce with the East Indies, Persia, Syria, and Abyssinia, in the last of which countries they planted numerous colonies. The rest of the people, however, lived nomadically, as now. Bravely, for thousands of years, they maintained their freedom, their faith, and their peculiar customs against the assaults of the great military empires. Neither the Babylonian and Assyrian, nor the Egyptian and Persian kings could reduce the Arabs to a state of subjugation. Alexander had determined to try his power against A., when death interrupted his plans. Three centuries after Alexander's death, the Romans had extended their empire to the borders of A., and Trajan, in 107 A.D., penetrated far into the interior; but though the northern chieftains were brought into a formal subjection to the Empire, A. was not made a Roman province. The old Himyarides in Yemen stoutly maintained their independence, and an expedition against them in the time of Augustus completely failed. With the decay of the Roman empire, strife and lawlessness increased. The Arab races continued in a scattered, disorganised condition, and many hundreds of years passed away in intestine wars, during which the central highland region was the scene of those feuds of the Arab clans so copiously sung by the native poets. Christianity found an early entrance into A. The Jews, in considerable numbers, migrated into A. after the destruction of Jerusalem, and made many proselytes, especially in Yemen. This diversity of creeds in the peninsula was favourable to the introduction of the doctrine of Mohammed, which forms the grand epoch in Arabian history, and brings it into close connection with the general history of civilisation. Now, for the first time, the people of A. became united, and powerful enough to erect new empires in the three quarters of the world. The dominion of the Arabs, from the time of Mohammed to the fall of the Califat of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilisation. (See the articles MOORS, CALIFS.) But the movements which had such great effects on the destinies of other nations, produced but little change in the interior of A.; and, after the brilliant career of conquest was ended, the peninsula was left in an exhausted condition. Then followed the subjugation of Yemen by the Turks in the sixteenth century; their expulsion in the seventeenth century; the dominion of the Portuguese over Muscat, 1508–1659; the conquests of Oman and the temporary victories gained by the Persians at the close of the sixteenth century; and, lastly, the appearance of the Wahabis (q. v.) (1770), whose moral influence is still felt. The latter took an important part in the political affairs of A., but their progress was interrupted by Mehemet Ali, the Pasha of Egypt, who subjugated the coast-country of Hedjaz, with some parts of the coast of Yemen, and in 1818 gained a decisive advantage through victory of Ibrahim Pasha. The subsequent [illegible] of the year 1840, in Syria, compelled Mehemet [illegible] ever, to concentrate his forces, and to [illegible] claims upon the territories lying beyond the Red [illegible] See WAHABIS, in SUPP., Vol. X.

ARA'BIAN ARCHITECTURE. So [illegible] able is the connection between architecture [illegible] religion, that it may be stated as a general [illegible] that no sooner is a new religion engendered [illegible] it finds expression in new architectural [illegible] Of this we have an interesting instance in [illegible] simultaneous rise of Mohammedanism, and of [illegible] style of architecture commonly called Arabian [illegible] Moorish, but to which the name of Mohammedan [illegible] might far more appropriately be given, since [illegible] it has everywhere followed the religion of [illegible] Crescent, and that the Arabians previously had [illegible] architecture peculiar to themselves. It is [illegible] remarkable that the style of which we speak [illegible] to have arisen, as it were, undesignedly, or [illegible] events, without any conscious effort on the [illegible] the people amongst whom it first appeared [illegible] followers of the Prophet contemplated nothing [illegible] liar in their ecclesiastical structures; and [illegible] their mosques were built by Christian [illegible] from Constantinople. As a natural consequence [illegible] they resembled Byzantine churches, modified

Moorish Gateway.

countries of which the Moors successively [illegible] themselves by the features of the existing [illegible] Gradually the new and fanciful [illegible] known as Arabesque (q. v.) was added to [illegible] nised features of Greek and Roman [illegible] exclusion of animal figures, which their [illegible] of the very appearance of idolatry [illegible]

an overwhelming torrent, they passed
over the neighbouring states, and in the short space of eighty years from the death of their prophet, had extended their dominion from Egypt to India, and from Lisbon to Samarcand. During this time nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, by their intercourse with civilised nations, the Arabian conquerors were themselves subjected to the humanising influence of letters, and, after 749 A.D., or during the reign of the Abassides, literature, arts, and sciences appeared, and were generously fostered under the splendid sway, first of Almansor (754—775), and afterwards of the celebrated Harun-al-Raschid (786—808). Learned men were now invited from many countries, and remunerated for their labours with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The Calif Al-Mamun, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give instruction to the former. There are few instances of such a price offered for lessons in philosophy. Under the sway of the same Al-Mamun, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivalled the literary fame of Bagdad, and, generally, in the 10th c., the Arabs appeared everywhere as the preservers and distributers of knowledge. Pupils from France, and other European countries, then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were fourteen academies, with many preparatory and upper schools in Spain, and five very considerable public libraries; that of the Calif Hakem containing, as is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shews a rapidity of progress in knowledge almost as remarkable as the career of Arabian conquest.

In geography, history, philosophy, medicine, physics, and mathematics, the Arabians rendered important services to science; and the Arabic words still employed in science—such as algebra, alcohol, azimuth, *zenith*, nadir, with many names of stars, &c.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. In Africa and Asia, the boundaries of geographical science were extended, and the old Arab treatises on geography and works of travels in several countries by Abulfeda, Edrisi, Leo Africanus, Ibn Batuta, Ibn Foslan, Ibn Johair, Albirúni the astronomer, and others, are still interesting and valuable.

History was also studiously cultivated. The oldest Arabic historian of whom we know is Mohammed-al-Kelbi (died in 819). About the same period, however, flourished several other historians. After the dawn of the 10th c., history became a favourite study of the Arabs. The first who attempted a universal survey of the subject were Masudi, Tabari, Hamza of Ispahan, and Eutychius, the Christian patriarch of Alexandria. Masudi's work is entitled *Meadows of Gold and Mines of Gems*. These were followed by Abulfaraj and George Elmakin (both Christians), Abulfeda, and others. Nuvairi wrote a *History of Sicily under the Government of the Arabs*. Various sections of Arabic histories relating to the Crusades have been translated into French. On the dominion of the Arabs in Spain, several works were written by Abul-Kasem of Cordova (died in 1139), Temini,

and others. For extended notices we may refer the student of Arabic Literature to the translations by Quatremere and others; but especially to the *Encyklopädischen Übersicht der Wissenschaften des Orients*, by Von Hammer (2 vols. Leip. 1804).

Arabian theology and jurisprudence are intimately connected, and both founded on the Koran; but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Ommaiade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence, the vague statements of the Koran were soon variously interpreted, and a host of sects gradually arose. Of these, four only are regarded as orthodox, leaving not less than seventy-two heretical, whose discordant tenets are stated in the work of Sharistani (edited by Cureton, London, 1842). The four orthodox sects are: the Hanefites, who do not reject tradition, but subordinate it to rationalism; the Shafites, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Malechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Koran. The interpretation of the Koran constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Samakhshari and Baidhawi. The conquest of Algiers has rendered the study of Arabic or Mohammedan law indispensable to the French. The result is, that several most important works on that subject have appeared of late from the Paris press, such as *Précis de Jurisprudence Musulmane, selon le Rite Maléchite par Khalil-Ibn-Ishak* (translated by Perron, Paris, 1848), and *Législation Musulmane Sunnite, Rite Hanéfi* (Paris, 1848).

Arabian philosophy, which was of Grecian origin, held the same relation to the Koran as the Scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all Western Europe, through translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: Alkendi of Basra, who flourished about the beginning of the 9th c.; Alfarabi, who wrote a work on First Principles in 954; Avicenna (died 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany; Ibn-Yahya, who acquired a high reputation as an original thinker; Alghazali (died 1111), who wrote a book entitled *The Destruction of all Idolatrous Philosophical Systems*; Abubekr-ibn-Tofail (died 1190), who taught in his philosophical novel *Hai-ebn-Yokdan* (edited by Pococke, Oxford, 1671) the development of men from animals; and his pupil, Averrhoes, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Ecoles Philosophiques chez les Arabes*, &c., by Schmölders (Paris, 1842), and Ritter's *Über unsere Kenntniss der Arab. Philosophie* (Gött. 1844).

Many of these illustrious Arabian philosophers were also physicians. The great skill which the Arabs acquired in their knowledge of the uses and properties of medicinal herbs, is traced by Humboldt to their geographical position. The southern part of Arabia is characterised by the highly developed vital force pervading vegetation, by which an a aromatic and balsamic juices is yielded various beneficial and deleterious sub attention of the people must early have to the natural products of their native s brought as articles of commerce fr coasts of Malabar, Ceylon, and Hence arose the wish to disti one another these precious which were so important to &c. . . . . The science of with reference to its sc tially a creation of the Arabs, to and, at the same time, one of the richest knowledge—that of the Indian physicians early opened. Chemical pharmacy (see was created by the Arabs, whilst to them due the first official prescriptions reg preparation and admixture of different agents—the dispensing recipes of the These were subsequently diffused over Europe by the School of Salerno' (E vol. ii. p. 581, Bohn's translation). *materia medica* naturally led to b try. For three centuries—from t —a rich scientific culture prevailed philosophy and medicine sprung up Bagdad, Ispahan, Firuzabad, Bokhara, Alexandria, Cordova, &c. In all de medical science a great advance was in anatomy. The reason of this ex the fact, that the Koran forbids the bodies. The most famous writers on Aharun, Alkendi, Avicenna (q. v.), wh *Canon of Medicine*, for a long time th book on the subject; Ali-ben-Abbas Soleiman, Abulkasem, Averrhoes (q. v.) a complete system of medicine: Ali-ben

In mathematics, the Arabs de by the introduction of the notation now in use, of the chord (in trigonometry), and of a application of algebra. Astronomy studied in the famous schools and Bagdad and Cordova. Alzahan wr Nassireddin translated the Eleme Jeber-ben-Afla furnished a comment nometry of Ptolemy, &c. The *Almag* Astronomy by Ptolemy, was translate by Alhazi and Sergius as early as 812 c., Albaten observed the advance of th apsides in the earth's orbit; al-Batani, the obliquity of the wrote a theory of the planets; and on astronomical instruments.

Besides these advances in the solid knowledge, the genius of the Ar flowered into poetry. N rous poe all lands where the chi f the des their irresistible fa ir not like the rude, a le patriarchal people; in gradu prevailing culture, and took, epoch of Arabian civilisation. Motenebbi, Abul-Ala, and reputation for their delicate eulogy of Mohammed; Hamz introduce novels in verse under the title of *Makâm* which was brought to perfe for his ingenious allegori the Flowers.' Besides th fantastic prose literature which the craving for the characteristic of the restless, was richly gratified. Roman

The most famous of these are: *The* [illegible] *Entertainments* (q. v.), *The Exploits of* [illegible] *oits of the Champions*, and *The Exploits* [illegible]. In fact, with the exception of the [illegible] was no sort of poetry which the Arabs attempt. The effect of this universality [illegible] in Arabic literature was, that it exercised [illegible] influence on modern European poetry. [illegible] of fays, charms, sorceries, and the whole [illegible] chinery of enchantment passed into the [illegible] West. During the middle ages of [illegible] wy, several of the most popular and [illegible] books were of Arabic origin; such [illegible] *Wise Masters*, and *The Fables of* [illegible] ugh the Arabians themselves borrowed [illegible] the Persian stories and the Greek

[illegible] culture of the early ages of Moham- presents a strong contrast to the ignor- [illegible]h now prevails among the Arabs. The [illegible]aticism of the Turks nipped the blooming [illegible] East; sunk in stupid indolence, [illegible]; in apathetic resignation their [illegible] return to higher modes of life. [illegible] furnishes now nothing worthy of notice. [illegible] spends itself principally in commentaries [illegible], in scholastic discussions on the subject- [illegible] dogmatics and jurisprudence, and in [illegible]ammatical disquisitions concerning the old [illegible]ech, generally acute and subtle, but always [illegible]le and unenlivening. The swift and mobile East has departed, and pedantic dul- ed its place. There are 'Dryasdusts' [illegible] desert. A few modern writers have [illegible], with more or less success, to imitate [illegible] forms of thought and sentiment. Of these [illegible]tioned Michael Sabbagh of Syria (*La* [illegible]*agère*, Arabic and French, Paris, [illegible]ik, Refaa of Cairo (*The Broken Lyre*, [illegible]7; *Manners and Customs of the Euro-* [illegible]ro, 1834; *Travels in France*, Cairo, 1825); [illegible]-Effendi, of Beirut, who wrote the critical [illegible]s in De Sacy's edition of Hariri (*Epistola* [illegible]ripsiæ, 1848).

[illegible]bic also possesses a Christian and Jewish [illegible] which, however, is chiefly ecclesiastical. [illegible]al ornaments are Eutychius, Elmakin, [illegible]faraj. Translations of the Old Testa- [illegible] made not from the Hebrew, but from [illegible]agint, or from Latin versions. In the [illegible]s, the Spanish Jews employed Arabic for [illegible]al compositions; and several of the most [illegible] works of Mose's Maimonides, &c., were written in that tongue.

[illegible]bic *language*, it has been remarked, is at *rich* and *poor*. It is necessarily destitute of [illegible]le words describing those ideas and objects [illegible]y civilisation can develop or produce; but, [illegible]er hand, the rich and nimble fancy of the [illegible] has multiplied, to an almost incredible [illegible] synonyms of their desert-tongue, so that [illegible]ases several hundreds of expressions are same thing. The Arabic belongs to the [illegible]mitic family of languages, among which [illegible]gnished for its antiquity and soft flexible [illegible] is divided into two dialects—a northern [illegible]ern. The former, through the instru- [illegible] of the Koran, became the predominant [illegible] literature and commerce throughout the [illegible]nt of the Arabian dominions; the latter, [illegible] Himyaritc, although in all probability [illegible] of the Ethiopic language and writing, is [illegible]vet only by a few inscriptions, &c. The [illegible]bic grammarian is Abul-Aswad-al-Duli, [illegible]d under the fourth calif, Ali. The [illegible]anced the prosody and metre of the Arabian poets to a system, was Khalil-ben-Ahmed- al-Ferahidi of Basra. Al-Jauhari, who died in 1009 A.D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Sihah* ('Purity'), and which is held in high estimation to this day. Mohammed-ben- Yakub-al-Firuzabadi, who died in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kamus* ('The Ocean'), which is the best lexicon in the language, and has consequently been translated into Persian and Turkish. Jordahani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidani made a large collection of Arabic 'sawa,' apophthegms, &c., which was published by Freytag, Bonn, 1838. Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwith- standing the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th c.; after them, the Germans, French, and English. It is now, how- ever, beginning to be considered a necessary part of a learned theological education. The modern Arabic of the inhabitants is substantially the same as that of the Koran, but the lapse of time has gradually introduced changes in the grammatical forms of the language, similar to those which have occurred in other languages. The purest Arabic is said to be spoken in Yemen, or *Arabia Felix*. With the exception of the Roman characters, the Arabic have been more widely diffused than those of any other tongue on the face of the earth. (See Möller's *Oriental Palæography*, Eisleben, 1844, &c.)

Arabic Writing.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Koran was busily carried on. Its characters are rude and coarse, and it has particular symbols for only sixteen of the twenty-eight Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th c. it was displaced for common purposes by a current hand- writing, the *Neskhi*, introduced by Ebn Mokla. This is the character still in use. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line.

ARABIAN NIGHTS' ENTERTAINMENTS, a collection of Oriental tales, first made known to Europe by Antony Galland, a French orientalist, under the title of *The Thousand and One Nights, Arabian Stories, Translated into French*. They were published at Paris, in 12 volumes 12mo, from 1704 till 1717, and were received by many as the production of the genius of the translator himself, rather than the collection of *an unknown Arabian author*, as Galland had stated in his dedication. Oriental scholars did not hesitate at first to declare against their authen- ticity, and denounce them as forgeries. Having taken only an obscure place in the literature of the East, and their style unfitting them from being classed among models of eloquence or taste - having no object of a religious, moral, or philosophical kind in view, while the manners and customs delineated in them were different from all received ideas of those of the Moslem nations - their success took the critics by surprise. The work became highly esteemed by the public; it filled Europe with its fame; it had abundance of readers, and no lack of

editors. Few books have been translated into so many different languages, and given delight to so large a number of readers. It may be said that, in these Oriental tales, there has sprung up a new branch of literature, for their influence on the literature of the present day is easily discernible. Here are found, depicted with much simplicity and great effect, the scenes of the town-life of the Moslem. The prowess of the Arab knight, his passion for adventure, his dexterity, his love and his revenge, the craft of his wives, the hypocrisy of his priests, and the corruptibility of his judges, are all dramatically delineated—far more vividly represented, in fact, than is possible in a book of travels; while gilded palaces, charming women, lovely gardens, and exquisite repasts captivate the senses of the reader, and transport him to the land of wonder and enjoyment. Besides entertaining the mind with the kaleidoscopic wonders of a teeming and luxurious fancy, which is their most obvious merit, they present a treasure of instruction upon life in general, and Oriental life in particular. And this is undeniable, notwithstanding the fact, that the aspects of society they depict are far from standing high in the social scale, either as to civilisation or morality. In them no story is to be found that will rank in morality with the story of Joseph and his brethren, simply because the Moslem faith will not admit of that, any more than the decline of Arab civilisation at the time the tales must have been originally promulgated. Indeed, the first translator, having a conviction of a demoralising tendency of this kind, avoided giving several objectionable parts of some of the stories. The thread of the narrative in these entertainments is generally simple and clear, often leading into the departments of fable, and occasionally into the regions of the supernatural and the domains of popular superstition. The tales, even when long, are not tiresome; for they consist of shorter stories branching off from the main one, or rather encased within it, the smaller within the larger, and perhaps a smaller within that, like the little boxes used by conjurors.

For many years all doubt as to the authenticity of the *Thousand and One Nights* has been dispelled. Several MS. copies have been found, and no less than four editions of the Arabic text have been published. A more thorough acquaintance with medieval and modern Arab life has proven the genuineness of the stories, and the truthfulness of their general representation of the mind of the Moslem. In them there are evident signs of a declension from a refined and superior civilisation; the marvellous and supernatural is predominant; despotism in all its forms is manifest; and a prevalent falsity and insincerity of character visible, not only in the narrative, but in the tone of common conversation, replete as it is with oaths and asseverations.

The origin of the work—where and by whom written—is still involved in mystery. According to some, the tales are susceptible of a threefold division. The most beautiful, and in fancy the richest, appear to have come from India, the cradle of story and fable; the tender and often sentimental love tales seem of Persian origin; while the masterly pictures of life, and the witty anecdotes, claim to be the product of Arabia. Throughout, however, everything is conformable to the character and customs of the town population of Arabia, and to the Mohammedan faith. The Baron de Sacy, in 1829, thus stated his opinion on these points. Speaking of the work he says: 'It appears to me that it was originally written in Syria, and in the vulgar dialect; that it was never completed by its author; that, subsequently, imitators endeavoured to perfect the work, either by the insertion of novels already known, but which formed no part of the

With these results the face of the he state of trade fully correspond. onstitute the chief articles of exporta- s are tobacco, sugar, wood, oil, hides and horns, elephants' teeth, dried birds'-nests. The imports consist of s, muslins, cutlery, and glass. seen various indications of a volcanic In the islands of Ramree and Cheduba rings of muddy water which emit vapour and flame to the height of several hundred feet. Of the mineral resources very little is known. Iron-ore has been found, but not in such quantity and quality as to come into profitable competition with British iron. Coal also exists, which is understood to be good, but, from whatever cause, it has not been extensively worked. There are no lakes in the province, nor are there any rivers of much importance, though the Aeng, which appears to be the most available among them, is said to be navigable during spring-tides to 45 miles from its mouth.

Two severe earthquakes have taken rely in 1763 and 1833—the latter un, in several places, muddy water of ll, and also, on one particular spot,

ARACARI, or ARICARI (*Pteroglossus*), a genus of birds closely allied to the Toucans (see TOUCAN), and differing from them chiefly in the somewhat smaller bill, which is not so thick as the head. They are generally also of smaller size, and the prevailing colour of their plumage is green, often varied with brilliant red and yellow. Like the toucans, they are natives of the warm parts of South America.

ARACEÆ. See AROID.

ARACHIS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, natives of the warm parts of America, of which, until recently, the only known species was the *A. hypogæa*, sometimes called the underground kidney-bean, and more frequently the ground-nut. It also receives the names of earth-nut, American earth-nut, and mandubi. It is an annual plant, with hairy pinnate

Arachis hypogæa.

leaves, which have four leaflets. The flowers are yellow, the standard veined with red. After flowering, the flower-stalks elongate and bend towards the earth, into which the pods penetrate, ripening underground. The pods have a lining of a sort of net-work, and generally contain two, three, or four seeds, which are about the size of a hazel-nut, of a sweet taste, with a little of the flavour which belongs to most kinds of pulse. This plant is now cultivated in all the warm regions of the globe, and its usefulness is such that its cultivation is likely to extend. It was introduced from Peru into Spain, and thence

France. It succeeds in favourable situations of France, where it is sown after ho ht to be over, and yields fold. Its cultivation is

so general in the western parts of Africa, and even in the interior, that doubts have been therefore entertained of its American origin, of which, however, the most eminent botanists seem to be quite satisfied. The seeds are sometimes eaten raw, but more generally boiled or roasted. In New Spain, and in some parts of Africa, they form one of the principal articles of food; but the importance of the plant is chiefly owing to the fixed oil contained in them, which is used for the same purposes as olive or almond oil, and is quite equal to olive oil either for lamps or for the table. This oil is also much used in Spain in the manufacture of soap and of chocolate. A bushel of the seeds yields one gallon of oil, when expressed cold; if heat is applied, the quantity is greater, but the quality inferior. It has become a considerable article of commerce. The *A. hypogæa* delights in a light and sandy, but at the same time fertile, soil. The seeds are dug up as roots or tubers usually are. The root has qualities resembling those of liquorice, for which it is sometimes used. The herbage is good food for cattle. Several new species of this genus have been discovered in Brazil.

ARA'CHNIDA, or **ARACHNIDES** (from the Gr. *arachne*, a spider), a class of articulated animals, commonly regarded as intermediate between insects and crustacea. They were included by Linnæus amongst insects, and placed in the order *Aptera*. Like the crustacea, they have the head and thorax united into one piece, but they differ from them and from insects in having simple eyes, and in the absence of proper antennæ, instead of which many of them are provided with a sort of antennal claws called *cheliceræ*. These and other organs connected with a complex mouth, disappear, however, in some of the lower kinds, which have merely a sort of proboscis for suction. Some of them breathe by means of pulmonary cavities; others by tracheæ, like insects; and upon this difference is founded the primary division of the class into two orders —*Pulmonaria* and *Trachearia*. Spiders and scorpions belong to the first of these orders, and mites, ticks, &c. (*Acari*) to the second. Some of the A. inhabit water, but their mode of respiration is that of terrestrial animals; and they seem to carry air with them by means of the hair which covers their bodies. The sexes are distinct. They are oviparous. They have two or more eyes, very frequently eight; and the relative position of these affords marks for distinction of genera. They have generally eight legs, but some have only six. With the exception of the acari, they are solitary in their mode of life, and most of them prey upon insects, of which, however, in general, they only suck the blood. Some of the lower kinds are parasitic upon insects, and a few live on decaying animal and vegetable substances. (See *Acarus*, Mite, Scorpion, Spider, and Tick.)

Mygale fodiens.

ARA'CHNOID MEMBRANE, one of the three coverings of the brain and spinal cord, is a thin, glistening, serous membrane, which, by its parietal layer, adheres inseparably to the dura-mater on its outer side, and more loosely to the pia-mater which is between it and the brain substance. Between the pia-mater and the A. M. in some situations there are considerable intervals (sub-arachnoi they are filled with a fluid named cereb presence of which is necessary to the n of the nervous centres. See CEREBR —PIA-MATER.

ARAD, a town in the district of A Hungary. It is situated on the right Marosh, an affluent of the Theiss, and Old A., to distinguish it from New A built on the opposite side of the ri population (1869) of 32,725, inclu are very wealthy. It carries on tobacco, &c., and was at one cattle-market in Hungary, and inferior to Pesth and Debreczin. c., it was often captured, and at by the Turks. Its new fortifications, 1763, made A. an important position in t tionary war of 1849, when it was occupi considerable time by the Austrian general capitulated here in July 1849. Kossuth issued his proclamation of in which he expressed in imp despair of the Hungarian caus After the catastrophe of Világo- August, A. was surrendered to the the treachery of Görgey.

NEW A., a town in the Banat of Temesv some 4600 inhabitants, including many who are the principal persons in the pro district or province of A. has an area square miles, and contains 304,713 inhabi eastern district is occupied by a bra the Carpathian mountains, which co quarries, and mines of copper and iron; level, and produces wheat, maize, ties of wine, as well as abundan inhabitants are chiefly Wallachians.

ARÆO'METER. See AREOMETER.

A'RAFAT, MOUNT, or *Jebel-er-'rahm* tain of Mercy'), is a granite hill about S.E. of Mecca, which is believed by medans to be the spot where Adam, the angel Gabriel, met again his wife punitive separation of 200 years, on ac disobedience in Paradise. It is not a high, but its circuit is a mile and importance since the time of from its being the scene of a ye faithful who visit Mecca. Bu nessed the procession of 1814, than 70,000 people were present, and forty different languages were spoken. part of the religious ceremony of this sermon, the hearing of which entitles and privileges of a Hadji.

A'RAGO, DOMINIQUE, a cele astronomer and natural philosop February 26, 1786, at Est near the department of the E n Pyre early age of seventeen, he l School at Paris, where vivid intelligence he exhausted all questions of Legendre, excited every one. In 1804, he became Observatory at Paris. Two years was engaged, with Biot and others, government, to carry out the measu of the meridian, which had be Delambre and Méchain. A. and it from Barcelona to the Bale *savans* established themselves Mount Galatza, one of the h branch of the Eastern Pyr for many months, commun

aish collaborateurs, across the Mediterranean
ttle isle of Iviça, though many a night the
empests destroyed their hut along with the
f weeks. Visitors they had none, except two
an monks, who were wont to come up and
portion of the evening in converse with them.
. had completed his calculations, Biot had
to France, and war had broken out betwixt
nations. A. was now held to be a spy; his
ere interrupted; and with great difficulty he
d in making his escape to Majorca, where
tarily imprisoned himself in the citadel
r, near Palma. At last he obtained his
n condition of proceeding to Algiers, which
but was captured, on his return to France,
anish cruiser, and sent to the hulks at

He was, however, liberated after a time,
d once more for France; but almost as he
ring the port of Marseille, a tempest arose
ove the vessel across the Mediterranean all
to Algiers. The former dey, to whose
he had owed his liberation from the hulks,
l; his successor, a ferocious tyrant, placed
is of slaves, and intended to employ him
ers. After some time, he was released at
of the French consul, and, narrowly
another capture by an English frigate,
und his way to Marseille in July 1809. As
l for his suffering in the cause of science, the
y of Sciences suspended its standing rules in
ur; and though only twenty-three years of
ras elected member in the place of Lalande,
just died, and was appointed Professor of
al Mathematics in the Polytechnic School.
rds, his attention was devoted more to
ty, magnetism, galvanism, and the polarisa-
light. In 1811, he read a paper to the
e, which may be considered the foundation
tic polarisation.' In 1812, he commenced
ordinary course of lectures on astronomy,
as fascinated all Paris – the savans, by their
rigour and solidity; the many, by their
y of style. In 1816, along with Gay
A. established the *Annales de Chimie
Physique*, and confirmed the truth of the
ry theory of light. In the same year he
England for the first time, and made the
ance of various persons distinguished in
especially Dr Thomas Young. In 1818
his *Recueil d'Observations géodésiques,
siques, et physiques*. In 1820, he turned his
d inventive genius into a new channel, and
veral important discoveries in electro-
m. Oersted had shown that a magnetic
ras deflected by a voltaic current passing
wire. A. pursued the investigation, and
at not only a magnetic needle, but even non-
substances, such as rods of iron or steel,
subject to deflection also, exhibiting, during
n of the voltaic current, a positive magnetic
hich, however, ceased with the cessation of
nt. Some time after, he demonstrated that
copper, and other non-magnetic metals,
ved circularly, exert a noticeable influence
agnetic needle. For this discovery of the
ent of magnetism by rotation, he obtained,
the Copley Medal of the Royal Society of
; and in 1834, when he again visited Great
especial honours were paid to him by the
f science in Edinburgh and Glasgow. Four
vious to this second visit to Great Britain,
ceived the honour he most coveted – that of
ade Perpetual Secretary of the Academy.
while holding this office that he wrote his
loges of deceased members, the beauty of
as given him so high a place among French
s

prose-writers. As a politician, also, his career was remarkable. He was a keen republican, and took a prominent part in the July revolution (1830). In the following year he was elected by Perpignan as member of the Chamber of Deputies, where he occupied a position on the extreme left. In the February revolution of 1848, he was chosen a member of the provisional government, and appointed minister of war and marine. In this position he resisted the proposed measures of the Socialist party, regarding the constitution of the United States as the beau-ideal of democracy. His popularity in his own province was the means of preventing the discontented population of the East Pyrenees from proceeding to lawless and violent measures. On the question of the presidency, A. opposed Louis Napoleon, declared himself against the policy of the new ministry, and refused to take the oath of allegiance after the *coup d'état* of 1852. The emperor, in a letter, paid a high eulogium on his talents and virtues, and made a special exception in his case. A. died October 3, 1853. In his general character A. was sociable, energetic, and fond of fame. He was the intimate friend of Alexander von Humboldt.

ARAGO, JACQUES ÉTIENNE VICTOR, brother of the great savant, was born in 1790. In 1817 he accompanied the expedition, under Freycinet, in a voyage round the world. Afterwards, we find him engaged, first at Bourdeaux, and then at Toulouse, in several branches of light literature, industriously writing, in company with other scribes, a multitude of vaudevilles, besides publishing several poems and romances. In the year 1835, he undertook the management of the theatre at Rouen; but having become afflicted with blindness, he was compelled to resign this post in 1837. To his early voyage round the world, we owe two very pleasant books of travel: *Promenade autour du Monde* (Paris, 1838); *Souvenir d'un aveugle, Voyage autour du Monde* (Paris, 1838). In 1849, though deprived of sight, he formed a company of speculators; placed himself at the head of it, and departed for California, to search for gold on a large scale. His companions mutinied, and left him, deserted and disappointed, at Valparaiso. On his return, he published his painful experiences, under the title, *Voyage d'un aveugle en Californie et dans les Regions aurifères* (Paris, 1851). He died, January 1, 1855. A., ÉTIENNE, another brother of the astronomer, was born 1802, and is well known in France as a popular *feuilletonist* in the *Siècle*, and other journals. He held an appointment under the provisional government, as director-general of the post-office, in which he displayed great vigour, promptitude, and sense, and achieved several postal reforms; was elected member of the National Assembly; was compromised by the insurrection in June, and sentenced to exile for life. In 1859 he returned to France; and at the time of the Franco-Prussian war was mayor of Paris – an office which he resigned in November 1870. A. JEAN, another of the brothers A., born 1789, died 1836, was general of the republican army in Mexico, and wrote, in Spanish, a history of Mexico.

A'RAGON, a province in the north-east of Spain, situated between 40° 2 and 42° 54′ N. lat., and long. 2° 10′ W., and 0° 45′ E. Greatest length from north to south, 190 miles; breadth, 130. Area, 14,710 square miles. Pop. (1870) 928,718. It is bounded, N. by the Pyrenees, separating it from France; W., by Navarre, and Old and New Castile; S., by Valencia, and part of New Castile; and E., by Catalonia, and part of Valencia. The river Ebro, which descends from the northern heights of Old Castile, flows through the middle of A.

in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees, and from the Sierras in the south; of the former, the principal are—the Noguera, which forms the boundary-line between Aragon and Catalonia, the Essera, and the Gallega; of the latter, the principal are—the Guadalope, the San Martin, and the Salon. The province is naturally divided into the level country, along the Ebro, and the northern mountainous district of Upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines (*barancos*). Agriculture is here confined to the raising of maize, vines, and olives; but on the sides of the Ebro, where water abounds, rice and other grains are abundantly produced; and in the valleys of Upper A., which are at once the most beautiful and fertile of all the Pyrenean valleys, we find a splendid vegetation, and a soil that enables the inhabitants, in spite of the wretchedness of their agriculture, to grow considerable quantities of wheat, rye, maize, barley, &c. The climate of the province is various; comparatively cool in the mountain-districts, but often very sultry on the plains. Spurs of the Pyrenees strike down into the province a long way. It is between these ridges that the rich valleys lie, some of them upwards of 20 miles long. The slopes of the hills are clothed with forests of oak, beech, and pine, and the felled timber is floated down the rivers into the Ebro, and thence down to Tortosa at its mouth. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The manufactures are inconsiderable. A., peopled by a brave, active, enduring, but obstinate race, has frequently been the arena of sanguinary warfare. It early became a Roman province; and, on the fall of the Empire, passed into the hands of the West-Goths, but was conquered by the Moors in the beginning of the 8th c. The rulers of A., after it had been recovered from the Moors, and united with Catalonia (1137), became powerful; obtained possession of the Balearic Isles in 1213, of Sicily in 1282, of Sardinia in 1326, and of Naples in 1440. By the marriage of Ferdinand with Isabella, heiress of Castile, in 1469, the two states of A. and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. In the war with the French, 1808—9, Saragossa, the capital of A., was remarkable for its heroic defence under Palafox; and in recent Spanish wars, the people of A. have displayed the same courage which marked their conduct on that memorable occasion. Upper A. was on the side of the queen; but lower A. generally adhered to the party of Don Carlos. The province is now divided into three departments—Saragossa, Teruel, and Huesca. The chief towns are Saragossa, Calatayud, Huesca, and Teruel. See SARAGOSSA, &c.

ARAGUAY', a large river of Brazil, rising in S. lat. 18° 10' and W. long. 51° 30'. Like most of the considerable rivers of the country, it flows towards the N. After a course of about 1000 miles to San Joao, it there joins the Tocantins, which again, after a northerly course of 300 miles more, mingles its estuary with that of the Amazon round the Isle of Marajo. Like most of the rivers in this part of Brazil, the A. is of difficult navigation, being frequently interrupted by rapids.

ARAL, LAKE, next to the Caspian Sea, from which it is separated by the plateau of Ust-Urt, is the largest lake in the steppes of Asia. It lies in Independent Tatary, between 43° 42 and 46° 44' N. lat., and 58° 18' and 61° 46' E. long. It is fed by the river Sir (the ancient Jaxartes) on the N.E. side, and the Amu (or ancient Oxus) on the S.E. It is shallow, and has no ou[tlet] 117 feet above that of the Caspian, [and] that of the Black Sea. Like other [lakes] drained only by evaporation, it is brackish to the shallowness of its waters, navigation i[s] cult; but Russian steamers have been [on] it, and took part in the operations again[st] June 1873. The history of the Sea of A[ral] remarkable. Sir Henry Rawlinson and Yule have recently collected references [in] Greek, Latin, Arabic, and Persian writ[ers] established the fact that the area it [now] has been dry land twice within historica[l] Jaxartes and the Oxus then run [into] Sea of Aral to the Caspian. This [was] the Greco-Roman period, and again [in] and 14th centuries after Christ. Sir [H.] linson, in his address to the Royal G[eo.] Society in 1872, stated that the rest[oration] Oxus to its old bed was then under the sideration of the Russian governmen[t]. *ceedings of Royal Geographical Society*, No. 3, and vol. xvi. No. 4.

ARALIA, a genus of plants, the type of natural order *Araliaceæ*. This order is d[i]donous or exogenous, and consists of t[rees] and herbaceous plants, resembling the [Umbelliferæ] (q. v.) both in their general habit botanical characters, but differing [in] fruit, which is not *didymous* or form[s] separable carpels as in the *Umbelliferæ*. of the Araliaceæ consists of several one-[seeded] and is often succulent. The order con[tains] 160 known species, natives of tropical and cold climates, generally possessing and aromatic properties. Poisonous qual[ities] developed as in the *Umbelliferæ*. The many species affords good food for cattle are used for human food. The genus Ar[alia] tains a considerable number of species—[trees] and herbaceous plants. It has a [fruit] with 5 or 10 cells, crowned with t[he] *nudicaulis* is a native of the United a species of humble growth, having a [single] leaf with a trifid stalk and ovate ser[rate] the scape is shorter than the leaf. [The] to be equal in value to sarsaparilla [as a] and tonic. *A. racemosa*, *A. spinosa*, and *A.* also natives of North America, produce [a] gum resin. *A. spinosa* is a stimulant The berries, infused in wine or spirits, [are] in America as a cure for rheuma[tism] times called Toothache-tree: it [is] of Angelica-tree. It is a native [of] Virginia and Carolina, growing to [a] 12 feet, with a single stem, spreading [at] and trebly pinnate leaves and ovate [leaflets] very ornamental in a lawn. *A. polaris*, [a] southern island of New Zealand, and [in] abundance and luxuriance in Lord Islands, is described by Dr Hooker as a nificent plant,' a herbace[ous] 4-with large orbicular ma[ny]-flowers, presenting a very [peculiar] *edulis*, now called *Dimorphan[thus]* in China as a sudorific. Its [root] and pleasant when boiled; and [they] have an agreeable aromatic flavour. Japanese as carrots or parsnips Aralias abound in the warm valleys [of] The natives collect the leaves of mas[ses] cattle, for which purpose they are of country where grass for pasture is [in] use of this food gives a peculi[ar] Chinese rice paper has been cylinders of the pith of an [Aralia]

a species of Panax, is one of the most products of the order *Araliaceæ*. The roots of *Gunnera scabra*, or Panke, are ing, but its fleshy leaf-stalks are eaten e of rhubarb. It has been seen on the cliffs of Chiloe with leaves nearly eight meter, each plant with four or five of these leaves. It has been introduced into Britain, and to succeed well in the climate of Edin- The only representatives of this order in the flora are the Ivy (q. v.), and a small plant Tuberous Moschatel (*Adoxa moschatel-*

EVGENE, was born in 1704 at Ramsgill, e. His father was a gardener, and could keep A. at school only for a short time; while assisting his father, he contrived his passion for learning. At an early his life he married, and became a ster, first in Netherdale, and afterwards reborough, where he continued to reside . In the town of Knaresborough lived Clarke, a shoemaker, and an intimate e of A.'s. On one occasion Clarke to purchase a quantity of valuable goods, easily obtained on credit; but to the of everybody, he soon after disappeared, and of him could be discovered. Suspicion n A., not as Clarke's murderer, but as his e in swindling the public. His garden ched, and in it was found a portion of the h Clarke had purchased. A. was arrested , but acquitted for want of evidence. He his wife at Knaresborough, and went to and other parts of England, in his capacity master; and in spite of his nomadic mode ntrived to acquire a knowledge of botany, , Chaldee, Arabic, Welsh, and Irish, and ming a great etymological work, to be 'A Comparative Lexicon of the English, rock, Hebrew, and Celtic languages,' when suddenly dragged away from his ushership Academy, in Norfolk, and committed to a charge of murder.

ircumstances of the remaining portion of the s pretty well known. In 1759, a skeleton up near Knaresborough, which the inhabit- pected to be that of Clarke, for they had me to the conclusion that the unfortunate l met with foul-play, especially as A.'s wife several occasions, made strange statements ffect that her husband and a man named an, knew more of Clarke's disappearance y chose to admit. Houseman was now con- with a bone of the skeleton which had been nd. He very emphatically denied that it ke's. People naturally wondered how he so positive, the bones of skeletons being, to ated eye, so similar in appearance. They convinced that if the skeleton was not , Houseman must know where the latter t last he confessed that he had been a spec- the murder of Clarke by A. and one Terry. d the place where the body had been It was searched, the buried skeleton was and A. was tried at York, for the murder of on the 3d August 1759. What has given so linary an *éclat* to this trial, is the fact that acted his own defence. He attacked, with s, plausibility, and curious erudition, of circumstantial evidence; but to no — verdict of guilty was returned, and he nd ed to be executed three days after- the interval, he confessed his guilt to n who attended him. While in the — cell, he wrote a defence of suicide; but failed in a practical illustration of the doctrine, which he forthwith attempted.

ARAMÆ'A (from the Hebrew word *Aram*, signifying the highland in opposition to the lowland of Canaan) includes the whole of the country situated to the north-east of Palestine. Its boundaries, though not rigorously defined, were as follows: N., by Mount Taurus; E., by the Tigris; S., by Arabia; and W., by Arabia, Phœnicia, and Lebanon. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. *The Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the west Aramaic or Syriac, and the east Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. Ever since the Babylonian captivity, the pure Hebrew, in which the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, had gradually given place to the Aramaic. The Aramaic version of the Bible was that used in Christ's time, who quotes from it, and not from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeats on the Cross. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements. The Aramaic dialect is, in general, the harshest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out, and given place to the Arabic and Persian. Indeed, it is only found living among some tribes in remote districts of the mountains of Kurdistan, and in two or three villages in Syria; yet it is considered highly probable that it is the root of the whole cluster of Semitic tongues.

ARANDA, PEDRO PABLO ABARCA DE BOLEA, COUNT OF, born in 1718 of a distinguished Aragonese family, at first embraced a military career; but having evinced a remarkable spirit of observation, he was appointed by Charles III. ambassador to the court of Augustus III., king of Poland; which post he filled for seven years. After his return, he was appointed captain-general of Valencia, and in 1766 recalled to Madrid on account of its disturbed state, and the presidency of the Council of Castile was bestowed on him. A. not only soon restored order in the capital, but limited the power of the Inquisition, procured the expulsion of the Jesuits from Spain, and carried the salutary terror of government into the recesses of the Sierra Morena, then infested by hordes of ferocious banditti. Like many other reformers, he was not able fully to carry out his liberal intentions. In 1773, he was removed from his high position through the influence of the clergy, the Dominican monks especially, and sent as ambassador to France. Grimaldi succeeded him in his office, and after him Count Florida Blanca; but when the latter lost his office in consequence of court intrigues, A. returned to his position; soon, however, to lose it again through the agency of Godoy, Duke of Alcudia, the queen's favourite. He, however, still remained President of the Council of State, which he had organised; but upon his expressing his views regarding the war with France, he was banished to his native province of Aragon, where he died in 1799.

ARANEA AND ARANE'IDÆ. See SPIDER.

ARANJUEZ (a corruption of the Latin *Ara-Jovis*, altar of Jupiter), a town in the province of Toledo, Spain. It is situated on the left bank of the Tagus, 28 miles south south-east from Madrid, in a beautifully wooded valley, and is now connected with the Spanish metropolis by a railway. The town is built in the Dutch style, has broad and regular streets intersecting each other at right angles, and a

population of 3800. It is famed for its palace and gardens. The former was long a favourite resort in spring of the royal family, during which period A. occasionally reckoned as many as 20,000 inhabitants; the latter were laid out by Philip II., who built a palace also, for there was only a shooting villa here during his father's time, but a fire destroyed a portion of it, and more was taken down by Philip V., who reconstructed the edifice in French style. The present château was completed by Charles IV. On account of its gardens, the natives call A. 'the metropolis of Flora.' These gardens are interspersed with numerous summer-houses, the most celebrated of which is the *Casa del Labrador*, or Labourer's Cottage; but their most splendid ornament are the great elm-trees brought from England by Philip II., which thrive magnificently. They radiate out from a central plot in twelve distinct rows. A. is known historically for the treaty of alliance concluded here between France and Spain on the 12th of April 1772, and as the scene of the abdication of Charles IV. on the 18th of March 1808.

ARANY, JANOS, next to Petöfi the most distinguished of modern Hungarian poets, was born at Nagy-Szalonta in 1819. His father was a poor peasant, who spared no pains to get him into the church. In 1832, he entered the college at Debreczin, where he distinguished himself by his diligence; but unable to restrain his love of adventure, he joined, in 1836, a company of strolling-players, with whom he travelled about for several months, till driven by necessity and an upbraiding conscience, he hurried home to do what he could for the support of a now blind and aged parent. For some time he was engaged as a Latin tutor; but in 1840 he was appointed notary at Szalonta. He now married, and devoted his whole time to his profession. When the Kisfaludy Society of Pesth offered a prize for the best humorous poem, A. sent in, anonymously, his *Az elveszett Alkotmány* (The Lost Constitution of the Past). He was successful. Thus emboldened, he ventured, in 1847, to forward to the same society the first part of a Trilogy, *Toldi*. Struck by the beauty of this purely national effort, the members published it at their own expense, and again rewarded the author. A. soon became a popular favourite. His reputation penetrated even into the lowest ranks of the community. In 1848 appeared his *Murány Ostroma* (Conquest of Murány), which, however, received less attention owing to the political excitement of the time. The poet himself took a slight part in the revolution, but after the dismal termination of the war, he was allowed to return to his country. Since then he has published a narrative poem, *Katalin* ('Catherine'), Pesth, 1850. Besides which numerous stray pieces have appeared in the magazines. Some of his works have been translated into German.

ARAPAI'MA, a genus of fresh-water fishes, the largest known fresh-water fishes in the world. They are found in the rivers of South America, and are sometimes taken in the Rio Negro 15 feet in length, and of the weight of 4 cwt. They are taken with the harpoon, and are highly esteemed for food, both fresh and salted. In the salted state, they have begun to form an article of commerce, and are conveyed in large quantities to Para. The genus *A.* belongs to the family of *Clupesocidæ*, a family of malacopterous fishes, allied to the *Clupeidæ* or herring family, and is remarkable for the mosaic work of strong, bony, compound scales with which the body is covered. About six species are known.

A'RARAT (Airarat, in the old Armenian dialect; i.e., the plains of the Aryans), the ancient name of the fertile plateau through which flow Aras or Araxes. It occupies the mountainous region of Armenia, be Turkey and partly to Russia. Not passage in Genesis viii. 4, where it ... ark rested 'on the mountains of Ararat' become common to give the name A. to entire range, but to the mountain calle Armenians Massis Leusar—i. e., 'mountain ark' (known among the Turks as Agh 'steep mountain;' and among the Persians Nûh, 'Noah's mountain'). It rises in tw cones, known as the Greater and the Less the former, which attains the height of above the level of the sea, is covered snow. It is the highest elevation of and since the war of 1827 it where the Russian, Turkish, and Pe meet. In 1840 the form of the partially changed by a frightful ear earthquake. the proud distinction of being the only
the New World that has never received the
yoke. From the days of Pizarro and
ownwards, it has uniformly vindicated its
its wars of independence having lasted,
vals of precarious truce, from 1537 to
early as 1568, the Araucanians, taking a
a their enemy, brought into the field some
of cavalry; and in the war between Chili
some Araucanian youths of the first rank
officers in the republican armies.

CARIA, a genus of plants of the natural
iferæ (q. v.) or Pines, consisting of lofty
es of the southern hemisphere, and
ed by having the male and female flowers
te plants, the pollen of the male flowers
in 10—20 cases pendent from the apex of
the female flowers two under each scale;
ng one ovule. The species are all ever-
leaves broader than in pines and firs,
rever, the trees resemble in their general
growth. *A. imbricata*, sometimes called
the CHILI PINE, a native of the Andes of Chili,
forming forests on their western declivities, attains
a height of 150 feet, the trunk quite straight and free

End of a branch, much reduced, shewing the mode of ramification, and the manner in which the leaves are imbricated.

from knots. The bark of the young trees is studded
with leaves from the base upwards, even until 12
or 15 years of age. The branches are in whorls of
6, 7, or 8. Young trees have branches almost from
the ground; old trees have tall naked stems, with a
crown of branches. The female strobile (cone) is
roundish ovate, 8—10 inches in diameter, the scales
terminated by a long awl-shaped point, the seeds
wedge-shaped, and more than an inch in length. The

Araucaria imbricata:
Sketched in the Botanic Gardens, Edinburgh.

outer and inner bark of full-grown trees are each
4—6 inches in thickness; the outer bark of a cork-
like texture; the inner, fungous and porous. From
both outer and inner bark, and indeed from all parts
of the tree, resin flows readily and in great abund-
ance. The leaves are lanceolate, about 1½ inch in
length, and ¼ inch in breadth near the base, sharp-

pointed. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a smell like frankincense, and a not unpleasant taste. It is applied as a plaster to contusions. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. It is eaten raw, boiled, or roasted. A spirituous liquor is also distilled from it. A single strobile sometimes contains between 200 and 300 seeds, and one tree may be seen loaded with 20 or 30 of these great strobiles. This Araucaria was introduced into Britain in the end of last century, and is now pretty frequently planted. It promises to add a new feature to British landscapes, as other trees of the same order, particularly the larch and spruce, have done before, and will probably prove important in an economical point of view. It is the only species which seems suited to the climate of Britain. *A. Brasiliana*, the BRAZIL PINE, has loosely imbricated lanceolate leaves, and a looser and more spreading habit than *A. imbricata*. The seeds or nuts are sold as an article of food in Rio Janeiro. The resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, now called *Eutassa excelsa* (and by some *Altingia*), the NORFOLK ISLAND PINE, a native of Norfolk Island, New Caledonia, &c., attains a height of 160—220 feet, free from branches to 80—100 feet, and with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. The leaves of the young trees are linear and spreading; those of the adult are ovate, and closely imbricated. The strobiles are ovate, 4—5 inches in length. *A. Cunninghamii*, now also ranked in the new genus *Eutassa* or *Altingia*, the MORETON BAY PINE, a native of the shores of Moreton Bay and banks of the Brisbane River in New South Wales, very much resembles the last. It attains a height of 60—130 feet, and a diameter of 4—8 feet. The leaves of the adult trees are lanceolate and imbricated. The wood is yellowish, and is used for boat-building, house-carpentry, and the common kinds of furniture. The large seeds of *A. Bidwillii* are used for food by the natives at Moreton Bay.

Certain fossil *Coniferæ* found in carboniferous sandstone have received the name *Araucarites*. Livingstone found a forest of large silicified trees near the Zambesi, which Mr Quekett, on examination of specimens, ascertained to be 'silicified coniferous wood of the Araucarian type.' Fossil trees of the same type occur in the carboniferous strata of Britain. A trunk, for instance, 47 feet long, was found in Craigleith Quarry, near Edinburgh, in 1830.

ARAUJO, D'AZEVE'DO ANTO'NIO, afterwards Count da Barca, was born at Sá, in the neighbourhood of Ponte de Lima, in Portugal, on the 14th of May 1754. At the age of 11, he was sent to Oporto to study under his uncle, who held a high military command there. In 1787 he was appointed Portuguese ambassador to the Hague. Before entering on his duties, he visited England, where he omitted no opportunity of obtaining a knowledge of English manufactures, commerce, politics, &c. He next proceeded to Paris, where he similarly employed himself. Soon after his arrival at the Hague, he found himself entangled in political difficulties. The French Revolution had broken out, but the part which he played in the complication of political affairs which ensued falls to be treated more properly under the History of Portugal (q. v.).

At length he threw up his ambassadorship, and travelled through Germany, enlarging the sphere of his studies. He paid especial attention to mineralogy and chemistry, and was fortunate enough to become acquainted with Go
Herder, &c. After the Pea

owever clearly illegal, cannot be made
a valid reference. But where trans-
n parties have been brought to a close
award, apparently good, the courts
have refused to re-open them on a suggestion that some illegal item has been admitted in account.

There are certain matters which are specially referred to A. by statute. Besides those we have already alluded to, the following matters are all referrible to A.: Questions relating to the expenses of prisoners, under the 5 Geo. IV. c. 85; to the regulation of municipal corporations in England and Wales, under the 5 and 6 Will. IV. c. 76; to the laws concerning prisons, under the 5 and 6 Vict. c. 98; to disputes between masters and workmen, under the 5 Geo. IV. c. 96, amended by the 7 Will. IV. and 1 Vict. c. 67; to the laws relating to savings' banks, under the 9 Geo. IV. c. 92, and 7 and 8 Vict. c. 83; to the land rights and other possessions of certain ecclesiastical and collegiate corporations, under the 2 and 3 Will. IV. c. 80; to the management and improvement of episcopal and capitular estates in England, under the 17 and 18 Vict. c. 116; to the conveyance of mails by railways, under the 1 and 2 Vict. c. 98; to insolvents and to insolvency, bankruptcy, and execution, under the 1 and 2 Vict. c. 110, 7 and 8 Vict. c. 96, 12 and 13 Vict. c. 106; to the constitution of companies incorporated for carrying on public undertakings, under the 8 and 9 Vict. c. 16; to the taking of lands for undertakings of a public nature, under 8 and 9 Vict. c. 18; to the metropolitan sewers, under the 11 and 12 Vict. c. 112 (continued and amended by 12 and 13 Vict. c. 93, the 14 and 15 Vict. c. 75, the 15 and 16 Vict. c. 64, the 16 and 17 Vict. c. 125, the 17 and 18 Vict. c. 111); to friendly societies, under the 17 and 18 Vict. c. 56, and the 18 and 19 Vict. c. 93.

Under these acts of parliament, the class of cases which may, or which must, be referred to A., have been greatly enlarged. The railway acts, in particular, have largely contributed to this kind of amicable determination, although the parties in such cases cannot be said to have much discretion in the matter. Under the provisions, again, of the Common Law Procedure Act, 1854 (17 and 18 Vict. c. 125, ss. 3 and 6), parties may be compelled by the court, or judge who tries the case, to refer matters of mere account in an action which cannot be conveniently tried in the ordinary way.

Among the questions that cannot be referred to A., are matters arising out of the administration of the criminal law in the case of felonies and relating to agreements or transactions against public policy. Felonies and offences of a public nature cannot be referred, because the public safety and good require them to be punished, and for this purpose they can only be properly tried in one of the ordinary courts of the country.

With respect to matters which cannot be referred on account of their being against public policy, the rule is so obviously just as not to need illustration.

But there are certain misdemeanours which may be either settled by agreement or by means of an A., on a principle of very general application stated by Chief-justice Gibbs that where there is a remedy, by action as well as by indictment, a reference of the matter in controversy is good. And in these cases of misdemeanour, a compromise or settlement under a reference may be made, even after conviction, but with the sanction of the court.

As to the parties who may make a reference to A., it may be stated generally, that every one capable of making a disposition of his property or release of his rights may make a submission to an award, and in this category may be placed a married woman, who has a separate estate settled to her separate use, and there are even cases where a reference between a husband and wife has been held valid; and of course a husband may submit to A. differences

respecting his wife's personal estate which has not been settled to her separate use.

Respecting the powers of infants or persons under age to submit to A., there are numerous decisions in the courts of law and equity: but they go upon refinements and nice distinctions more suited for the professional lawyer than for the ordinary reader, and we therefore do not think it necessary to give any explanation of them in a popular article such as this professes to be.

Partners and corporations may make references to A. on the principles already explained, and according to the relation in which they stand to the matter in dispute.

Those who cannot submit to A. are persons in the following position: Persons who cannot contract; married women without any estate settled to their separate use; and along with them, as laid down in old ante-reformation books, persons professed in religion, and persons under duress. There is an exception to the incapacity of married women to refer to A. where the husband, by exile, banishment, or other cause, is held to be civilly dead, and when he is an alien enemy. To these exceptions it may be added, that in suits respecting the property of charities the Court of Chancery will not permit a reference, however advisable such a course may seem, unless the attorney-general gives his consent.

It has generally been the opinion of the legal profession, and held to be the doctrine of the courts, that a reference by the consent of counsel in a cause is binding on his client; and Lord Chancellor Eldon once said, that it was for the counsel to consider whether he was authorised to refer, and if so, he (the chancellor) would act on the consent so given; and the right and privilege of counsel to make a reference has been very strongly laid down in the Scotch courts. But a very recent case in the Court of Common Pleas (Swinfen *v.* Swinfen), where a compromise by counsel was successfully resisted by the client, has very much unsettled the English law on this subject; and now the feeling of the Bar in England is, that it is unwise to refer or compromise a litigation on the independent authority of counsel.

Submissions to reference may also be made by executors and administrators, by trustees, by the committee of a lunatic, and by the officer of a public company, who is authorised by a statute to sue and be sued in the name of the company. And there are persons especially empowered to refer by the statutes which we have already enumerated.

Disputes may be referred to A. in any manner that expresses the agreement or understanding of the parties to be bound by the decision of the arbitrator; and for this purpose no formal submission, either verbal or written, is necessary; but the arrangement must be such as manifestly to shew an intention to have the difference concluded by a private adjudication in the nature of an award. But where the submission is in writing, it must be executed in due form. A testator, however, cannot exclude his will from litigation by a proviso, that all differences respecting it shall be referred to A., although it is thought that the parties benefited by the will might themselves so refer. Generally speaking, it is advantageous to make the A. in such a form as that the award may be made a rule of court—that is, may be adopted by a court of law as its judgment on the matter submitted, a proceeding that affords an obvious facility in enforcing the award; and for this purpose it is necessary to make the procedure conformable to the directions of the statutes 9 and 10 Will. III., and 3 and 4 Will. IV., already referred to. Where the submission is merely verbal or constituted by a private bond or deed, it is liable to be capriciously revoked, and proceedings on the award, in such a case, can only be in the Court of Chancery.

The arbitrator ought to be a [illegible] perfectly indifferent between th[illegible] there are no other particular qu[illegible] office. And the choice by par[illegible] who they agree shall decide bet[illegible] fectly free. Some legal writers have [illegible] far as to maintain, that not only infants an[illegible] women, but even idiots and lunatics, can [illegible] tors, on the argument that every person is [illegible] to choose whom he likes best for his pr[illegible] and he cannot afterwards object to the [illegible] of those whom he has himself selected. [illegible] it is clear, is going too far, and the p[illegible] law would certainly be interposed [illegible] extreme cases. It is better to state [illegible] that on the condition that the [illegible] ordinary intelligence, the choice [illegible] absolutely unfettered. The only [illegible] rule is the case of a party who be[illegible] is the person pointed out [illegible] reference made by statute. [illegible] cated accounts, mercantile men ar[illegible] In other cases, it is usual to app[illegible] being accustomed to judicial investigation to estimate the evidence properly, to c[illegible] examination strictly to the points in qu[illegible] in making the award, to avoid those [illegible] respect of which it might afterwards be [illegible] Both time and expense are thus saved b[illegible] a professional arbitrator. It has [illegible] wisely remarked, that an arb[illegible] to arrive at his conclusions u[illegible] principles which would have a [illegible] which he is substituted—a [illegible] of obviously points to the expediency of [illegible] the referee. But an arbitrator is not [illegible] mere rules of practice which prevail i[illegible] courts of justice, and he has been h[illegible] allowing interest on both sides of an account, although such a determination [illegible] the practice of the Court of Chancery. [illegible] suit, which had been referred, had been

The proceedings before an arbitrator [illegible] according to the peculiar circumstances [illegible] submitted, but generally it is advisable t[illegible] them according to the forms observed [illegible] of law, and they usually are so co[illegible] the parties furnishes the arbitra[illegible] ment of his case, which is done [illegible] a copy of the briefs on each side; and [illegible] appointed he proceeds to hear them ([illegible] or by their counsel or attorneys), and [illegible] evidence on each side, nearly in the same [illegible] a judge at an ordinary trial. Having [illegible] case, the arbitrator proceeds to [illegible] which need not necessarily be [illegible] award is perfectly valid; but it [illegible] for the arbitrator to make his [illegible] stamped with the proper award [illegible] delivers to the successful party. [illegible] party gets a copy of the award on [illegible] This award in its effect operates [illegible] clusive judgment respecting all the [illegible] and it binds the rights of the parties.

An award may be set aside on [illegible] corruption and fraud in the arbitrator, [illegible] material irregularity or illegality appearing [illegible] face of the proceedings. But the [illegible] courts is to favour arbitrations and [illegible] unless such serious grounds as we [illegible] can be substantiated.

Where there are two arbitrators [illegible] often provides that in the event [illegible] in opinion the matter referred shall be

erson, called an umpire, who is generally ed under a power to that effect, by the arbi- ers. But they cannot make such an specially authorised so to do by submission. This umpire rehears and for this purpose is invested with the ers as those possessed by the arbitrators, l by the same rules.

Scotland an A. takes place in virtue of a submission executed by the parties in favour chosen referee, who there is called an arbiter, of arbitrator, as in England; and his award l a decree-arbitral. This submission is in the a regular deed, and is said to be general or according to the nature of the matters sub- by it. the submission specifying all the parti- reference, and the name of the referee powers and duties, which, in the ordi- are of the most comprehensive character cification of the time within which the decree-arbitral is to be made—a clause the parties to perform the award under a penalty; and other anxious provisions, are all carefully specified in the submission. n then proceeds before the arbiter, generally ng to the forms observed in the ordinary courts; and the arbiter makes his award in a mmn manner, the decree-arbitral commencing recital of the submission and of all the pro- —and after stating that the arbiter has ripely d the whole matter, and has 'God and a cience before his eyes,' it gives the arbiter's , and among other things ordains the sub- ad decree to be recorded according to the registration in the former, and the extract registry so made forms a judgment which put in execution by either party against the The decree-arbitral, like the submission must be executed and attested in the form of ar deed. Where there are two arbiters, the usually provides, that in the event of g in opinion, they shall name an umpire n, as he is called in Scotland, whose final.

lusion, and as a remark on A. generally, it ins to be stated, that of course, from the the case, there can be no appeal on the of the dispute submitted to any public l whatever.

BOGA, an ancient city in Sweden, in the of Westmannland, on a small river of the by which, with the aid of a canal, the ar and Malar are united. A. used to be at commercial town, but it has now sunk ificance, and only possesses an historical om the antiquities in its neighbourhood. its churches, cloisters, and chapels there only main the town and parish churches, the with an altar-piece of Rembrandt's. Several of the family of Vasa have resided here. assemblies were held here in 1396, 1412, 423, and 1474; diets in 1435, 1440, 1471, nd 1561, in which last year also certain known as the Arboga Articles, were passed ch Eric XIV. was enabled to limit the power nobles; and in 1625, Gustavus Adolphus an edict here, commanding that the copper the realm should contain its full worth of

ARBORESCENT (from Lat. *arbor*, a tree), a passed to plants to signify that they possess altogether, or in some measure, the character s. Even the dwarf willows and birches, on fines of polar or alpine perpetual snow, are ed as the A. vegetation of these regions.

ARBORICU'LTURE (from Lat. *arbor*, a tree), a term literally signifying the cultivation of trees, but in use generally restricted to the planting and management of timber trees, or employed as exclusive at least of the cultivation of fruit trees, which is a branch of horticulture or gardening.

The ancients practised A. to some extent, but chiefly with the view of beautifying their villas, or of forming public walks in the vicinity of cities. It is only for similar purposes, and on a very limited scale, that A. is yet anywhere practised in America. The planting of timber trees for economical purposes, or with a view to profit, is unnecessary whilst natural forests are abundant, and can scarcely be referred even in Britain to an earlier period than the beginning of the 16th c., nor did it become at all general till a much later date. The early forest laws of England, as of other feudal countries, had reference chiefly to game, for the sake of which it was, and in order to the enjoyment of the chase, that large tracts were depopulated and converted into *forests* by the first Norman kings. Plantations for timber and fuel were, however, certainly made in England in the 16th c.; and the importance of the subject was urged on public attention by authors of that period. In the 17th c., the greatly increased demand for oak, for the building both of ships and of houses, gave a new impulse to A., which attracted more than ever before the attention both of the government and of the great landowners; the publication of Evelyn's *Sylva* also did more than any previous work to promote a taste for it. It was in this century that nurseries for forest trees were first established. It was not until the beginning of the 18th c. that the first extensive plantations were made in Scotland, nor until towards the end of that century that A. became general in that country or in Ireland. How much the very landscape has been changed by it—how great a difference has been made by the conversion of bleak hills and barren wastes into woods—how much the scene has been changed by the new forms of foreign trees, some of which are now in many districts more abundant than those which are indigenous, it is not easy to imagine; and how much these changes have promoted and are indicative of improvements in agriculture and increased productiveness of fields, is equally difficult to estimate.

The A. of France, Germany, and other parts of Europe, to this day, consists in a great measure of the management of natural forests; and in the more eastern parts of the continent this is almost exclusively the case. Without a careful management of the natural forests, many districts of France and Germany would soon be destitute of fuel; by means of it an increased supply of valuable timber is also obtained; and extensive domains belonging to the state, or to private proprietors, are rendered much more productive. It is in Germany that the management of the forests has received the greatest attention, and has been most systematically and scientifically conducted.

The forest trees of Britain, and of temperate climates generally, are conveniently divided into two classes—the one consisting of coniferous trees or pines and firs (*Nadelholz*, i.e., the 'needlewood' of the Germans), the other including all other kinds (*Laubholz*, i.e., the 'leaf-wood' of the Germans); the latter being sometimes subdivided into *hard-wooded trees*, of which the most important in Britain are oak, ash, elm, beech, birch, hornbeam, sycamore, walnut, and chestnut; and *soft-wooded trees*, as willow, poplar, lime, alder, and horse chestnut. Of these and other trees, of their particular uses, and of the soils and situations to which they are adapted, notice is taken in separate articles.

Plantations are generally formed in Britain by

means of trees raised from seed in a nursery; but sometimes also by sowing the seed on the ground intended for the plantation; in which case, if circumstances permit, a crop of grain is often sown along with the seeds of the trees, as these do not in general vegetate very soon; and the young plants derive advantage from the absence of choking weeds when the grain-crop is reaped, and from the protection afforded by the stubble. It has been supposed by some, but there is no sufficient evidence in support of the opinion, that more healthy and vigorous trees are obtained by sowing on the spot than by planting those which have been raised in a nursery. However, only very young trees can be planted with advantage, those which have attained a greater size requiring a degree of attention far beyond what is possible in plantations even of very moderate extent. The time of planting is from November to February. The most approved mode of planting is in small pits, in which the roots are disposed in a natural manner, and which are then carefully filled up with earth; but it is often thought sufficient when the tree to be planted is very young, to make a slit for it with the spade, or two slits, one at right angles to the other in the form of the letter T. Other methods are also adopted, particularly for rocky situations, in which the spade cannot be used. Economy is often a consideration of great importance in determining the mode of planting.

The formation of plantations by the sowing of seed has been more generally practised on the continent than in Britain. In this way the vacancies in the natural forests of France and Germany are filled up. In this way also great sandy tracts have been covered with wood on the coasts of Pomerania and of France. This has particularly been accomplished on a scale of extraordinary magnitude in the downs of drifting sand, between the rivers Adour and Gironde. The operations there were begun by M. Bremontier in 1789, and deserve to be mentioned as perhaps the most important operations in A. that have ever been performed in the world. Vast forests of pinaster now occupy what was originally loose sand destitute of vegetation.

Too little attention has hitherto been generally paid to the adaptation of the kinds of trees that are planted to the soil and climate; and to this cause many failures in A. are to be ascribed. Some trees grow well even in exposed situations, and are fit to be employed in these, either to form entire plantations, or to occupy the outer part, and so to shelter other trees, which in general are not planted until the outer zone or belt of the most hardy kinds is somewhat advanced; some succeed only in rich soils; some are incapable of enduring the sea-breeze; others, as the sycamore, the elder, and the pinaster, are comparatively unaffected by it. Some trees suffer from an amount of moisture from which alders or willows would rather derive advantage; but, in general, the thorough drainage of the land intended for a plantation is one of the circumstances most important to its success.

To the necessity of this thorough drainage we must look as compensating, or more than compensating, the influence which woods exercise in condensing the moisture of the atmosphere, and in rendering a climate cold and damp; marshy soils being in this respect still worse. The shelter afforded by plantations judiciously disposed, whether in belts or otherwise, is also of great importance in rendering them suitable for that improved agriculture in which thorough drainage is of the first necessity, and which is always productive of amelioration of climate. The influence of plantations is therefore, upon the whole, beneficial, although vast masses of

forest are injurious to climate; and it is admitted that in some localities the planting has been carried to excess, so that fields often particularly in autumn, from want of free tion of air, and the landscape is often rest very narrow limits. The remedy in s obvious; and it not unfrequently within a short distance new plants formed with every prospect of benefi

Much has been written about the pru forest trees, with a view especially to the tion of taller and straighter stems; and cons difference of opinion exists as to the extent t pruning should be practised. It is, howev generally delayed till the branches to be r have attained too great a size, and is rudely performed, to the spoiling of rather than to the improvement of it. tice of leaving *snags*, instead of cutting clean off, has particularly bad effects. firs, from their manner of growth, need less than trees of other kinds. When tre been planted, not merely for profit but for this ought to be remembered in pruning, however, is too often intrusted to persons devoid of taste; and trees which, as they n grew, were very beautiful, are so treated w and saw that they become deformities ins adorning the scene.

In forming plantations, different kinds of t very generally mixed, although masses of on cular kind are also frequently planted. It however, to plant along with those wh destined most permanently to occupy the trees of other kinds as *nurses*, to be g removed as the plantation advances in growt this purpose, spruce and larch are more g employed than any other tree; althou Sc and birch are also deemed suitable for tions. The removal of some of these the first returns of profit from the pl is afterwards thinned from time to ti far more frequently suffer from being little, than from being thinned too much. of proper thinning is to be in part ascribed of many of those narrow belts of *planting* w common in Scotland, and which having been i for shelter, very imperfectly serve their seem to have suffered from the hardest selves. The thinning of a plantation allowed to grow too thick, must, how gradually performed, that it may be bene not injurious. After a sudden thinni tion sometimes ceases to thrive, and m often laid prostrate by the next storm; accommodate themselves both in their ro branches to the situations in which they grow

A considerable number of years must elapse any pecuniary return is derived fr a pla yet this mode of employing soils is fou the most remunerative of which even without reference to the cent lands to which shelter affords. increased demand for timber in Britain, of railways and other purposes, tends to further encouragement of A.

The resinous products of pine-woods are sidered as a source of profit in Britain; but turpentine, and resin obtained from them i parts of Europe, form articles of e great pinaster plantations already sands between the Adour and G products of this kind in large quantity. ment of trees for ornamental purposes much to A. as to Landscape Gardening, transplanting (q. v.) of large trees is only pr

ntal purposes. Hedgerow trees are planted for ornament, although sometimes they may seful shelter; but where this is not the case, n seldom be reckoned profitable, as they are s to crops. Copse or coppice-wood differs so both in its uses and in the mode of its manfrom other plantations, that it must be ected in a separate article.

BOR VITÆ (*Thuja*), a genus of plants of the order *Coniferæ*, allied to the cypress, and of evergreen trees and shrubs with com- flattened branchlets small, scale-like, ted leaves—and monœcious flowers, which celled anthers, and the scales of the strobiles es) with two upright ovules.—The common

Arbor Vitæ (*Thuja occidentalis*).

T. occidentalis) is a native of North Amecially between lat. 45 and lat. 49, but has en well known in Europe. It is a tree of feet high; its branches are horizontally ed and the strobiles (cones) small and oblo- young leafy twigs have a balsamic smell, hey and the wood were formerly in great e a medicine; the oil obtained by distillaom the twigs, which has a pungent and r-like taste, has been recently recommended rmifuge. The wood of the stem is reddish, d very light, but compact, tough, and durable, exposure to the weather remarkably well. e is very common in Britain, but planted s an ornamental tree, and seldom attaining a size as in its native country. It delights moist situations.—The CHINESE A. V. (*T.* a), a native of China and Japan, which is tely distinguishable from the former species ight branches and larger, almost globose gh strobiles, is also in Britain, and upon the t of Europe, a common ornament of pleasure- ; but it does not attain so great a size as the g, and is more sensible of the cold of severe

The balsamic smell is very agreeable. yields a resin, having a pleasant odour, to gh medicinal virtues were formerly ascribed; he remarkable name, *Arbor Vitæ* (Latin, signifree of Life), given to this species, and extended rens. Other species are known, but they are ortant than these. In its native country, this also attains the size of a considerable tree,— are several other species of *Thuja*, some of seem well suited to the open air in the climate of Britain, and others require the protection of greenhouses. Amongst the former are *T. plicata*, from Nootka Sound; and *T. dolabrata*, a native of Japan, a tree of great height and thickness, and which will not improbably prove the most important of the whole genus.—A tree, common in North America, and there known by the name of WHITE CEDAR, is sometimes included in the genus *Thuja*, under the name of *T. sphæroidea*, but is more generally ranked in the genus *Cupressus* as *C. thyoides*. See CYPRESS. The timber is highly esteemed, and an infusion of the scrapings is sometimes used as a stomachic.—Closely allied to the genus *Thuja* is *Callitris*. See SANDARACH.

ARBROATH, ABERBROTHWICK, or ABERBROTHOCK, a seaport town in the east of Forfarshire, situated at the mouth of a stream called the Brothock. Here King William the Lion founded a Tyronensian abbey in honour of Thomas-à-Becket in 1178. The king was interred in it in 1214. In the abbey, Bruce and the Scottish nobles met in 1320, to resist the claims of Edward II. to Scotland. Cardinal Beaton was the last of its abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the Reformers in 1560. Its ruins—which are cruciform, 270 by 160 feet—are very picturesque, presenting lofty towers, columns, Gothic windows, and a fine circular east window, 'the Round O of A.' The chief industries of A. are flax-spinning, jute-spinning, and the manufacture of sail-cloth. The new harbour, begun in 1841, admits vessels of 400 tons at spring-tides; it is protected by a breakwater. In 1872 the number of vessels belonging to the port was 68; tonnage, 10,021. The chief exports are grain, potatoes, fish, pork, and pavement, chiefly from Lower Devonian quarries 8 or 10 miles inland. A. is a royal burgh, and in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to parliament. Population in 1871 of parliamentary burgh, 19,973. A. is supposed to be the Fairport of *The Antiquary*, and the Redhead Crags and Coves form some of the scenes in that novel. The famous Bell-rock Light-house stands in the sea, 12 miles south-east of Arbroath.

ARBUTHNOT, JOHN, a distinguished writer and physician, the contemporary and friend of Pope and Swift, was the son of a Scottish episcopal clergyman, and born at Arbuthnot, in Kincardineshire, shortly after the Restoration. He studied medicine at Aberdeen, where he took his degree. A.'s father was obliged to resign his charge at the revolution. His sons' prospects being thus blighted in their own country, they were under the necessity of going abroad to seek their fortune. John removed soon after to London, and there supported himself by teaching mathematics. In 1697 he published an examination of Dr Woodward's account of the Deluge, which brought him into notice as a person of no common ability. Accident called him into attendance on Prince George of Denmark, who thenceforth patronised him. In 1709 he was appointed physician to the queen, and in 1710 was elected a member of the Royal College of Physicians. On the death of Queen Anne, in 1714, he lost his situation, and his circumstances were never so prosperous afterwards. In 1717, A., along with Pope, gave assistance to Gay in a farce, entitled *Three Hours after Marriage*, which, however, in spite of having the aid of a trio of wits, proved a complete failure. In 1723 he was chosen second censor of the Royal College of Physicians; in 1727 he was made an Elect; and had the honour to pronounce the Harveian oration for the year. He died

at Hampstead, in 1735. A. was one of the leaders in that circle of wits which adorned the reign of Queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He assisted Swift and Pope in the composition of that brilliant satire, the *Memoirs of Martinus Scriblerus*, contributing those portions of it which refer to science and philosophy; and he was undoubtedly the author of the celebrated political *jeu d'esprit*, the *History of John Bull*, which has so often been imitated. Besides several medical essays, he published *Tables of Greek, Roman, and Jewish Measures, Weights, and Coins* (London, 1705—1708), a work which was long the best authority on the subject. There is also a philosophical poem of his composition in Dodsley's Miscellanies, entitled *Know Thyself*.

ARBUTUS, a genus of plants of the natural order *Ericeæ*, containing a number of species, small trees and shrubs, the greater part of which are American. The fruit is fleshy, 5-celled, many-seeded, usually dotted with little projections, whence that of some species has a sort of resemblance to strawberries; the corolla is urn-shaped.—*A. Unedo*, the

Arbutus Unedo.

STRAWBERRY TREE, is a native of the south of Europe, found also in Asia and America, and in one locality in the British Isles, the Lakes of Killarney, where its fine foliage adds much to the charm of the scenery. It requires protection in winter in the climate of Paris. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20 - 30 feet, but is rather a great bush than a tree. The bark is rugged; the leaves oblongo-lanceolate, smooth and shining, bluntly serrated; the flowers nodding, large, greenish white; the fruit globose, of a scarlet colour, with a vapid sweetish taste. It is, however, sometimes eaten. Of late, excellent alcohol has been made from it in Italy. A wine is made from it in Corsica, which, however, is narcotic, if taken in considerable quantity, as the fruit itself is, if eaten too freely. The bark and leaves are astringent.—*A. Andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *A. integrifolia*, are eaten in Greece and the east. But all the species seem to possess narcotic qualities in greater or less degree; the fruit of *A. furens*, a small shrub, a native of Chili, so much as to cause delirium.- *A. aculeata*, which abounds at Cape Horn and on Staten Island, is an elegant and most pleasing evergreen, very much resembling the myrtle. It grows to the height of 3 or 4 feet, and produces small white flowers, followed by a profusion of red shining berries, which ornament the bush during winter. Their flavour is insipid, but some [illegible] Mixed with a few raisins, they have voyagers into tolerable tarts.—*A. Uva ursi* generally called *Arctostaphylos Uva ursi* BEARBERRY, is a small trailing ev common in the Highlands of Sc Hebrides, and indeed in the n Europe, Siberia, and North Amer dry, heathy, and rocky places. The flowers small crowded terminal racemes, of a beau colour. The berries are austere and mea are said to form a principal part of the food in northern regions. Grouse also feed o The dried leaves are used as an astringent m medicine, and as such have a place in the copœias, being principally employed in affections of the bladder; but those of *Vitis Idæa* are often fraudulently substituted them.—The BLACK BEARBERRY (*A.* or *Arcto alpina*) is also a native of the northern par globe, a small trailing shrub, with black about the size of a aloe, relished by having a peculiar taste, which to others is able. The plant is found on many of the mountains of Scotland.

ARC (Lat. *arcus*, a bow) is any part of line. The straight line joining the ends of its *chord*, which is always less than the Arcs of circles are *similar* when they subten angles at the centres of their respective if similar arcs belong to equal circles, th selves are *equal*. The le of an A. is if the angle which it su circle is known, and circumference. Let the whole ci and the angle of an A. 50°, the ar

S, a Greek philosopher, founder emy, was born at Pitane in Æolia, B.C. He studied philosophy, first us the Peripatetic, and afterwards After the death of Crantor, A. master of the Academic party, or the doctrines of Plato; but he introanges that its philosophic character ranged. His great rivals were the Stoics, whose opinions he attacked, but he does not appear to have attained any certainty in his own convictions. He had studied under too many masters, and discussed too many different systems, to be sure of the truth of any. He denied the Stoical doctrine of a 'convincing conception,' which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, and recommended abstinence from all dogmatic judgments. In practice he maintained that we must act on grounds of probability. It is not easy to determine satisfactorily what his moral character was. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he has yet been accused by his enemies of the grossest profligacy; and whatever extravagance there may be in such an extreme charge, it is tolerably certain that he died of a debauch in his 76th year (241 B.C.). Nevertheless, his adversary Cleanthes, the Stoic, passed this high eulogium on him: 'The morality which A. abolishes in his words, he re-establishes in his actions.'

ARCH, an arrangement of bricks, stones, or other materials over an open space, by which they are made not only to support each other by mutual pressure, but to sustain a superincumbent weight. We have the excellent authority of Sir G. Wilkinson for stating that the A. was known to, and used by, the ancient Egyptians; and that the Assyrians were acquainted with its principles is placed beyond doubt by the arched gateways so frequently represented in their bass-reliefs. The A. is generally supposed to have been unknown to the Greeks—a supposition which becomes very improbable if we hold it to be proved that it was used by nations with whose works they must have been familiar. But that the Greeks did not employ it generally in their architectural structures, is certain; and as it is not less certain that the Romans did, it is to the latter people that the nations of modern Europe are indebted for their acquaintance with its great utility. The introduction of the A. by the Romans eventually effected a complete revolution in the architectural forms which they borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, as the Romanesque passed into the Gothic style, it was superseded by the segments of a circle, placed generally more or less in a perpendicular direction. In its earliest application by the Romans, the A. did not spring from the entablature of the columns, but was generally placed behind them, and rested upon separate imposts. Subsequently, this arrangement was departed from, and the A. assumed the position which it has since retained above the columns; sometimes having an entablature interposed, and sometimes rising directly from the capital of the column or pier, as in the Romanesque. Before mentioning very briefly the different forms of the A., it seems natural to refer to a very simple structure, frequently met with in those early edifices in our own country which we are in the habit of designating as Saxon. It consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. The mechanical principles on which the A. depends, though here very imperfectly employed, seem sufficiently called into play to suggest their more extensive application; and it is not impossible that out of this rude construction the A., in its later and more elaborate forms, might have developed itself amongst ourselves without hints from foreign sources.

Of the A. itself, the following variations of form

may be enumerated: The semicircle (1), the segment (2), the ellipse (3), which were the only forms employed by the ancients, and which alone were known in medieval architecture up to the time at

which the pointed A. was introduced. Of these, the stilted A. (4), and the horseshoe A. (5), are modifications, in both of which the centre or point from which the A. is described is above the line of the impost, but in the former of which the mouldings are continued downwards vertically; whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe A. belongs peculiarly to Arabian architecture (q. v.), not only from its having originated simultaneously with the faith of the Prophet, but from its continuing to be used exclusively by his followers. Next, in point of time, though far surpassing all the others in beauty and variety, is the pointed A., the origin of which is still a subject of antiquarian controversy. The greater or less acuteness of the pointed A. depends on the position of the two centre points from which its curved sides are described. Its various proportions will be better understood from the accompanying diagrams (6, 7, 8, 9) than from any verbal description.

y confined to the antiquities of
omans. About the middle of the
A., or the antiquities of the Dark
began to be cultivated. Egyptian
y,' as it is sometimes called, made
le progress until the discovery of
e, containing a bilingual and tri-
which enabled Young in 1819, and
821, to find a key to the hiero-
more recent discoveries of Botta,
on, and others, have already
n A. to a point beyond all expecta-
tion. Indian A. has been successfully prosecuted, especially during the last forty years, chiefly by officers of the East India Company. Something also has been done by them and others for Chinese A. Men of letters in the United States have devoted their time to the rude and scanty remains of the aboriginal inhabitants of North America. The A. of Central and South America, as it attracted attention much earlier, so its more stately and instructive monuments have much better rewarded such investigations as those of Lord Kingsborough, Messrs Stephens and Catterwood, and others.

The study of A. has been largely promoted by the publication, at the expense of the state, in various countries, of the national chronicles, charters, and records; by societies and clubs contributing to the same end, or printing essays on questions of A.; and by the establishment by the state, by associations, or by individuals, of museums for the collection and classification of antiquities. In England, a society for promoting the study of antiquity was founded so early as the year 1572. The irrational jealousy of the government dissolved it in 1604. It was revived in 1707, enlarged in 1717, and incorporated by royal charter in 1751, under the name of the 'Society of Antiquaries of London.' An attempt to institute a similar society in Scotland was made about 1700 by 'some honourable and knowing gentlemen,' who resolved to continue their conferences till a complete historical account be made of the nation. But it was not until 1780 that the Society of Antiquaries of Scotland was incorporated by royal charter. The Royal Irish Academy for promoting 'the study of science, polite literature, and antiquities,' was chartered in 1786. The Society of Antiquaries of Scotland, and the Royal Irish Academy, have good museums of national antiquities. The British Museum in London (established in 1753), besides a great collection of early manuscripts and printed books, has galleries of Assyrian, Egyptian, Etruscan, Greek, Roman, British, and Mediæval antiquities. One of the most remarkable collections of antiquities on the continent, is that of the Royal Society of Antiquaries of the North, at Copenhagen, arranged so as to illustrate a favourite theory of the Scandinavian archæologists that the primitive antiquities of a country may be assigned to three successive ages or periods of stone, bronze, and iron, with as much certainty and precision as the comparative antiquity of geological strata, or periods of the world's creation, may be determined by the fossils which they are found to contain. The museums of the Louvre and the Hôtel de Cluny, in Paris, contain fine collections of Assyrian, Egyptian, Greek, and Roman antiquities, and an unrivalled collection of Mediæval antiquities. The Royal Museum at Naples has gathered together the statues, paintings, vases, household utensils, and other objects recovered during the last hundred years from the ruins of Herculaneum and Pompeii. These long buried cities may be regarded as being in themselves museums of Roman A.

ARCHANGEL, the chief city in the Russian department of Archangel, is situated in lat. 64° 32' N., and long. 40° 33' E., about 40 miles above the junction of the river Dwina with the White Sea; is the seat of an archbishop, and contains 1867, 19,936 inhabitants. Its name is taken from the monastery of St Michael. A. is the chief commercial city for the north of Russia and Siberia, and is visited by numerous vessels—especially British—from July to September, the port being clear of ice only during that period. The houses are built chiefly of wood; and their general appearance is far from handsome. The finest edifices are the bazaar or mart, and the

marine hospital. A. has an ecclesiastical college with 9 professors, schools for engineering and navigation, &c. The chief articles of traffic are fish, train-oil, skins, furs, timber, wax, iron, tallow, bristles, caviare. The town, which is the oldest seaport of the empire and was for a long period the only one, was founded in 1584. Its merchants trade as far east as China, and have all the commerce of Siberia. During summer, A. has a continual market.

ARCHA'NGEL (from the Greek prefix *archi-* or *arch-*, denoting chief, and *angelos*, an angel), a term which occurs in the New Testament; and which, according to some, is there a title of our Saviour—but according to others, designates an angel superior in power and glory to the other angels. We read, in the Epistle of Jude, of 'Michael the A.', and in Rev. xii. 7, of 'Michael and his angels.' In 1 Thess. iv. 16, we are told that the coming of our Lord at the last day shall be 'with the voice of the A., and with the trump of God.' We nowhere read in the Holy Scriptures of *archangels*, although the plural is popularly as much used as the singular. The notion of an angelic hierarchy certainly prevailed among the Jews, the highest place being assigned to Michael; and the same notion has extensively prevailed in the Christian church. There are passages of Scripture which seem to indicate different degrees and classes among the angelic hosts, but no clear revelation has been made upon this subject. See ANGELS.

ARCHANGEL, NEW. See SITKA.

ARCHBI'SHOP (Gr. *arch-*, and *episcopos*, overseer) is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in the chief town of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original over the newly-appointed chief pastors. In the Oriental Church, the archbishops are still called 'metropolitans,' from the circumstance first mentioned. In the African Church, on the other hand, the term used was 'primus.' The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th c., the A. of Rome has assumed the name of Pope (papa). There is an official letter by Justinian, addressed to 'John, A. of Rome and Patriarch;' and several ecclesiastical constitutions are addressed to 'Epiphanius, A. of Constantinople and Patriarch.' The synod of Antioch, in 341, assigned to the A. the superintendence over all the bishopries, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the patriarchs (q. v.) towards the end of the 4th and during the 5th centuries, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation of indulgences, and the like. ' further enjoyed the honour of hav carried before them in their own archiep in presence of the pope himself, and of *pallium*. In England, there are two of whom the one has his seat at Ca capital of the ancient kingdom of Kent York, the capital of Northumb R. ruling over a province in both have enjoyed the the first, the A. of Canter not merely precedence as and the senior A., but as posse and universal authority over This pre-eminence is marked they respectively assume—the A. of Ca styled the Primate of all England (*et primus totius Angliæ*), whilst the A. simply called Primate of England (*primus politanus Angliæ*). It is also indicated b which they occupy in processions—the A bury, who has precedence of all the only preceding the A. of York, but Chancellor being interposed between th ous to the creation of an arch the authority of the A. of to that island. The amount belongs to an A. over the bishops o not very accurately defined; but introduces irregularities into his guilty of immorality, the A. may account, and even deprive him. In Armagh, who is primate of all Irela Bishop of Clogher on the latter gro A. of Canterbury belongs the honour the crown on the sovereign's head at his and the A. of York claims the like pri case of the Queen-consort, whose perpetu he is. There is an appeal to the Court of the Bishop, or in the case of an A. of an archbishopric, to the Court of Arches. See DEACON, DEAN, PRIEST. See also Cripps's *Law Relating to the Church and Clergy*. Edinburgh, 1857.

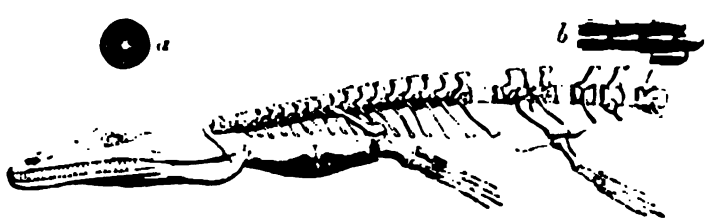
ARCHDU'KE. A. and Archduchess are titles now taken by all the sons and daughters of the Emperor of Austria, and by their descendants through the male line. The title of A. was gradually assumed by the dukes of Austria, as a mark of precedence over the other dukes of the empire. Duke Rudolph IV. of Austria, in 1359, called himself Palatinus Archidux, but he was not so styled by the emperor. His brothers, Albert and Leopold, did not assume the title after his death, though they had occasionally done so in his lifetime. The third son of Leopold, however, Ernest-the-Iron, revived it. Still he was addressed by the emperor simply as duke. At last the title was formally conferred on them by the Emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift. Still the usage was not uniform, for he afterwards speaks of himself as duke. The privilege was extended to the Tyrolian branch of the Austrian House in the person of Sigismund. The value of the dignity thus assumed was a cause of contention with Bavaria in 1589. The Austrian view was, that to duke it held the same relation that archbishop does to bishop. The dukes of Austria claimed to have always had precedence over the other ducal houses, and regarded the title as a mere indication of what had been universally acknowledged. Bavaria, on the other hand, relied on the greater antiquity of its dukedom. The contest was decided by the Emperor Rudolph II. in favour of Austria, the precedence of which has not since been called in question. Other dukedoms claimed the privilege of being so called, but it was invariably denied by the emperor.

ARCHEGOSAURUS, a remarkable fossil saurian reptile, so named by Goldfuss (*archegos*, leader;



Archegosaurus:
a, section of a tooth; *b*, scales.

s, lizard), as constituting the real begin- eptilian life, which had previously been l as not extending below the Permian ocks.

engraving, it will be seen that the head s protected by a firm dermal skeleton, of numerous plates, while the internal rtilage seems to have continued unossified. is flattened and triangular, with rounded e front one being somewhat lengthened. are simple cones, having a labyrinthic similar to that of the recent *Lepidosteus*. dral column remains in an embryonic ; the arches and peripheral elements of ra are ossified; but the *chorda dorsalis*, persistent, is unprotected below. The ort and almost straight, round and slender ldle, expanded and flattened at the ends. airs of limbs are nearly equal in size, and re very much resemble those of the *Proteus*. They have each four long, slender digits, which obviously supported a longish, narrow-pointed paddle, adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales, which have been preserved in some specimens.

Four species have been described.

The history of the A. is shortly this: Its remains, found in the Bavarian coal-measures, had been described as those of a fish under the name of Pygopterus Lucius (Agassiz). In 1844, H. von Meyer first described it under the name of *Apateon pedestris*. This specimen was found in the coal-measures of Münster-Appel, in Rhenish Bavaria, and was supposed by Meyer to be related to the salamanders, and yet not without considerable doubt; for he says, 'its head might be that of a fish, as well as that of a lizard, or of a batrachian.' In 1847, Goldfuss figured and described three distinct species discovered in large concretionary nodules of clay-ironstone, from the coal-field of Saarbrück,

giving to them the generic name of A. He considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Professor Owen has subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: It is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis*, and the branchial arches, and by the absence of the occipital condyle, or condyles, as in *Lepidosiren*, and by the presence of labyrinthic teeth, as in *Labyrinthodon*, which, however, also ally it to the ganoid *Lepidosteus*. There is thus in the A. a blending together of the characteristics of reptile and fish in one animal. It occupies a position between, and equally related to, the salamandroid-ganoid fishes on the one hand, and the labyrinthodont reptiles on the other, while the latter conduct us through the *Lepidosiren* to the perennibranchiate batrachia.

ARCHELAUS, one of the Heraclidæ, who, when driven by his brothers from his native land, fled to Macedon, where he became the founder of a powerful family, of which Alexander the Great was said to be a descendant.—ARCHELAUS, natural son of the Macedonian king, Perdiccas II., came to the throne (after he had murdered the rightful heir) in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. Euripides and Zeuxis frequented his court; and the palace of the monarch was splendidly adorned by the paintings of the latter. It is said that Socrates refused an invitation to proceed thither, having no great respect for the character of A., which was stained with odious vices. He is believed to have been murdered by Craterus, one of his favourites; but the story of his death is told differently.—A., a general under Mithridates the Great, was sent into Greece with a large fleet and an army of 120,000 men to oppose the Romans in 87 B.C. Sulla was sent against him, and besieged him in Piræus, whence A. moved to Bœotia, and here collected all his forces. A battle took place at Chæroncia, when victory declared for the Romans. A. now retreated to Chalcis, where he waited until Mithridates had despatched another army of 80,000 men into Greece. The second fight took place at Orchomenos, in Bœotia, and, after two days' contest, the whole host led by A. was totally routed by Sulla. A., after hiding for three days in a morass, escaped to Chalcis. After a treaty of peace had been effected between Sulla and Mithridates, A. fell under the displeasure of his monarch, being unjustly suspected of treason, and, fearing for his life, as also perhaps disgusted at the return he had received for his many services, he went over to the Romans at the outbreak of the second war, in 81 B.C. After this time, he appears no more in history.—A., son of the former, married Berenice, daughter of King Ptolemæus Auletes (56 B.C.), and ruled over Egypt for the short space of six months during the banishment of Ptolemæus. The usurper lost his life in a battle against Aulus Gabinius, proconsul of Syria. His grandson, also named A., obtained from Marcus Antonius the province of Cappadocia, and retained it during the reign of Augustus. Tiberius accused him of political innovations, and condemned him to death; but, as he was old and fatuous, his life was spared. He died soon after his trial, at Rome, in 17 A.D.—A., son of Herod, the tyrant of Judea, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne be by his brother Antipas, A. went to Rom authority was confirmed by August Ethnarch of Judæa, S ria, and a reign of nine years, h deno on account of his cruel t Vienna, in Gaul, where h were added to the Roman

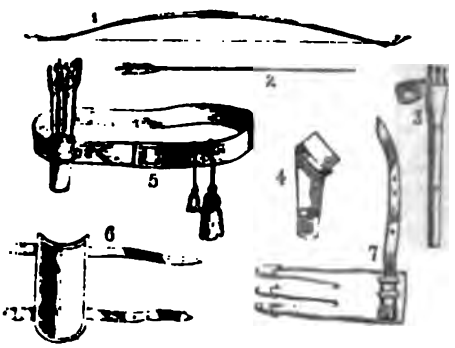
lt he bare ful thriftilie
dresse his takel yewmanlie,
ɔaped not with fetheres lowe,
ınd he bare a mighty bowe.'

rtial Discipline, by Ralph Smithe, of Queen Elizabeth, we have a ılish archer two centuries after Captens and officers should be noble weapon the long-bow; and diers, according to their draught good bowes, well nocked, well ynge whippe in their nocke, and ɔed with wax braser, and shut- re strynges trymed as aforesaid; ı of arrows, with a case of leather he rayne, and in the same four- ı, whereof eight of them should ı residue, to gall or astoyne the lshot of light arrowes before they the danger of their harquebus ıan have a brigandine or a little ll or hufkyn, a maule of leade gthe, and a pike, and the same e with a hook and a dagger.'

o Turks, the Persians, the Tatars, the east, as well as the Ameri- and arrow are still used as wea- ırope, they are nearly abandoned ı. The chief differences between eapon employed by the archers are noticed under ARBALEST;

ı are still included among the arbarous and semi-barbarous ıl, archery is now nothing more ıcouraged by archery clubs or ense, however, archery is expe- being healthful as an out-door o further useful. During the archery was much patronised ll Fields being the chief scene his reign, archery fell into t a century. In 1776, a Mr hery in the neighbourhood of shortly there were several toxo- societies formed. The system hen another period of inactivity till 1844. In this last-named revived in Yorkshire, and has nding every year. A recom- sport is that ladies can take of the few open-air pastimes be said. In the modern exer- here are several varieties of the antagonistic parties; but ı target-shooting. In archery- of prizes are generally awarded, ; for the greatest number of ny part of the target, and for ch to the exact centre. The spot in the centre, a red ring white ring, then a black, and outside of all a white ring bordered with green. The merit of the shooting consists in a near approach to the exact centre or 'gold.' Two targets are generally used in a match, on opposite sides of the field, each by one party. The apparatus mostly used at these archery meetings is represented in the



Archery Apparatus.

annexed cut. 1 is the bow, varying in weight according to the strength of the person who is to use it; 2 is the arrow; 3 is the quiver, a tin case for holding arrows not immediately in use; 4 and 5 are the pouch and belt for holding the arrows actually in use. The tassel of the belt serves to clean the arrows when dusty. 6 is the brace, buckled round the left arm, to protect it from being hurt by the string when shooting; 7 is the shooting-glove, formed to protect the three fingers used in drawing the string. Besides these articles and the target, archers are sometimes provided with a large case called an 'ascham,' fitted up with the neces- sary drawers and compartments for the reception of the bow, arrows, string, and other necessary accoutrements.

In archery competition, the total number and value of each person's hits are registered on a scoring-card. The shots are usually punctured on a card with a pin, as being preferable to pencil or ink marks; and the mode of ascertaining the value of the hits, which is increased in proportion as they reach the centre, will be seen by the following example:

FORM OF THE SCORING-CARD.

Names.	Gold.	Red.	Inner White.	Black.	Outer White.	Total.	Value.
A	..	....	....	.....	.....	35	68
			.	.....	.....		
					..		
B	.	..	.....	.....	.....	26	48
			...	.	....		

It appears by the card that A has two in the gold, four in the red, six in the inner white, ten in the black, and thirteen in the outer white, making a total of thirty-five. The real value of these is ascer- tained by multiplying the hits in the gold by nine; in the red, by three; in the inner white, by two; by adding a fourth to those in the black, and leaving without alteration the number in the outer white. By this process it will appear that A's numbers, according to the *value* of each circle, amount to 68, and B's to 48—hence A is the winner by 20. But A's *total* might have been less than B's, and still he might have been the winner, provided the shots had lain more towards the gold than B's.

As an instance of the skill which long and careful practice may insure, Mr Horace A. Ford, who has written an excellent work on Archery, on one occasion, out of 144 shots, made 143 hits—765 score; on another, 144 shots, 137 hits—809 score; and on another, 75 shots, 75 hits—555 score.

A'RCHIL, or O'RCHIL, is a colouring substance obtained from various species of lichens. The A. is not originally present in the lichens, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a powder with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added; when, by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-coloured matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. The lichens which yield the best A. in largest quantity, are *Roccella tinctoria* and *fuciformis*. The former is called the *Archil* plant, and is obtained in large amount from the Canaries and Cape de Verd Islands, and the Levant. Another lichen, *Lecanora tartarea*, collected from rocks in Sweden, is largely imported into Britain. It is sometimes called cudbear (q. v.), or cudbear lichen, and sometimes white Swedish moss. A. is soluble in water and in alcohol, to either of which it imparts a violet colour, with a good deal of a crimson hue. It is much employed in the dyeing of silks, where a beautiful lilac colour is required; but though a brilliant rich hue is imparted to the silken fabric, the colour is not a permanent one, being easily acted upon by the rays of the sun. Hence the A. is seldom used by itself, and the cloth is first dyed lilac by another colouring matter, and is then passed through an A. dye, which imparts a brilliant lilac hue to the cloth. A. is seldom employed to dye cotton cloth, but it is often used, along with indigo, in the dyeing of woollen cloth; and besides enabling the indigo colour to go much further, it imparts its peculiar rich tint to the blue or black cloth or yarn immersed in it; the colour, however, so obtained is not so permanent as where the A. is left out. Cudbear (q. v.) and Litmus (q. v.) are analogous to A., and are obtained from the same lichens.

The lichen distinguished by the name of the A. plant or lichen, *Roccella tinctoria*, grows very sparingly on the southern coasts of England, but abundantly on the shores of the Mediterranean and of the neighbouring parts of the Atlantic, where it often covers rocks near the sea, so as to form what has been likened to a sort of turf upon them. The Spanish name is *Orciglia*, from which the French *Orseille*, the English A. or Orchil, and even the botanical name *Roccella*, are derived. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner, of a grayish brown colour, with powdery warts (*soredia*); the *apothecia* (q. v.) orbicular, flat, horny, almost black, with a scarcely prominent border. That from the Canary Isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and about an inch and a half in length. A less branched and more slender, prostrate, or pendulous variety (*Roccella hypomecha* of Bory de St Vincent) is common at the Cape of Good Hope and in the island of Mauritius, and appears in commerce along with the other, but is of very inferior quality. A variety remarkable for its large size, or perhaps a distinct species (*R. flaccida*), is brought from Lima and other parts of the west coast of South America; it is sometimes as thick as a 6 or 8 inches long, and is of All these, and *Roccella fuciformis*, very receive in commerce, and from A. name of Orchella weed, the different kinds distinguished according to the countries from they are imported. They are also known Dyer's Moss.—*R. fuciformis* now of the A. or Orchella weed of *tinctoria*. It differs from *R. tinctoria* not rounded, but flat, and in habit very distinctly bordered. It grows in tions, and is also a native of E only in warmer climates, as on Madagascar, &c. That from Angola the very best quality.

Among the lichens from which A. is tured is the *Parelle d'Auvergne* or *Orsi* (Ground A.) of the French, *Roccella corallina*, which is gathered mountainous districts of other parts of the south article of export (with other Sweden to Holland. But the which A. of the finest quality can the species of *Roccella*, and the increase of the supply from different quarters from Angola, tend to diminish the demand lichens.

ARCHI'LOCHUS of Paros, in about 714—676 B.C., and is regarded the Greek lyric poets, although the origin is claimed for Callinus, a writer whose have slightly preceded that of A. Of life, especially of the calamities frequently given in his writings. was Telesicles, his mother was At an early age, becoming entangled tests, he abandoned his native town of the citizens to Thasos. While us in some extant verses, he lost his against the Thracians, yet not through Subsequently he was banished which he had gone, some say vindicated his conduct in running away others, because of the licentiousness He is said to have gained the Olympic Games by an ode in honour but this is doubtful. Having returned took part in the war which broke Naxos, in the course of which he in battle or by ion. pronounced a curse upon him novelty, and satirical lyric poems; so much so, that ness,' and 'Parian verse,' became ancient times. He scourged most merciless fashion, and most malicious skill in selecting the points on which they were most said that Lycambes, who had promised Neobule in marriage to A., promise, was so severely assailed to escape ridicule, both themselves. Among the Homer. They dedicated same day, and placed the statue Homer on the same bust. It is and with high probability, that been far more in A. than mere ve Even Plato, who was not likely admiration in such a case, c wise;' and Gorgias, the rhetorician have said, when Plato sent against the Soph 'A new A.' There

ME'DES, the most celebrated of ancient
cians, was born at Syracuse about 287
said to have been a kinsman of King Hiero,
does not seem to have held any public
devoted himself entirely to science. In
aathematics, we cannot estimate fully the
— without a more exact knowledge of the
science as he found it; we know, how-
he enriched it with discoveries of the
portance, on which modern mathemati-
founded their methods of measuring
aces and solids. Euclid only considers a
l figures in relation to one another, but
mparing them with rectilineal surfaces

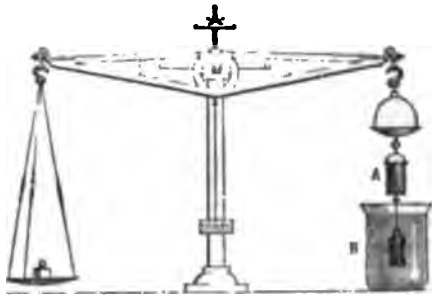
Eureka.) Practical mechanism seems to
an equally new science in the days of A.;
that if he had a fulcrum or stand-point,
ve the world, betrays the enthusiasm
the extraordinary effects of his newly
machines inspired him. Among the
inventions ascribed to A., is that of the
ew, and the *cochlea* or water-screw (see
SCREW), in which the water is made in
o ascend by its own gravity. During the
racuse by the Romans, he exerted all his
s the defence of the city. Polybius, Livy,
and Plutarch speak with astonishment of the
machines with which he opposed the attacks of the
enemy. But while giving detailed accounts of his
other contrivances, they say nothing of his having
set fire to the ships by means of mirrors, a story
which is not very probable in itself, and rests on
later narratives. When the Romans took the
city by surprise (212 B.C.), A., according to the
tradition, was sitting in the public square lost
in thought, with all sorts of geometrical figures
before him drawn in the sand. As a Roman soldier
rushed upon him, he called out to him not to
spoil the circle! But the rude warrior cut him down.
According to his own direction, a cylinder enclosing
a sphere was engraved upon his tombstone, in com-
memoration of his discovery of the relation between
these solids—a discovery on which he set particular
value. When Cicero was in Sicily as quæstor, he dis-
covered the tomb hid among briers. His collected
extant works were edited by Torelli (Oxf. 1792).
There is a French translation with notes by F.
Peyrard (Paris, 1808, 2 vols.), and one in German by
Nizze (Strals. 1824). The *Arenarius* was translated
into English by G. Anderson (Lond. 1784). The
object of the treatise is to prove that it is possible
to assign a number greater than that of the grains
of sand that would fill the sphere of the fixed stars,
the diameter of which A. assumes at a certain num-
ber of stadia. The difficulty lay in expressing such
a vast number by means of the clumsy notation of
Greek arithmetic, and the device by which the
difficulty is eluded is considered as affording a
striking instance of A.'s genius.

ARCHIMEDES, the PRINCIPLE OF, is one of the
most important in the science of Hydrostatics, and
is so called because the discovery of it is generally
ascribed to the Syracusan philosopher. It may be
thus stated: A body when immersed in a fluid loses
exactly as much of its weight as is equal to the weight
of the fluid it displaces; or: A fluid sustains as much
of the weight of a body immersed in it as is equal to
the weight of the fluid displaced by it. It is proved
experimentally in the following way. A delicate
balance is so arranged that two brass cylinders, A
and B, may be suspended from one of the scale-pans,



the one under the other. The lower cylinder, B, is
solid, or closed all round, and fits accurately into the
upper cylinder, A, which is hollow. When the two
cylinders are placed under the one scale, pan-weights
are placed upon the other until perfect equilibrium
is obtained. The cylinder B is now immersed in
water, and in consequence of the buoyant tendency
of the water exerted upon it, the equilibrium is
destroyed; but it may be completely restored by
filling the hollow cylinder, A, with water. The
amount of weight which B has lost by being placed
in the water, is thus found to be exactly the same as
the weight of a quantity of water equal to its own
bulk, or which is the same thing, to the quantity of

water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves, they swim on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely the same as they do. The pretty scientific toy called the Cartesian Diver is intended to illustrate this. Although the principle of Archimedes is generally established with reference to water, its application extends equally to bodies immersed in air or any other fluid.

ARCHIME'DES' SCREW (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Fig. 1 represents it in its simplest form. This consists of a

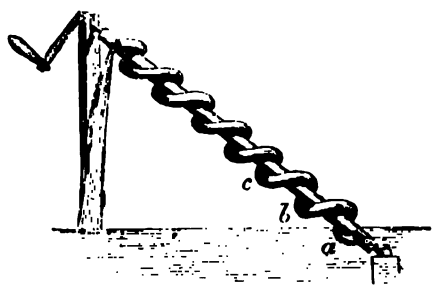


Fig. 1.

flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. In the position represented in the figure, the lowest bend (*a*) of the tube will be filled with water, and if now the handle be made to turn in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water enclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend, *b*. The first bend (*a*) has meanwhile received a second charge, which, after a second revolution, flows up into the second bend (*b*), and takes the place of the first charge, which has now moved up to the third bend, *c*. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen from the figure that there is room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is hollowed out into a double or triple threaded screw, and enclosed in a water-tight case, which turns round with it, the space between the threads supplying the place of such tubes in Fig. 1. Fig. 2 represents a double-thr of this description, with the case remove It is sometimes found convenient to fix

CTURE (Lat. *architectura*, from the
the chief fabricator, the architect), the
or constructing. In this country, A. is
l into Civil, Military, and Naval. In
ticle we shall confine ourselves to the
latter being treated of, the former
d of FORTIFICATION, the latter under
BUILDING. Civil A., when taken in
se, may be regarded either from an
entific, or a utilitarian point of view,
r, as a means of giving external form
expression to mental conceptions or
ideas, it is a branch of æsthetics, or of the fine arts properly so called (see ART), and takes rank with sculpture and painting; in the second case, it consists in a knowledge of certain laws of physical nature, and a consequent power of calling them into play, or counteracting their operation, and is consequently a branch of that wider department of science to which the name of *Mechanics* (q. v.) is given; whereas in the last it becomes a practical art, which has for its object the application of the principles, both artistic and scientific, which A. embraces, to the elevation of national and individual character, and the increase of the physical comfort and well-being of mankind. But though it admits of being thus analysed or separated in thought, it must not be imagined that A. can exhibit in practice any one of these principles to the exclusion of the others. The abstract conception of all-pervading deity, as embodied in the Greek temple—the religious aspiration after a personal god, as shadowed forth in the Gothic cathedral—can be realised only in accordance with the principles of mechanics, and the most rigorous adaptation of means to ends; whereas, in an opposite direction, the kraal of the Hottentot, the hut of the Indian in the American wilderness, or even the vulgar chimney-stalk in the dingy manufacturing suburb, if properly constructed for their respective purposes, will be found to have obeyed such æsthetical principles as they may have come in contact with. Nature is not self-contradictory; and art and science, beauty and utility, when rightly understood, are never in conflict. A celebrated German writer and thinker (F. Schlegel) has described A. as 'frozen music;' and the comparison is in accordance with the remarks which we have made; for music, though apparently the freest and most lawless, is in reality the most rigorously scientific of the arts. But though a strict adherence to all the principles of A. be indispensable to every genuine architectural structure, whatever be its object, it by no means follows that equal prominence must be given to each of these principles on every occasion. If a building has for its primary object the expression and commemoration of such feelings as grief, gratitude, devotion, or the like, this object manifestly will be best attained by subordinating the scientific and utilitarian to the æsthetic principles of A.; and the reverse will be the case where mere convenience, and also, though in a lesser degree, where convenience, in combination with beauty or magnificence, is sought. It is in a great measure by the prominence which they have given to one or other of these principles, that different nations have displayed their diversities of character in their A. The speculative and poetical character of the Greeks was exhibited in their temples, whilst their preference of the state to the individual appeared in the fact that these structures were designed for the worship of the protecting divinity of the city by the citizen, not for the worship of a personal god by the individual man. Amongst the Romans, again, terrestrial power and material aggrandisement were the exclusively national aspirations, and consequently their A. had their own honour and glory primarily in view. The basilicas, amphitheatres, and triumphal arches of the Romans were their own; but the temples which they raised in honour of the gods, were little else than imperfect copies from the Greek, with scarcely any assignable national characteristics. Then, when we come to mediæval times, though, on the revival of spiritual tendencies, æsthetic principles again become prominent, they exhibit themselves under totally different forms; and the distinctions between heathen and Christian thought could scarcely be more distinctly
words than they are exhibited to the

difference between a Greek temple and a Gothic cathedral. Even the relation which subsists between Christian and Mohammedan A. (Gothic A. and Arabian A., q. v.) strikingly reminds us of the fact that Mohammedanism was but a sort of bastard Christianity. Domestic life again appeared in full purity and vigour only in modern times; and then only do we see the utilitarian principles of A. finally prevailing over the æsthetic. But apart from the mental characteristics and tendencies of a people, there are many other circumstances which modify their A. Of these, one of the most important is climate. Arrangements for the permanent and commodious residence of the family within doors could not be expected to attain much perfection amongst a race like the Greeks, whose life was spent in the open air; and the climate of Holland, as well as the genius of the people and the character of their occupations, has had much to do with the fact that the Dutch have rarely risen above a town-house. Following thus the peculiarities of national character and circumstances, it is obvious that the more widely these differ in any two nations, the more dissimilar will be the styles of A. which they produce respectively. Moreover, it is apparent that the higher the stage of national development, the more marked will be the character which the A. of a people will assume. A. thus bears a strict analogy to language. Both are an expression of thought, and in the one and in the other, the richness, variety, and precision of the expression will be in proportion to the quantity and quality of the thought to be expressed. Lastly, in the fact that all genuine A. is the expression of the ruling national ideas and forms of thought of some one particular people, we perceive the reason why a building compounded of several styles should be characterless and unpleasing; and why this should be more and more the case, the more characteristic the styles compounded, and the greater the equality preserved amongst them. The Doric pillar in itself, and still more, perhaps, the Roman adaptation of it, is the simplest and most rudimentary of all pillars; and what we are in the habit of calling Saxon, is the simplest and most rudimentary of all the styles of Gothic A.; and hence the introduction of a few Tuscan pillars considerably modified into a Saxon or Romanic church, does not awaken feelings of very decided repugnance, whereas an attempt to combine equally the beauties of the Parthenon and of Cologne Cathedral in the same building would be unspeakably revolting. The limits of the present article preclude us from presenting to the reader a consecutive account of the origin and development of the different styles of A. These will be treated under separate heads (see EGYPTIAN A., INDIAN A., GREEK A., GOTHIC A., ARABIAN A.; see also ARCH, PILLAR, ARCHITRAVE, &c.); and all that can be here attempted is to trace the earlier stages through which A. passed in the historical nations, before it reached the point at which it afforded the means of expressing the feelings or supplying the wants of mankind.

1. The earliest stage of monumental A. in every part of the world seems to have been that in which it supplied to the existing generation the means of setting a mark on the face of the earth, of a nature so ineffaceable as that it should continue to be visible to future generations. No attempt was yet made to tell a tale either by the form of the monument, or by any figure or inscription engraven on it. Apart from the tradition intended to accompany it, it was speechless—confessedly unintelligible. But it is easy to see how powerful would be the effect of such an erection in preserving that tradition from oblivion, and fixing it down to the particular locality; for so long as a conspicuous object existed, which obviously was the work of human hands, the cause of its existence would be a subject of curiosity, which could be gratified only by inquiries which must lead to a recital of the events intended to be commemorated. It was with this view that Joshua (xxiv. 26) took a stone, and set it up under an oak that was by the sanctuary of the Lord—'And said unto all the people: Behold, this stone shall be a witness unto us; for it hath heard all the words of the Lord.' To this primary class of monuments belong those tumuli or barrows, and conical heaps of stones called cairns, carns, or kearns, which, when they occur in Britain, we perhaps rightly ascribe to the Celtic portion of our forefathers, but which there is much reason to believe have been erected by every race at a certain stage of their progress. The b ow. it is true, is not wholly destitute of architect… Occasionally it contains a passage … leading to a square enclosure or … in which the remains of bones, and … drinking-cups, and other articles, som … Roman or Brito-Roman manufacture, &c. The barrows are always, however, of the and most inartificial construction, and in … ing them, we are only, as it were, on the threshold of architectural science.

2. The earliest class of erections to which title can with any propriety be given, which are commonly spoken of as Druidic… These consist generally of separate stones, enormous size, raised on their ends, sometim… circle, and at other times so as to enclose an … space, which in some cases is roofed in by h… tal slabs. These roofing-stones are frequen… such prodigious weight as to give rise to many … jectures regarding the mechanical means by which, and the mechanical knowledge of those by whom, they were placed in the positions in which we … them. These strange, and, to us, alm… unintelligible remains of antiquity, whe… extent, assume an air of savage and gloomy … Of this the most conspicuous instance … to be found is that of Stonehenge (q. v.), in … bury Plain in Wiltshire. Wherever a Celtic … lation existed, these monuments are to be … Druidical monuments are more common … than in England; and in France, as expected, they exist in the greatest n… variety in Brittany (q. v.), though not… approach the magnitude, or, in some r… the workmanship of Stonehenge. ARCHIVOLT, the ornamental band or moulding which runs round the lower part of the voussoirs of an arch.

ARCHON, the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q. v.), the Athenians, according to the traditionary account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title A. (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C., the time of office was limited to ten years; and in 714, the exclusive claims of Medon's family to the office of A. were abrogated, and it was thrown open to all persons of noble birth; afterwards to all citizens, without distinction of rank (477 B.C.). In 683, the office had been made annual, and the number of archons had been extended to nine. The year was named from the first A.; to the second, styled Basileus, belonged the care of religious affairs; the third was Polemarchos, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled Thesmothetæ, or lawgivers. Among the Jews, during the time of their subjection to the Romans, the title of A. had various meanings; but was generally given to the members of the Sanhedrim or supreme council. In the mystical jargon of the Gnostics, the term A. was frequently employed, and hence one of their sects, especially opposed to Judaism, received the name ARCHONTICS. See GNOSTICS.

ARCHYTAS of Tarentum, one of the most illustrious men of antiquity, flourished about the year 400 B.C. His father's name was Mnesagoras. A. is said to have been a contemporary of Plato, and on one occasion to have saved the life of the latter when the tyrant Dionysius wished to put him to death. His public career was glorious. He was seven times elected general of his city, though it was customary for the office to be held only for one year; and in every campaign which he undertook, he was victorious. His civil administration was equally fortunate. Affairs of the highest moment were repeatedly intrusted to him; and yet, though deeply skilled in philosophy and politics, he was possessed of a childlike simplicity of character. He was drowned on the Apulian coast. A.'s virtues were as conspicuous as his talents. He paid the most humane attention to the comfort and education of his slaves, and although one of the greatest geometricians, he did not disdain to make a rattle for the amusement of his children. He solved the problem of the doubling of the cube, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is generally supposed to have exerted a considerable influence on Plato, and some affirm that even the gigantic understanding of Aristotle was indebted to him for the idea of his categories. Only fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics.

ARCIS-SUR-AUBE, a small town in the French department of Aube, situated in lat. 48° 32′ N., long. 4° 8′ E., with (1872) 2781 inhabitants, is remarkable on account of the battle fought here, March 20, 21, 1814, between Napoleon and the

allied forces under Prince Schwartzenberg. The battle, beginning with several skirmishes on the first, and ending in a general engagement on the second day, when the French retreated over the Aube, was not in itself very important. But Napoleon now formed the plan of operating in the rear of the Allies, and left the road to Paris open; assuming that they would not venture to proceed without attempting first to secure their rear. The Allies marched, nevertheless, on the capital, and thus decided the campaign.

A'RCOLA, or A'RCOLÉ, a village on the left bank of the Adige, in northern Italy, 15 miles E.S.E. of Verona, famous for the victory gained by Bonaparte over the Austrians, 17th November 1796. The Austrians, relieved by the retreat of Moreau from the Rhine, had begun to take the offensive in Italy, and General Alvinzy appeared at the head of 50,000 men, with the main body of which he advanced to Caldiero, and threatened Verona. Bonaparte, recognising the danger, descended by night the course of the Adige, crossed that river at Ronco, and was thus in a position to threaten the left flank of Alvinzy's army, which was posted at A. A causeway leads from Ronco across the morasses to A., before reaching which, the road crosses the small stream of the Alpon by a narrow bridge. This bridge was defended by the Austrian general, Mittrowsky, with fourteen battalions of infantry, and two squadrons of cavalry. On the 14th of November, Augereau attacked the bridge with two battalions of grenadiers, but being exposed in flank to the Austrian fire, was obliged to withdraw. Bonaparte now seized the standard himself, and rushed on the bridge, followed by the grenadiers; but again the fire of the Austrians, who were in much greater force than the French, made it necessary to draw back. The struggle was renewed on the 16th, with a similar result; and it was only on the 17th that the French succeeded in getting possession of A., not, however, by forcing the bridge, but by sending a column across the Alpon, lower down, and getting in rear of the Austrians. On this Alvinzy was obliged to retreat to Vicenza. It fared no better with the other column of the Austrians under Davidovich. In this series of battles the Austrians lost 18,000 men killed, and 6000 prisoners. The French loss was 15,000.

ARÇON, JEAN CLAUDE D', a distinguished French engineer, born at Pontarlier, 1733, was originally intended for the church, but on manifesting a decided preference for the study of Vauban, his father, an eminent jurisconsult, consented to his choice of a military profession. In 1754, he entered the Military School at Mézières, and, in the following year, he passed as an engineer. During the Seven Years' War, he acquired considerable reputation, especially in the defence of Cassel. His fertility of invention was surprising, and of the greatest benefit to that branch of the service with which he was connected. In all his writings—which, in spite of a very faulty style, can be read with pleasure—there are indications of a lively, rich, and vigorous genius. He was even bold enough to question the wisdom of certain strategical propositions of the Great Frederick. But his most famous scheme was that by which he hoped to reduce Gibraltar, then in the hands of the English, and defended by Governor Elliot. He contrived floating batteries, incombustible, and not liable to sink, which, however, were not successful, though this is mainly to be attributed to the fact of his efforts being indifferently supported. When the French, under Dumouriez, overran Holland, A. took several strongly-fortified places, amongst others, Breda. After this, he retired from public life, and confined himself to the literature of his His most important work is, *Considéra taires et Politiques sur les Fortifications* (P In 1799, Bonaparte called him to the se died the year after.

But if essential characteristics o outweigh mere position, they must her to the A. O. than to the Atlantic. all fed by currents from the A. O., erborean in temperature. Even the of the three illustrates this. While is present, in general, more ice than r Baffin's Bay, Hudson's Bay itself cene of perhaps the two most abor- t disastrous, of all modern attempts scovery. On opposite sides of South- Lyons and Back were arrested by acks, the one near the Bay of God's other off Cape Comfort - the latter °, and the former being twice as of the Arctic Circle. Reckoning, he bottom of James's Bay, as an 's, the arctic seas, thus appended to er, reach as far south as the parallel

et known, at least accurately, of the very and exploration have developed ore skill and heroism than perhaps n and discovery of all the rest of e the age of Columbus. Without ything to be said on this subject arate heads of North-East Passage, assage, and Polar Voyages, it may not here to state summarily the compa- bours of the Russians while pushing their domestic rivers to survey their s. About a century and a quarter ovitch simultaneously sent forth five complete, if possible, the North-East n the White Sea to the Obi, four seasons were consumed; from the Obi to the Yenesei, four seasons; from the Yenesei to the Lena, season after season was spent in both directions without success; from the Lena to the Kolyma, six seasons were occupied; from the Kolyma to the Pacific every effort was fruitless, though the Cossack Deshneff was known to have accomplished this part of the enterprise about a century before.

Arctic navigation, in fact, is beset by almost every imaginable difficulty and danger. In addition to the peculiar perils of ice in all possible states, the adventurer, often blinded by fogs and snows, has to face, generally without guide or sea-room, the storms, tides, and currents of comparatively unknown waters. If such be his three months of summer, what must be his nine months of winter! Take a general illustration from the personal experience of the most successful of all the arctic navigators. On the parallel of 73, and under a temperature of 15° degrees below zero of Fah., Captain M'Clure spent the night of 30th October 1851 on the ice, amid prowling bears, and that without food or ammunition—his only guide being a pocket-compass, which, however, the darkness, thickened by mist and drift, rendered useless. The gallant officer whiled away the time by sleeping three hours on 'a famous bed of soft dry snow,' and by wandering 10 miles, by the crow's flight, over a surface so rugged as to endanger his limbs. It was at the close of a pedestrian expedition of nine days, on very short allowance of food and water, that the adventure took place; and it had been immediately occasioned by a generous desire of reaching the winter-quarters by a nearer cut, so as to have 'a warm meal ready for his men on their arrival.'

Notwithstanding the labours and researches of two centuries and a half, very little of this vast ocean has been even seen by man. To the north of the 83d parallel, in fact, the A. O., so far as authentic evidence goes, is a mere blank to geographers, for Parry, in 1827, barely reached lat. 82° 45'; Kane, in 1854, touched only 81° 22'; the *Polaris*, in 1871, reached only 82° 16'; and, in 1874, Weyprecht and Payer, the leaders of the Austro-Hungarian Polar Expedition, just reached 82° 5', though they saw a lofty promontory as far north as 83°. At all the intermediate points of longitude, the northern limit of geographical knowledge falls short, more or less at every point, of the parallel of 83°. Perhaps the actual average of such northern limit, even on the full tale of 360° of long., may not exceed lat. 75°, so as to leave absolutely unknown a circle of 30° of lat., or nearly 2100 miles in diameter- an area little inferior to that of Europe. This untrodden world, however, is not to be regarded as a continuous wilderness of ice. Parry, at his furthest point, found not an unbroken field, but separate floes, with more or less of open water between them - the mildness of the temperature being indicated by falls of rain; and Kane, again, at his furthest point, saw a free sea to the north, as far as the eye could reach, from a promontory 240 feet high; while, to use his own words, 'a gale from the north-east, of fifty-four hours in duration, brought a heavy swell from that quarter without disclosing any drift or other ice.' This is quite in keeping with the fact already noticed, that Hudson's Straits and Bay are often more encumbered with pack than the waters of far higher latitudes. With regard to currents, Parry, during nearly the whole of his boat sleigh expedition of 1827, found that his place by reckoning was considerably ahead of his place by observation, or, in other words, that his northward progress on the floes was neutralised more or less by the southward progress of the floes themselves, the existence of a current towards the south being thus shewn.

M'Clure derived advantage from the current, whether advancing through open water or drifting along at the mercy of the pack. The experience of Weyprecht and Payer was different from that of any preceding navigators, since they found that they steadily drifted *north*. While M'Clure had the fortune to return with the news of the discovery of the North-West Passage, M'Clintock has shewn that the discovery must have been anticipated by Sir John Franklin. Succeeding expeditions, of which a great number have been equipped by England, Germany, France, Sweden, America, Austria, and Denmark, have been mainly directed towards the North Pole. They have resulted in contradictory accounts regarding the supposed open polar sea; but seem to have established that Greenland is an island, or rather perhaps a group of islands overlaid and bound together by glacier ice.

Of the more southerly portion of the A. O., the only section that is tolerably well known to a distance from the continent is that which washes the north-east of America. It contains, under the collective name of Polar Archipelago, these islands, or parts of islands: Banks Land, Prince Albert Land, Wollaston Land, Victoria Land, Prince Patrick Island, Princess Royal Islands, Melville Island, Cornwallis Island, North Devon, Grinnell Land, North Lincoln, and various others. Off the coast of the Old World, again, are Spitzbergen, Nova Zembla, New Siberia, Wrangel Land, King Charles Land, &c. The latest discovery, made by Weyprecht and Payer in 1873, is that of Franz-Joseph Land, an extensive and mountainous tract, lying about 200 miles due north of Nova Zembla. Its south coast is in about 80° N. lat., and it was seen to extend as far north as 83°, occupying at least 15 degrees of longitude. The chief straits are Lancaster Sound, Barrow's Strait, Smith's Sound, Strait of the Fury and Hecla, Wellington Channel, Banks Strait, &c. The chief rivers, all of them on the mainland, are the Obi, the Yenesei, and the Lena, of the first class; the Mackenzie, the Yana, the Indigirka, and the Kolyma, of the second; and many others of the third.

The principal production of the A. O. has been the whale. The whale-fisheries on the west of Spitzbergen, and on both sides of Greenland, scarcely need to be mentioned. But it may not be generally known, that, according to official returns as quoted by Admiral Beechey, the Americans had, in two years, drawn more than 8,000,000 of dollars, or upwards of £1,600,000 sterling, from the whale-fishery of Behring Strait alone.

On the side of East Siberia, however, the A. O. produces a more remarkable article of traffic. Here are found, in the greatest abundance, the bones of the mammoth. Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, give up, as it were, their dead; while the islands lying off the Yana, and even the depths of the sea itself, literally teem with these mysterious memorials of antiquity.

The American half of the A. O., if it cannot boast of fossil ivory, presents something still more difficult perhaps to be explained. In lat. 74° 25′, and lat. 76° 15′ respectively, Captain M'Clure and Lieutenant Mecham discovered large deposits of trees, apparently indigenous, of considerable size. Writing of Banks' Island, M'Clure has the following passages: 'From the summit of these hills, which are 300 feet high, to their base, abundance of wood is to be found, and in many places layers of trees are visible, some protruding 12 or 14 feet, and so firm that several people may jump on them without their breaking: the largest trunk yet found measured 1 foot 7 inches in diameter'—equivalent in girth to about 5 feet. Again, 'I entered a ravine some miles inland, and found the north side of it, for a[bout] composed of one mass of wood. S[ome] fied, the remainder very rotten, [some] for burning.' Writing of Prince P[atrick] Mecham has the following passage: 'D[rift] buried in the east bank of the ravine, and ing about 8 feet, a tree of considerable [size] the afternoon I found several others of kind: circumference of first and second 3 feet; of another, 2 feet 10 inches. F[rom] fect state of the bark, and the distance [from] from the sea, there can be but little d[oubt] grew originally in this country. [It] through: it appeared very close-grained, [and] so immensely heavy that we could carry [but] of it away.'

morass exists on the south-east, and the per-
ar banks of Knaig Water, rising 50 feet
otect the camp on the west. The prætorium,
al's quarter, now called Chapel Hill, rises
he level of the camp, but is not exactly
entre, and is nearly a square of 60 feet each
hree of the four gates usual in Roman camps
seen. A subterranean passage is said to
merly extended from the prætorium under
of the Knaig. Not far north of this station,
ay to Crieff, may be traced three temporary
camps of different sizes. Portions of the
s of these camps still exist. A mile west of
immense cairn of stones lately existed, 182
; 45 feet broad at the base, and 30 feet in
eight. A human skeleton, 7 feet long, in a
fin, was found in it.

ARDROSSAN, a small seaport town and summer bathing-place in Ayrshire. It owes its rise to the public spirit of the Eglintoun family. Its harbour, which is sheltered by an island off the coast, is one of the safest and most accessible on the west coast of Scotland, and has been greatly improved, at vast expense, by the Earls of Eglintoun. There is a large export of coal from this place, and ship-building is carried on to a considerable extent. On a hill above the town stand the ruins of A. Castle, said to have been surprised by Wallace when held by the forces of Edward I. Wallace destroyed the garrison, and threw the dead bodies into a dungeon called 'Wallace's Larder.' Pop. in 1871, 3845.

ARE, the unit of the French land-measure, is a square, the side of which is 10 metres (or 32·809 feet) long (see METRE), and which, therefore, contains 100 square metres = 1076 English square feet. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2·47 English statute or imperial acres.

A'REA (Lat.) is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the ultimate objects of geometry. The measuring unit is a square inch, a square foot, &c., according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure.

ARECA, a genus of Palms, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. Catechu*, the PINANG PALM, or Betel-nut Palm, is a native of the East Indies, whose nut yields a sort of catechu. See CATECHU. This Areca-nut, or Betel-nut, is very much used in all parts of the East, the chewing of it with quick-lime and the leaf of the betel-pepper being one of the most prevalent habits of the people. See BETEL. The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form a considerable article of trade in the East. The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 feet high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap.—*A. oleracea*, the CABBAGE PALM of the West Indies, is a very tall tree, 100–200 feet, whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender. The nuts are produced in great numbers; they are about the size of a filbert, and have a sweet kernel.—*A. sapida*, the New Zealand Palm, is remarkable as extending southward beyond the geographical limits of any other of its order, as far indeed as lat. 38° 22·S. It is a small palm, only from 6 to 10 feet high, with leaves 4–6 feet long. The young inflorescence is eaten. *A. vestiaria*, a native of the East, is so called because clothing is made from its fibres.

AREIOPAGUS (Gr. for 'Mars' Hill'), a mount lying to the west of the Acropolis, at Athens, and celebrated as the spot where the most venerable court of justice in ancient times held its sittings. It is not easy to determine satisfactorily why the hill obtained its name; most probably it was on a

of sacrifices having been offered there at an early period to the God of War; but all its historic importance is derived from the Areiopagitic Council, the origin of which reaches far back into antiquity, and is ascribed by some to the semi-mythological Cecrops. Orestes, according to tradition, was tried before this court, and it is certain that it must have existed long before the first Messenian War (740 B.C.), for the Messenians, in offering to submit to its decisions certain points of dispute, speak of it, even then, as 'old.' Solon, however, made many changes in its constitution, enlarging its sphere of jurisdiction to such an extent that it ceased to be any longer a mere criminal court, and acquired henceforth social and political powers in addition to the former. Before Solon's time, it was strictly oligarchical. It now became a *tertium quid* between aristocracy and democracy, the new qualification for office introduced by Solon being *property* instead of *birth*. It thus naturally allied itself with aristocracy, so that we can perfectly understand why it should have been considered a check upon the impetuous democracy, though it would, perhaps, be fairer to regard it as a check upon both extremes. It is not known how many members were included in its council. The nine archons—if they had recommended themselves by a faithful discharge of their duties—were elected life-members of it. Solon made the council 'overseers of everything,' and we find instances of their manifold authority in the subsequent history of Greece. They granted money, at the time of the Persian invasion, from a reserve treasury of their own, the ordinary public treasury being empty. After the battle of Chæroneia, they executed all who had deserted their country. In social matters, their powers appear to have been curiously minute. They had officers whom they sent or accompanied into private houses, on occasion of a festivity, to see that the rooms were not overcrowded; they called to account persons who lived in such riotous extravagance that their example might be considered hurtful to the community, and conferred marks of honour on those of an opposite character. Their sphere of influence seems to have extended itself to religion also. Innovations in the worship of the gods, neglect of the sacred ceremonies, impiety in any form, brought the offenders under the rebuke and punishment of the A. It is likewise asserted that they possessed and exercised great authority in the education of the young, although this statement, and that regarding some charitable functions attributed to them, are of dubious value.

Until the time of Pericles, the brilliant and powerful ruler of the democracy, the A. continued to maintain its ancient dignity. He soon discovered, however, that it would prove an insurmountable obstacle to the realisation of his designs if not shorn of its privileges. After much and vigorous opposition, he succeeded in carrying a decree (458 B.C.), by which, as Aristotle says, the A. was 'mutilated,' and democratic tribunals acquired supreme authority. It is, however, far from being clear what were the precise changes which Pericles effected, whether he abridged its powers as a criminal, or as a social and political court. From the high estimation in which it was held for centuries after, in the first of these capacities, we are inclined to think that it was its social and political supremacy that was destroyed. Probably the A. was made responsible to the demus, or body of citizens. It lingered in life for a very long period. We hear of it as late as 380 A.D., and it would seem, from the case of St Paul, that it possessed in his day a certain authority in religious matters.

ARE'NA, a part of an amphitheatre (so called because it was usually strewed with sand, though when a fit of extravagance seized the Roman emperors, they used borax and cinnabar instead), where the combats of gladiators and wild beasts took place. It had four main entrances, and was surrounded by a wall about 15 feet high, so that the spectators were perfectly safe. The name was afterwards applied by the Romans to any building for exhibitions of baiting animals, horsemanship, &c. On the continent, the name has been given to the large summer theatres for dramatic performances in the open air. It is applied also, in a general sense, to any scene of contest or display of power.

ARENA'CEOUS ROCKS. All rocks composed entirely, or to a large extent, of grains of silex, are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally water-worn and rounded. In older deposits, the grains of sand are bound together by silicious, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartzy materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of feldspar occur, it is a *feldspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. The presence of lime can always be detected by the effervescence which takes place on the application of muriatic or other acid. When the sandstone is coarse-grained, it is usually called *grit*. If the grains are large enough to be called pebbles, it becomes *conglomerate* or *puddingstone*; if the fragments are sharp and angular, it is called *breccia*.

ARENA'RIA or SANDWORT, a genus of plants of the natural order *Caryophyllæ*, differing from Stellaria (Stitchwort, q. v.) chiefly in the undivided petals. The species are numerous, annual and perennial herbaceous plants of humble growth, rarely somewhat shrubby, natives of the temperate and colder parts of the world. Some of them are arctic and alpine plants. Many of them are chiefly found in sandy soils. The flowers are generally small and inconspicuous, but if closely examined, are seen to possess no little beauty. A number of species are natives of Britain.

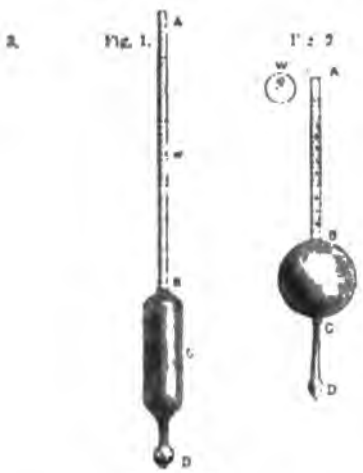
A'RENDAL, a town on the south-east of Norway, situated near the mouth of the Ni... the bay of Christiania, with a population o... It is built partly on poles, partly on rock, an... circumstance, as well as its situation, gives it a very romantic aspect. The bay, which is protected by the island of Tromöe, forms an excellent harbour, and favours the commerce of the town, which is considerable, in proportion to its size. A. is intersected by canals; its exports are iron from the neighbouring mines, and wooden articles. Shipbuilding is also carried on; and on a smaller scale, distilleries and tobacco-factories. King Louis Philippe, after the French Revolution, when wandering in the north as Duke of Orleans, made some stay here.

ARE'NG or ARENGA. See GOMUTO PALM.

ARENI'COLA. See ANNELIDA.

AREO'METER (*araios*, thin, and *metreō*, I measure; Fr. *aréomètre* or *pèse-liqueur*; Ger. *Ardometer* or *Senkwage*), called also Hydrometer, an instrument which is allowed to float freely in liquids, to determine their specific gravity or that of solid bodies. By specific gravity (q. v.) is meant the ratio that the

f volume of a substance bears to the ame volume of water. Thus, a cubic l weighs 793 ounces, while the same ter weighs 1000 ounces; the specific ol is set down, therefore, as $\frac{793}{1000}$ or foot of sulphuric acid weighs 1841 s, consequently, a specific gravity of elations are not confined to the par- , one cubic foot, of these bodies, but y equal volumes of them. Equal volumes water, and sulphuric acid, have always to r the ratio respectively of 793, 1000, and d this is only an instance of the general equal volumes of different substances bearing to each other the direct ratio gravities of these substances. This on which areometers with weights, ters, are constructed. If, how- we ts of any two of these liquids ed, it would be found that 793 of a ater would weigh as much as 1·000 cubic ohol; 1·000 cubic foot of sulphuric acid as 1·841 cubic feet of water; or ·793 of a of sulphuric acid as much as 1·841 cubic ohol: more generally thus—when equal two different fluids are taken, the of each are inversely as their specific his latter principle depends the use with scales, or scale-areometers. The more commonly employed than the s is, in consequence, a much more instrument. Of the various forms of ometers, that contrived by Gay-Lussac particular notice, from the simplicity of of graduation; and an account of it will best idea of the general nature of such Fig. 1 gives a representation of it. It



Areometers.

a uniform glass tube, AB, blown into two d D. at bottom. The lower bulb, ed w ay, so that when the instru- is liquid, the stem, AB, is main- position. We shall suppose that mercury is so adjusted that when er, the A. sinks to the point W, which consequence, be called the water-point. o the principle of Archimedes, the weight me of water displaced by the instrument point is equal to the weight of the instru- et us suppose, for the sake of simplicity, that the water so displaced is a cubic inch, the weight of the A. will be that of a cubic inch of water, or 250 grains (more correctly 252·5 grains at 60° F.). If the A. be now placed in a fluid heavier than water, such as a mixture of sulphuric acid and water, having a specific gravity $\frac{5}{4}$ or 1·25, it is manifest that if it is sunk again to the water-point, the displaced fluid would weigh $\frac{5}{4}$ of 250 = 312½ grains, or 62½ grains more than the weight of the instrument. As much, therefore, of the stem of the A. must rise above the liquid as will reduce the weight of the displaced liquid to 250 grains, or reduce the volume to $\frac{4}{5}$ of what it was before. If the stem in this case rises to B, the volume displaced by the part WB is $\frac{1}{5}$ of the volume displaced by the instrument at the water-point. If we consider the whole divided into 100 parts, and mark 100 at W, B must be marked 80, as the A. displaces up to that point $\frac{4}{5}$ of 100; and if the intervening space on the stem be divided into 20 equal parts, each of them will correspond with $\frac{1}{100}$ of the water-volume—viz., ·01 of a cubic inch, or with $\frac{1}{10}\frac{1}{0}\pi$ of the weight of the instrument—viz., 2·5 grains. If the same scale be carried above the point W, and the divisions marked as ascending from 100, the A. will be serviceable likewise for fluids less dense than water, and will mark the volumes which it displaces in each of them. The A. thus graduated gives immediately the volumes which it displaces in different liquids; and from these, seeing that it displaces in every case a weight of liquid equal to its own, the specific gravities may be calculated according to the principle already stated—viz., that equal weights of two different fluids have volumes inversely as their specific gravities. If, in a mixture of sulphuric acid and water, the A. stands at 90, according to the above principle, 90 volumes of the mixture weigh as much as 100 of water; therefore, its specific gravity is $\frac{100}{90}$ or $1\frac{1}{9}$. If, again, in a mixture of spirits and water, it should stand at 110, 110 volumes of the mixture weigh as much as 100 of water, so that its specific gravity is $\frac{100}{110}$, or $\frac{10}{11}$. In all cases, then, 100 is to be divided by the number read on the A., to determine the specific gravity of the liquid in which it floats.

The delicacy of the A. depends on the distance of the divisions on the scale, or on the thinness of the stem compared with the bulbs. An instrument possessing this advantage cannot be made to serve both for liquids heavier and lighter than water, for the stem would be of an inconvenient length; and it is usual to construct two areometers one marked with the water-point at the top, and the scale descending to 50, for fluids heavier than water; and the other, with the water-point at the bottom, and the scale ascending to 150, for fluids lighter than water. The scale is generally marked on a slip of paper, which is fixed inside the stem. Gay-Lussac's A. is also known under the name of 'volumometer.' Although it cannot be surpassed either for accuracy or simplicity, it is much less used than other instruments of a similar nature furnished with arbitrary scales, requiring the aid of tables to interpret the readings. The best known of these is Twaddle's A., used in England; and Beaumé's A., extensively adopted on the continent. The A. with an equally divided scale is a very ancient instrument; it was known among the Greeks under the name of 'baryllion.' On some areometers the divisions are not at equal distances, but are so drawn as to give at once, without table or calculation, the specific gravity of the fluid in which they are placed. Although very desirable, in practice they do not possess the accuracy of the A.

with equally divided scales, because the graduation of them is attended with considerable difficulty.

No form of A. can be made to determine specific gravities with perfect accuracy, and such instruments are only useful where a ready and good approximation is all that is needed. They are, in consequence, employed chiefly to ascertain the specific gravity of the various liquors and solutions which occur in the arts and manufactures, and very frequently they are graduated with reference to special liquids, as spirits, wine, milk, brine, &c. The Alcoholometer or Hydrometer of Sikes is an instrument of this latter description, and is in general use in the Excise for estimating the strength of spirits. It is represented in fig. 2. BC is a hollow brass ball, surmounted by a flat stem AB, and loaded below by a short conical stem CD, terminated by the pear-shaped bulb D. It is accompanied by eight weights, by which the weight of the instrument may be increased, and the range of the scale extended to fluids heavier as well as lighter than water. One of these weights, W, is shewn in the figure; it is furnished with a slit, so as to allow of it being slipped on to the narrowest part, C, of the lower stem. The stem, AB, is graduated into 11 equal parts, and these again into halves; and the instrument is so adjusted that its indications give the volumes of water that must be added to or taken from 100 volumes of the mixture under examination to reduce it to proof-spirit (see ALCOHOL), which is a mixture of nearly equal parts of water and alcohol. Thus, if the A. indicates 11 over-proof, 11 volumes of water must be added in order to bring the liquid down to proof-strength; and 100 gallons of such strength would be reckoned as 111; 100 gallons, at 11 under-proof, would in the same way be charged as 89. Very carefully-constructed tables accompany the instrument, in which the specific gravity and percentage of alcohol of different mixtures, at different temperatures, are marked, corresponding to each degree of the A. Since the specific gravity of alcohol is known, it might be thought, that if that of a mixture of it with water were known, the relative proportions of each would also be known. Such, however, is not the case, for alcohol and water possess a chemical affinity for each other, which causes the combined volumes of the two to measure less than the two volumes separately. Thus, 50 volumes of alcohol mixed with 50 volumes of water does not make 100 volumes of the mixture, but only 96, and thereby the specific gravity of the mixture is higher than it would have been if no contraction had taken place. As the law of this contraction is very complicated, the relative proportions of the two in a combination of given specific gravity, are only to be estimated from tables founded upon experimental data.

The peculiar feature of areometers with weights is, that instead of a scale, they have only one mark on the stem, to which the A. is in all cases sunk. One of the best-known instruments of this kind is the A. of Nicholson. It consists of a brass tube, BC (fig. 3), about 1 inch in diameter, closed above and below by conical ends, to the upper of which a wire is fixed, carrying on the top of it a cup A, capable of containing the weights; and to the lower, a hook is attached, from which hangs the cup D. The lower part of the cup, D, is also provided with a hook, and the whole instrument is kept vertical, partly by the weight of the cup, and partly by the weight of the ball, E, suspended from it. On the wire, a notch, W, is made, to serve as the mark or fixed point to which the A. is sunk. The specific gravities of liquids are determined by Nicholson's A. in the following way: The weight of the A. itself is first ascertained—let it be in a given case 2000 grains—it is then put into water at the temperature 60° F., and weights (say 500 grains) put in, till it is sunk to W. It is now removed to the liquid under examination; and if the weight required to sink the instrument now to the standard-point be only 100 grains, we have the specific gravity of the liquid equal to $\frac{2}{2}\frac{0}{1}\frac{0}{0}\frac{0}{0}$, or $\frac{2}{2}\frac{0}{1}$. In both fluids, the same volume has been displaced, and that is in each case equal to the weight of the A.; but the weight of the A. in the second case was 2000 + 100, and in the former, 2000 + 500; hence the above result. Nicholson's A. is seldom used for finding the specific gravity of fluids; its use is almost entirely restricted to ascertaining that of small solid substances, as gems and small pieces of minerals. The following example will shew how this is done: If in the cup of the A. already mentioned, when placed in water, the gem be put, and only 440 grains be then necessary to bring the instrument to W, 60 grains is manifestly the weight of the gem, because 500 grains were needed with it to do the same thing. The gem is next placed in the lower cup, D, and if 460 grains are now necessary to sink to the standard-point, the gem has lost 20 grains of its weight by being immersed in water. According to the principle of Archimedes (q. v.), these 20 grains are also the weight of a volume of water equal to that of the gem; its specific gravity of the gem is $\frac{6}{2}\frac{0}{0}$, or 3. By using the cup D, which is furnished with perforations to allow free passage to the air, and attaching a weight, E, to the handle of it, the specific gravity of substances lighter than water may also be determined by this instrument. The other forms of weight-areometers are those of Fahrenheit, Tralles, and Charles. For the more accurate determination of the specific gravities of liquids and solids, see SPECIFIC GRAVITY.

AREQUI'PA, a term primarily applied to a mountain in the west Cordillera of the Peruvian Andes, and secondarily to a city at its foot, being from this, again, extended to a district, a province, a department, and a diocese. 1. The city, [illegible] in lat. 16° 13′ S., and in long. 76° 18′ W., is largest in Peru, being inferior only to [illegible] Cuzco, and is said to contain 30,000 inhabitants. It carries on a considerable trade both with the interior and by sea. Its port is Islay, one of the larger harbours of the republic. 2. The department is bounded N. by Lima; E. by Ayacucho, Cuzco, and Puno; S. by Moquega, which, along with it, forms the diocese; and W. by the Pacific. It contains 200,000 inhabitants, and is subdivided into [illegible] provinces. Like nearly the whole of the region of Peru, it is generally arid. [illegible] 3. The mountain is volcanic, of the form of a truncated cone, and of the height of 20,320 feet. Its neighbourhood is subject to earthquakes.

ARÈS. See MARS.

ARETÆ'US, a famous physician of Cappadocia, who flourished in the latter half of the 1st century, or the beginning of the 2d century after Christ. He is considered to rank next to Hippocrates as a writer with which he treated diseases; but he does not, in every instance, follow the practice of the 'Father of Medicine.' He was less attentive to 'the symptoms and actions' of the system, which he frequently neglected, if he thought it desirable; administered powerful purgatives copiously, employed narcotics, and was not object to bleeding. He was, in fact, noted for his total want of professional bigotry; and having not committing himself to any particular set of opinions, in his accuracy in the detail of symptoms and the diagnosis of disease, he is superior to most of the ancient physicians. His great work, written in

concise Ionic Greek, is divided

the monasteries of San Bernardo at Arezzo,
the Oliveto near Florence. Vasari thought
finest works of A. were those which he
executed for the Campo Santo at Pisa, illustrating the life of San Ranieri. Of these, however, we have only prints, and cannot therefore judge satisfactorily. His principal works, still remaining, are those from the life of Pope Alexander III. in the town-hall of Siena. He died in 1408.

Throughout all Italy, A. was greatly admired for his invention, the grace and simplicity with which he arranged his figures, and the finish of his style. His Madonnas possessed a remarkable sweetness of expression; and his colouring was in most cases bold and beautiful. Vasari prefers him to Giotto.

ARE'ZZO (ARETIUM), the chief city of the Italian province of A., is situated in a fertile valley near the confluence of the Chiana with the Arno, lat. 43° 27′ N., long. 11° 52′ E. It is 38 miles E.S.E. from Florence. A. is perhaps the oldest town in Tuscany, and formed one of the twelve cities of the ancient Etruscans. It was devastated by Sylla during the Social War; and, like many other Italian cities, was sacked by the Goths when they burst into the peninsula. During the contest of the Guelphs and Ghibellines, in a later age, it became subject to Florence, whose troops defeated those of A. at the battle of Camaldino, in which the poet Dante took part. Arezzo contained (1872) 38,907 inhabitants; but its extensive walls and numerous churches bear record of its more flourishing and more populous period. The *Piazza Grande*, the *Pieve*, an old church founded on the site of a heathen temple, and the cathedral, which, like almost all the other churches, has an unfinished façade, are its principal public buildings. The cathedral has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the old Tuscan school of painting. These ecclesiastical decorations are contrasted with the general aspect of the city, which has dark and dirty streets. Its industry is at present at a very low ebb, there being few or no manufactures, and its people are not generally favourites in Italy; but perhaps no city of its size ever produced a greater number of celebrated men, among whom may be mentioned – Mæcenas, the famous patron of letters in the time of the Emperor Augustus; Petrarch; Pietro Aretino; Guido de A., inventor of the gamut; Leonardo de A., the historian; Cesalpino, the botanist; Redi, the physician; Pope Julius III.; the notorious Marshal d'Ancre; and Vasari, author of *Lives of the Painters*. Michael Angelo was also born in the vicinity of A. The province of A. contains 1276 square miles, with a population of 239,901. The soil is fertile in corn, wine, and oil.

ARGALA. See ADJUTANT.

ARGALI (*Ovis Ammon*), the great wild sheep of Siberia and Central Asia. It is found from Kamtchatka to the Himalaya Mountains, where, however, it is only seen in the more elevated regions. 'We

Head of the Argali Sheep.

came suddenly,' says Dr Hooker in his *Himalayan Journal*, 'upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were twenty-five of these enormous animals, of whose dimensions the term sheep gives no idea; they are

very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet.' The horns of the male are nearly 4 feet long, and 14 inches in circumference at the base, where they are triangular. The general colour is fulvous gray, white beneath, with a whitish disk around the tail. The wool is concealed by hair. The name A. is Mongolian, and was adopted by Pallas. A similar but smaller species is also found on the Himalaya Mountains. The Rocky Mountain Sheep, or Big-horn, is sometimes called the American A. See SHEEP.

ARGAN (*Argania sideroxylon*, *Sideroxylon spinosum* of Linnæus), a low spiny evergreen tree of the natural order *Sapotaceæ*, a native of the southern parts of the kingdom of Marocco, bearing an ovate drupe about the size of a plum, dotted with white, and full of a white milky juice. The Moors extract an oil from the fruit, which they use with their food.

ARGAND, AIMÉ, physician and chemist, was born at Geneva about the middle of the 18th c. He was the inventor of the well-known *Argand lamp*. The chief difficulties that attended the use of lamps as a source of light were—first, in procuring the complete combustion of the oil, so as to keep the flame from smoking; and second, in preventing the level of the oil in the reservoir from sinking as the combustion goes on. The round cotton-wick, used in the old simple form of lamp, was always attended with smoke and smell. The oils and fats are exceedingly rich in carbon, containing 70 to 80 per cent. of that element, and only 10 to 12 of hydrogen. The round thick column, then, of oil-vapour rising from the wick of an old-fashioned lamp, presented too little extent of surface to the air; the oxygen of all the air that could get access was chiefly taken up in burning the hydrogen, and a large proportion of the carbon ascended in the burnt air as smoke. A.'s improvement was that he made the wick in the form of a ring. The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the lamp did not satisfy the expectations of A., till his younger brother accidentally discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded.

Argand Burner.

A. was soon involved in a dispute with one Langé of Paris regarding the originality of his invention. He went thither to vindicate his claim, but rather than risk the chances of a lawsuit, he consented to share the honour, and a patent was obtained by which Langé and A. alone were authorised to make and sell the new lamps in France for 15 years. The French Revolution, however, destroyed their privilege, and A. retired to England. After some time, he returned to his native country, a victim to melancholy and fantastic humours, and died on the 24th October 1803.

ARGAUM, a village in the territory of the Nizam. It is in lat. 21° 2′ N., and in long. 77° 2′ E., on the route between Ellichpore and Aurungabad. Its single claim to notice is that, on 28th November 1803, about two months after the battle of Assaye, Major-general Wellesley here gained another victory over the Mahrattas. To commemorate this action, a medal was struck in 1851, about a year before the death of the illustrious conqueror.

ARGEL, or ARGHEL (*Solenostemma A.*, or *Cynanchum A.*), a plant of the natural order *Asclepiadaceæ*, a native of Arabia and of the north of Africa, deserving of notice only because of the frequent use of its leaves for the adulteration of senna. They are lanceolate and leathery, and may readily be distinguished from genuine senna leaves by their texture, their being downy, their greater heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna-leaves being unequal. They are acrid, and cause sickness and griping, but a difference of opinion subsists as to their possessing purgative properties.

ARGELANDER, FRIEDRICH WILHELM AUGUST, one of the most eminent astronomers of our time, was born, March 22, 1799, at Memel. He studied at Königsberg, where the science of finance first attracted him; but he was subsequently drawn away to that of astronomy by the lectures of Bessel, by whom he was employed to make calculations and observations. In 1820, he was appointed assistant to Bessel in the Königsberg Observatory, and in 1823 succeeded Walbeck as astronomer at the observatory of Abo, in Finland. Here he commenced a series of observations on the fixed stars which have a perceptible 'proper motion.' His studies were unfortunately interrupted by a fire which destroyed the observatory; but after a time, he resumed them in a new observatory at Helsingfors, and published a catalogue of not less than 560 stars having 'proper motions.' This contained the results of his observations at Abo, and received from the Ac of St Petersburg the great Demidov prize. removing to the university of Bonn in 1837, A lished his *Uranometria Nova* (Berlin, 1843). taining celestial charts of the fixed stars s hemisphere with the naked eye; also *Astronomical Observations*, containing the re an examination of the northern heavens fr 80° declination, and giving the positions stars. For a considerable number of been engaged in a series of obser changes of light in variable stars. demonstrated the theory that there is a pr motion of the solar system in space.

ARGE'MONÉ, a genus of plants of the natural order *Papaveraceæ*, distinguished by 4—6 petals 4—7 radiating concave stigmas, and an obovate ca opening by valves at the point. *A. Mexicana*. times called Mexican Poppy, is an annual plant with large yellow flowers, and s and sinuated, spiny leaves, variegated w is a native of Mexico and of the southern p United States, and is now also common tropical and sub-tropical countries, in wh been naturalised. Its seeds are narcotic. p and diuretic, exhibiting in a strong d qualities of the order of which the seeds c. are devoid. They are used in the West substitute for ipecacuanha, also instead and the juice of the plant is employed for ophthalmia.—This plant is not be seen in flower-borders in Br northern parts, at least, the seed a hot-bed.

ARGENS, JEAN BAPTISTE DE BOYER, born at Aix, in Provence, June 24, 17 originally intended for a learned career; be love of adventure, he entered the army at Fascinated by a certain actress, he eloped to Spain, but was captured, and bro Provence. matters in the most deplorable condi-
French troops, decimated by sword and
were in full retreat across the Rhine; the
swarmed in Alsace and Lorraine,
and the very political existence of France was imperilled; but the vigorous efforts of A., and his singularly lucky choice of generals, completely changed the fortunes of the war in the course of one year. The theatre of strife was transferred to the Low Countries; and after the victories of Fontenoy and Lawfeldt, the capture of Bergen-op-Zoom, and the investment of Maestricht, peace was secured by the famous treaty of Aix-la-chapelle, signed in 1748. A., however, did not remain inactive. He built new fortresses and repaired old ones, established the *E'cole Militaire* in 1751, and, by various measures, sought to keep alive the military ardour and spirit of the nation. He was likewise an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great *Encyclopédie*. He was the friend of Voltaire, whose fellow-student he had been, and furnished him with materials for his *Siècle de Louis XIV*. On the breaking out of the war again in 1756, his valuable services were neglected, and next year he was deprived of his office, and exiled to his estate of Ormes, where he spent six dreary years. It is supposed that this calamity befell him through the machinations of Madame Pompadour, his worst enemy. On her decease, he returned to Paris, where he died in 1764.

A'RGENT, the French word for silver, is always used in English heraldry to signify that metal. In engraving shields, it is left white.

ARGE'NTEUS CODEX. See ULFILAS.

A'RGENTINE (*Argentina*), a genus of small fishes of the family *Salmonidæ*, of which one is rarely found on the British shores, and two or three are found in the Mediterranean. They are chiefly remarkable for the resplendent silvery lustre of their sides, and the abundance of *nacre*, the substance used in making artificial pearls, with which their air-bladder is externally loaded. It consists of a coat of silvery fibres. Upon account of it, they are sought after. They are commonly taken in nets along with anchovies or sardines.

A'RGENTINE REPUBLIC, the confederation of the Rio de La Plata, or River of Silver, South America—the Latinised epithet and the Spanish term being merely copy and original of one and the same misnomer. Lat. 22° 30'—41° S., long. 54°—70° 31' W. This confederation, as constituted by its reunion with Buenos Ayres in 1859, consists of what may be roughly termed a rectangle comprising 19° of lat. and 13° of long. On the west it is bounded by the Andes, which separate it from Chili and the desert of Atacama; on the north by Bolivia; by Paraguay, Brazil, Uruguay, and the Atlantic on the east; and on the south by Patagonia. The republic embraces 14 provinces, divided into 173 departments. The following table is compiled from the census of 1869:

Provinces.	Departments.	Area in sq. miles.	Population.	Chief Towns.	Population.
1. Buenos Ayres,	31	83,615	495,107	Buenos Ayres	177,787
2. Santa Fé,	4	25,087	89,117	Santa Fé,	10,670
3. Entre Rios,	10	23,952	134,271	Concepcion,	6,531
4. Corrientes,	17	45,454	129,023	Corrientes,	11,218
5. Cordova,	14	58,599	215,898	Cordova,	28,523

The Indians, as well as foreigners, are counted in

these numbers. Of the latter there were reckoned (1869) about 200,000 in the republic, consisting of Americans, Italians, Spaniards, French, English, Swiss, Germans, and others. The A. R. claims, besides the provinces enumerated, the desert of Gran Chaco in the north; and that which, in the south, lies between the Rio Colorado and the Rio Negro; Patagonia is also included within its pretensions. These wide and wild domains, however, have been hitherto sources rather of disquiet than of desirable acquisition, as the Indians occasionally commit inroads upon the settled provinces.

Except the most purely Indian districts to the west of Buenos Ayres, the provinces of the A. R. lie chiefly in the basin of the Rio de La Plata, embracing much the larger half of the same. Mountains abound in the north-west; and elevated ranges are found also in Entre Rios, which is situated, as its name implies, between the Parana and the Uruguay. But, with these exceptions, nearly the whole country presents boundless plains, covered alternately with rich pasturage and gigantic thistles. The climate and productions vary considerably—being tropical and temperate respectively to the north and south of Corrientes (in 27° 27′ N. lat.). Agriculture, however, of every description is very backward—less, perhaps, than $\frac{1}{1000}$ of the surface being under cultivation. The rearing, in fact, of live-stock is the grand business of the country. Millions of cattle wander at will across the plains, or are kept on breeding-estates of vast extent; and likewise of mules and horses there are immense bands. Besides the Rio de La Plata, which is rather an estuary than a river, and its far-reaching affluents, the hydrography of the A. R. comprises the head-waters of some southern streams, which fall into the open Atlantic, such as the Rio Colorado, the Rio Negro, &c.; and along the west border, under the shadow, as it were, of the Andes, salt-lakes are common. In connection, doubtless, with this feature in the hydrography, mines of rock-salt exist, and salt here and there abundantly encrusts the plains, both to the satisfaction and benefit of the roaming herds. The names of the country and its estuary, as indicating the presence of silver, have been already characterised as misnomers; and though mines of other minerals—such as sulphur and alum—are found in the neighbourhood of the Andes, yet few, if any, of them are wrought.

In 1515, Juan Diaz da Solis, while searching for a passage into the Great South Sea newly seen by Balboa, entered the Rio de La Plata. In 1526, Sebastian Cabot, son of the discoverer of Newfoundland, penetrated nearly to the confluence of the Parana and the Paraguay, being arrested by the rapids, which afterwards gave name to Corrientes. In 1535, Buenos Ayres was founded, to command, though indirectly, the most practicable channel of the only outlet of the country, a city which, in conjunction with its own colony of Monte Video, on the opposite bank, has virtually monopolised the history of a region equal in extent to Western Europe. Gradually other cities were planted, partly by colonists from Spain, and partly by adventurers from Peru, generally giving each its own name to its own province; and the grand staples of the country horses and cattle had been largely introduced before 1552. Down to 1775, the basin of the Rio de La Plata was a dependency of the viceroyalty of Lima. In that year, however, was erected the viceroyalty of Buenos Ayres, which, to the basin in question, added Bolivia, under the name of Upper Peru, thus embracing the head-waters of the Amazon, and also most of the plateau of Titicaca. The year 1806 ushered in a new order of things. Spain, as an ally of France, being then at war with England, both Buenos Ayres and Monte Video were occupied by the English—a change which, brief as was its duration, virtually sowed the seeds of revolution. The colonists had felt the inconvenience of belonging to a state which left them, in a great measure, to defend themselves; they had successfully tried their strength against a foe more powerful than their own masters; and they had been encouraged not less by the sayings, than by the doings, of their invaders to assert their independence. These influences were, in fact, instantaneously exemplified. The triumphant militia, after deposing and expelling the legitimate viceroy for cowardice, elected in his stead the French officer who had led them to victory. Thus had the viceroyalty of Buenos Ayres become peculiarly ripe for taking its share in the outbreak, which Napoleon's dethronement of the Bourbons, in the spring of 1808, almost immediately occasioned throughout Spanish America. The constituents of the A. R. did not, however, submit to the sovereignty of Joseph Bonaparte when he was shuffled on to the Spanish throne to replace Ferdinand VII. In 1810, they organised a government in the name of the latter monarch. This arrangement, which lasted only for a short and inglorious period, ended, like a great many others, in utter confusion. In 1816, a General Congress declared the independence of the 'United Provinces of Rio de la Plata;' but those provinces, in 1827, returned once more to a state of isolation. In 1831, Buenos Ayres, Entre Rios, Corrientes, and Santa Fé, sometimes classed as the coast or riverine states, entered into a federal compact, and invited the others to form a voluntary alliance with them. This Argentine Confederation led to little but anarchy till 1835, when General Rosas was elected captain-general or governor of it, with all but absolute power. He secured quiet and order for a time; but the great aim of his policy, both warlike and commercial, being to achieve the supremacy of Buenos Ayres, the struggles with this end in view, to which he was goaded on also by personal ambition and reckless daring, led to his ultimate overthrow in 1851. Buenos Ayres, refusing to submit to Urquiza, the next governor of the A. R., declared itself independent in 1854; but was compelled by a signal defeat at Cepeda, in 1859, to re-enter the confederation. Continuing restless, however, another war, in which its army was ably led by General Mitré, placed that province in the position of supremacy which it still (1874) holds under General Sarmiento, his successor in the presi[illegible] A serious complication with Uruguay bega[illegible] Brazil and the A. R. blockaded the vario[illegible] that state and besieged Monte Video. [illegible] the interference of Lopez, the president of [illegible] and to a disastrous war, which ended only death in 1870, and which accomplished [illegible] no result in the interest or to the cre[illegible] A. R. The boundless interior of this cou[illegible] standing feud with the narrow sea-board wh[illegible] it out from the ocean; the Banda Oriental a bone of contention between the Brazilians Argentines; while England and France, [illegible] to the freedom of commerce, have thro[illegible] weight in favour of its separate and inde[illegible] existence. The jealousies also of Buenos Ay[illegible] Monte Video are constant sources of irritatio[illegible]

A'RGES, a genus of small fishes, of *Siluridæ*, of extreme interest on accou[illegible] being frequently thrown out in vast [illegible] by some of the South American volcan[illegible] torrents of muddy water. Humboldt was accurately to inquire into this wonder [illegible] to describe one of these fishes,

shales, and called *P. cyclopum*. It ... *opum*. The quantities of these ... the volcanoes in the neighbour- ... times so great, that the stench ... is felt at a great distance, ... are caused by it. ... a crude variety of cream of tartar ... crust in the interior of wine-vats ... Originally, it exists in the juice ... is soluble therein; but during the ... of the juice, and as it passes into ... alcohol is developed, which remaining in the fermenting liquor, causes the precipitation of the A.; the latter being very sparingly soluble in an alcoholic liquid. Some wines, when they are bottled, are not fully ripe, and more alcohol being thereafter developed, a further precipitation of A. takes place as a crust in the bottles, and hence the meaning of the term *crusted port*. A. is generally of a reddish tinge, obtained from the colour of the grapes, but sometimes is of a grayish-white colour, when it has been deposited during the fermentation of the juice of colourless grapes. The *red* or *white A.* is denominated in commerce *crude tartar*, and its principal uses are in the preparation of cream of tartar (q.v.) and tartaric acid (q.v.). The constituents of A. are bitartrate of potash (cream of tartar), (KO,HO,$\bar{T}$), tartrate of lime, with colouring and extractive matters.

A'RGOLA. See ADJUTANT.

A'RGŎLIS, the north-east peninsula of the Morea (Greece), lying between the Bays of Nauplia and Ægina, forms a nome, or department, in the modern kingdom of Greece. The plain of Argos, famous in ancient times for its breed of horses, is naturally fertile, but is now made pestilential by morasses. It is surrounded by an eastern continuation of the range of mountains on the north of the Peloponnesus, which also girds the riven and shattered-looking coast. The highest summits attain an elevation of between 5000 and 6000 feet. The plain of A. is the most extensive in the whole peninsula, being 12 miles in length, and 5 in breadth. The eastern part is higher and more rocky than the western. Near where the plain opens on the sea, the ground is marshy. This was the Lernean marsh of antiquity. The nome of A. and Corinthia has now Nauplia as its capital, and contains 127,820 inhabitants.

It was from the importance of the ancient kingdom of A. that the Greeks were collectively often styled Argivi by ancient writers. A. was colonised in very early times. According to the old traditions, Inachus, the Pelasgic chief, settled here in 1800, and Danaus in 1500 B.C., with colonists from Egypt. Here Pelops ruled, and was succeeded by Atreus, Agamemnon, &c. Here also Hercules was born, and achieved his victories over the Lernean hydra and the Nemean lion.

The ancient capital, Argos, was situated about 3 miles from the sea, and was considered the oldest city in Greece. It was supposed to have been built by that Inachus of whom we have spoken, or by his grandson Argus; but as the whole period in which his deeds are said to have been accomplished belongs to the unhistorical age, we cannot possibly determine the truth of such a statement. It is certain, however, that at one period A. was the head of a league composed of several Doric states or cities—Cleonæ, Phlius, Sicyon, Troezen, Hermione, Ægina, and Epidaurus. Latterly, Sparta robbed it of its supremacy and influence. The population of A., during its most prosperous condition in ancient times, was—inclusive of the town-territory—upwards of 100,000. It was noted for the attention it paid to the worship of the gods. Juno was the principal divinity, but many of the other gods had temples and statues also. This gave a stimulus to the fine arts, and we know that A. possessed one of the most famous of the ancient schools of statuary. The natives were, moreover, renowned for their love of music. Herodotus considered them the finest musicians in Greece. They do not, however, seem to have cultivated literature. Few poets, and no orators or philosophers, were born amongst them. The modern Argos, built on the site of the ancient, is 7 miles from Nauplia, and is a large and thriving

town. It still exhibits some remains of antiquity, though these were nearly wholly destroyed in 1825, during the Greek war of independence. Cotton, vines, and rice are grown. Pop. 11,000.

A'RGONAUT (*Argonauta*), a genus of cephalapodous mollusca, pretty generally known by the name of *Paper Nautilus*, and in consequence of similarity in the form of the shell, often confounded with the genus *Nautilus* (q. v.), but in fact much more nearly allied to the Poulpe (*Octopus*). The shell is not chambered like that of the true nautilus, but has one spiral cavity, into which the animal can entirely withdraw itself. The animal has no muscular attachment to the shell, and some naturalists therefore suspected that it might be merely, like the Hermit Crab, the inhabitant of a shell originally belonging to some other animal; but this question has been set at rest by the observations of Madame Power, proving the beautiful but fragile shell to be the production of the A. itself. It has, however, also been discovered that the shell is peculiar to the female A., and does not answer the ordinary purposes of the shells of mollusca, but rather that of an

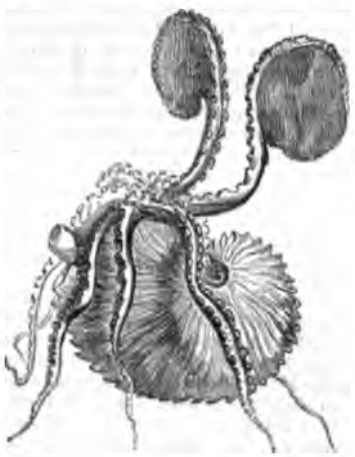

Fig. 1.

'incubating and protective nest.' The eggs, which are very numerous, are attached to filamentary stalks, and by these the whole compacted mass is united to the involuted spire of the shell, where it is usually concealed by the body of the parent. The descriptions, until recently admitted into the works of the most respectable naturalists, of argonauts sailing about in pretty little fleets upon the surface of the water, employing six of their tentacula as oars, and spreading out two, which

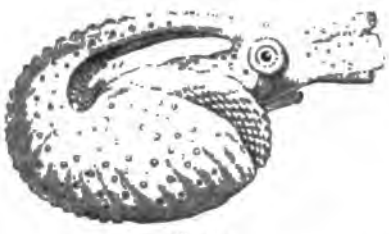

Fig. 2.

are broadly expanded for the purpose, as sails to catch the breeze, are now regarded as entirely fabulous, and indeed are founded upon an entire misapprehension of the position of the animal in its shell, and of the use of the two expanded arms or *vela* (sails). The membranes of these arms are extended at the pleasure of the animal, so as to envelop the shell, and appear to be the secreting organs employed in its fabrication. Two species of A. are common in the Mediterranean. Fig. 1 represents one of them as it used to be commonly represented with oars and sails. Fig. 2 represents it as it really exists, with the membranes of the dorsal arms covering the shell. The other arms are cut off. At *a*, in fig. 2, is seen the mass of eggs.

A'RGONAUTS, heroes of Greek antiquity (so named from their ship *Argo*), who, according to tradition, about a generation before the Trojan war, undertook a long voyage into unknown seas, under the command of Jason. Homer alludes to the story; Hesiod, Mimnermus, Pindar, the [illegible] Orpheus and many others relate it, all in di[illegible] accounts in some instances b[illegible] cilable. The plainest and mos[illegible] is that of Apollodorus, which is [illegible] was commissioned by his uncle, Pelias—[illegible] over Iolcus, in Thessaly—to fetch from th[illegible] of Æetes (Colchis) the golden fleece of which was suspended on an oak, and [illegible] sleepless dragon. He therefore cause[illegible] son of Phrixus, to build a ship of fifty pursuit of this adventure, gathered [illegible] choicest heroes from all parts of Gre[illegible] number, with whom he sailed. Their f[illegible] place was Lemnos, where the A. staye[illegible] because the women, in consequence of the Aphrodite, had slain all the men, excepti[illegible] Next they sailed to the Doliones, and w[illegible] ably received by King Cizycus, who was [illegible] accidentally killed by Jason. After Mysia, where they left Hercules and [illegible] —who had wandered too far inland in [illegible] the lost Hylas—they came to the co[illegible] Bebryces, where King Amycus was k[illegible] or Polydeuces, in a pugilistic fight. [illegible] along the coast of Thrace to Salmy[illegible] two of their number, Zetes and Cala[illegible] delivered the blind seer, Phineus, from winged monsters called Harpies, he in re[illegible] them good counsel respecting th[illegible] tures, and especially warned [illegible] dangerous passage between the o[illegible] Symplegades, from which they [illegible] little injury to their vessel. The story Phineus advised the A. to let loose a [illegible] they approached the dreaded rocks, and to from its fortune what they themselves might The bird escaped with the loss of its [illegible] resolved to risk the passage, and [illegible] got safely through, their ship only [illegible] ornaments of its stern. After vis[illegible] lands, they arrived at the mouth o[illegible] in Colchis. Here the king, Æetes, up the golden fleece to Jason, on [illegible] latter should yoke to a plough the two bulls with brazen hoofs, and should so[illegible] teeth left by Cadmus in Thebes. J[illegible] help of the famous sorceress Medea, da Æetes, who had fallen passionately in love bold navigator, fulfilled these co[illegible] also assisted by Medea in still [illegible] exploits. He obtained from her [illegible] marriage, a charm against fire [illegible] enabled to destroy all the warri[illegible] from the land sown with the dragon's [illegible] this was taking place, Æetes had resolved [illegible] ship *Argo*, and put to death the crew. [illegible] informed of the scheme by Medea, [illegible] hastened into the grove, stupified the

[illegible] prepared by Medea, seized [illegible] and, embarking in the *Argo* [illegible] and her brother Absyrtus, sailed [illegible] by night. Æetes followed, but [illegible] by an atrocity committed [illegible] is said that she slew her [illegible] cut him into several pieces, [illegible] overboard, one at a time. While [illegible] yed to gather up the fragments of his [illegible] escaped from the pursuit. The A. now [illegible] the mouth of the river Eridanus; but were [illegible] on the Absyrtian Islands by a storm sent [illegible] love, who was angry on account of the murder [illegible] Meanwhile the mast of the *Argo*— [illegible] from the sacred grove of Dodona [illegible] le to the effect that Jove could [illegible] unless they sailed towards Ausonia, [illegible] ified through the expiatory agency of [illegible] was accomplished; and next, the A. [illegible] by the Sirens, from whose charms they were [illegible] by Orpheus, who sang to them, but could [illegible] one of their number, Butes, from swimming to the sea-maidens; then through Scylla [illegible] by the help of Thetis, and at length [illegible] d of Corcyra, where Alcinous [illegible] place, they encountered a [illegible] were saved by Apollo, who, in [illegible], revealed to them the haven of [illegible] they raised an altar to their pre- At Crete, their landing was opposed by the [illegible], who was slain by Medea. They subsequently touched at Ægina, and sailing between Eubœa [illegible] ived safely at Iolcus, after a four Jason dedicated the good ship [illegible], at the Isthmus of Corinth.

[illegible] useless to speculate on the real character of the Argonautic expedition, even if it be more [illegible] myth. The accounts given by other [illegible] so widely, especially in the geographical [illegible] from those of Apollodorus, that it becomes [illegible] to determine satisfactorily whether the [illegible] sailed north, east, or west. The common [illegible] on of the legend is that Jason [illegible] of discovery, which had for its [illegible] the hope of new commercial relations [illegible] would modify this hypothesis, and [illegible] the enterprise was partly commercial, [illegible] piratical, and partly adventurous, and that [illegible] crew was in all probability composed of [illegible] restless, and ambitious spirits, who were [illegible] thing that might turn up.

STOLI, a seaport on the south-west of [illegible] and capital of the island. Its lat. is 38° [illegible] long. 19° 59′ E. Its pop. is 8000; and [illegible] long.

[illegible] Augustin, a prominent Spanish [illegible] modern liberal school. On the [illegible] out of the War of Independence in 1808, [illegible] to Cadiz, where he agitated for the organ[illegible] of a [illegible] cy along with a free constitution, [illegible] and of strengthening and consolidat- [illegible] and resources of the nation. In [illegible] ent as representative of his native [illegible] Cortes, where he was appointed one [illegible] of the committee to whom were [illegible] wing up of the plan of a new [illegible] and splendid talents as a public [illegible] won him the admiration of the liberal [illegible] used to term him the Spanish Cicero. [illegible] return of Ferdinand VII., A. fell a [illegible] reactionary spirit which ensued. On [illegible] 1814, he was arrested and impris- [illegible] he displayed such dexterity [illegible] le to convict him. Differ- [illegible] ased five successive times, but they could not agree in their decision. At last the monarch himself passed sentence, which was, that A. should be confined for ten years in the prison at Ceuta. He was not, however, alone in his misfortunes. Fourteen persons were condemned along with him, amongst whom was his friend Juan Alvarez Guerra. In their confinement they experienced such barbarous treatment, that in four years three died, two became mad, and the rest received grievous injuries. The revolution of 1820 restored them to freedom. A. became Minister of the Interior, but soon resigned, in consequence of the king complaining of the weakness of the executive. Although provoked beyond measure by the narrow bigotry of the court, he did not rush into extremes, but continued a constitutional liberal to the end of his life. In the Cortes held at Seville in 1823, he voted for the suspension of the royal power; but after the violation of the constitution, he fled to England, where he remained till the amnesty of 1832. On his return to Spain, being nominated to the Cortes, he was repeatedly made president and vice-president of the Chamber of Deputies, and always shewed himself a moderate but unwavering reformer. In July 1841, on the discussion of the law regarding the sale of church property, he delivered himself strongly against all concordats with the pope. Next to Espartero, he was the most popular man in the kingdom with the enlightened party. During the regency, he was appointed guardian to the young queen, Isabella, but died soon after, on the 23d of March 1844, at Madrid. In his old age, he still exhibited the fiery eloquence that marked his youth.

ARGUMENT (Lat. *argumentum*), in Logic, means properly the ground or premiss on which a conclusion is rested; popularly, it is applied to a series of arguments, or to a controversy. *Argumentation* is reasoning put into regular shape, with a view to convince or silence an objector. Logicians have given distinctive names to various kinds of arguments. Thus, we have the *Argumentum ad hominem*, which is no real proof, but only an appeal to the known prepossessions or admissions of the persons addressed. In this style, when a man upholds one method of fraud, he may, by an appeal to his consistency, be driven to uphold another. The A. *ad veritatem*, again, has no regard to anything save objective truth. Next we have the A. *e consensu gentium*, or an appeal to the common belief of mankind, which, of course, may be used to prove or disprove anything. The A. *a tuto* rests upon the supposed safety or prudence of adopting a certain conclusion. It is sometimes used by Roman Catholics against Protestants in the following form: Protestants teach that salvation is possible in any church; this is denied by Catholics; therefore, it is safer to belong to the Catholic Church, as even the Protestant admits that a man may be saved in that church. Lastly, the *Argumentum a baculo* (or use of the cudgel), though objectionable, is concise in its style, and has settled many controversies.

ARGUME'NTUM AD HO'MINEM. See Argument.

A'RGUS, the son of Zeus and Niobe, succeeded Phoroneus in the government of the Peloponnesus, which took from him its name of Argos, as did also the territory of Argolis.—A., surnamed Panoptes (all-seeing), had one hundred eyes, some of which were always awake. He was enormously strong, and on account of the wonderful exploits he performed, Juno appointed him to watch over Io, transformed into a cow. Mercury being commissioned by Zeus to carry off the cow, slew A. by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then beheaded him. Juno

used the eyes of A. to decorate the peacock's tail.—A. the builder of the ship *Argo* (see ARGONAUTS).

A'RGUS, a genus of gallinaceous birds, remarkable for magnificence of plumage. The only known species is *A. giganteus*, formerly called *Phasianus A.*, and still very generally the A. pheasant. The sides of the head and of the neck are destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated; the secondary feathers of the wings are much longer than the primary. The name A. has allusion to the many beautiful eye-like

Argus Pheasant (*A. giganteus*).

markings which adorn the plumage of the male, and particularly the secondaries of the wings. The long secondaries are said to impede the flight of the bird; but its wings are much employed to aid it in running. The female is of comparatively tame plumage, not only wanting the eye-like markings, but even the great length of the secondaries and of the middle tail-feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl, but the tail-feathers of the male are nearly four feet long. The A. is a native of Sumatra and other eastern islands, of the peninsula of Malacca, Siam, &c. It is said to be found even in the northern parts of China. It is impatient of confinement, and has very seldom been brought alive to Europe.

ARGY'LE, ARCHIBALD CAMPBELL, MARQUIS OF, an eminent political character of the 17th c., was born in 1598, and succeeded to the earldom of A. in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war. In the General Assembly at Glasgow, in November 1638, he openly took the side of the Covenanters, and thenceforth became recognised as their political head. In 1640, he commanded a military expedition through Badenoch, Athole, Mar, and Angus, for the purpose of enforcing subjection to the Scottish Parliament. On the king's visit to Scotland, in 1641, he found it convenient to shew peculiar favour to A., and created him a marquis. On the breaking out of hostilities, A. was still desirous for negotiation, but was finally compelled to take the field. In April 1644, he dispersed the royalist forces under the Marquis of Huntly, in Aberdeenshire. He was less successful in withstanding the genius of Montrose, who, on the 2d February 1645, almost [illegible] his army at Inverlochy. His estates had much in the preceding year from the [illegible] the brilliant Cavalier, that a sum of [illegible] was voted for his support. In A[illegible] went to London, with Loudon [illegible] to treat with the parliament for a [illegible] the articles presented to the king. [illegible] the same time the bearer of a secret [illegible] from the king to treat with the Duke of [illegible] and the Marquis of Hertford, on the [illegible] a Scottish demonstration in favour of Charles. the defeat of the 'Engagement' [illegible] to [illegible] he had been decidedly opposed. of Scotland devolved on A. and terian leaders. In the parli[illegible] 1649, Charles II. was proclaimed [illegible]. on the 1st of January 1651, A. [illegible] on his head. At this time, it was [illegible] the complaisant monarch intended to [illegible] of his daughters. As head of the Co[illegible] Estates, A. took vigorous measures to op[illegible] well's invasion of Scotland, and still adhered [illegible] king, after the subjugation of the country. [illegible] the battle of Worcester, he [illegible]ed to Inve[illegible] where he held out for a year [illegible] C[illegible] troops. Falling sick, he was take[illegible] General Dean. He refused submissio[illegible] tector, but took an engagement to live [illegible] which he strictly kept. On the Res[illegible] paired to Whitehall, encouraged by a [illegible] from the king to his son. ARGYLESHIRE (*Airer-Gaedhil*, territory of the Gael), an extensive maritime county in the West of Scotland, including numerous islands, and a large mainland tract, cut up into many peninsulas by arms of the sea. It is bounded, N. by Inverness-shire; W. and S. by the sea; E. by Perthshire, Dumbarton, Loch Long, and Firth of Clyde. Its greatest length is about 115 miles; its greatest breadth, about 60 miles; its extent of coast-line is very great, amounting to 663 miles, owing to the indentation of the coast by numerous lochs running inland. Next to Inverness, it is the largest county in Scotland—area, 3210 square miles, of which 1063 are occupied by the numerous islands. No part is above 12 miles from the sea or from large inland lochs. The county is divided into the districts of Cantire, North and South Argyle, Lorn, Appin, Cowal, Morven, and Sunart. The chief islands are Mull, Islay, Jura, Tiree, Coll, Lismore, and Colonsay. There are upwards of thirty other islands of smaller size. The general aspect of A. is wild and picturesque, marked by rugged and lofty mountains, deep inland bays, and often precipitous coasts. Some fertile valleys exist. The north part is entirely mountainous, and presents some of the grandest scenery in Scotland, as Glencoe. The highest peaks are (Ord. Trig. Survey)—Bedan-ambran, 3760 feet; Ben Cruachan, 3668; Buachael Etive, 3341—all in Lorn; Ben Ima (end of Loch Long), 3319; Ben More (Mull), 3174; Ben Creach (Morven), 2790; North Pap of Jura, 2567. The chief bays are (going south)—Loch Moidart, Loch Sunart, Linnhe Loch, branching off into Loch Eil and Loch Leven, Loch Fyne, and Loch Long. There are no rivers of any size. The streams are short and rapid, the principal being the Urchvy, running through Glenorchy into Loch Awe, and the Awe connecting that lake with Loch Etive. The inland or fresh-water lochs are Loch Awe and Loch Lydoch. The rocks of A. are mica-slate, which predominates on the mainland; trap in Mull and Lorn; quartz rock in Islay and Jura; granite around Loch Etive and in Knapdale; patches of lias and oolite in many of the isles; and a little old red sandstone west of Loch Fyne and in South Cantire. Lead-mines occur at Strontian (where the mineral Strontianite was discovered, and from which the names of the earth called *Strontia* and the metal *Strontium* are derived), at Tyndrum, and in Islay and Coll. A copper-mine exists in Islay. The Easdale and Ballachuliah quarries supply the best roofing-slates in Scotland. Coal occurs near Campbelton; fine marble in Tiree, &c.; excellent granite near Inverary; and limestone in most parts of the county. The fertile parts of A. lie along the arms of the sea and the mountain streams. The soil is mostly a light, sandy, and gravelly loam, along the coast and the sides of rivers, and gravelly, with a till bottom, on the hillsides. Sheep and cattle rearing are the chief occupations of the farmer. More sheep are reared in A. than in any other Scotch county, and nearly a million acres are in permanent pasture. In number of cattle, A. yields only to the counties of Aberdeen, Ayr, and Perth. In 1872, A. had 24,246 acres under corn, and 12,305 under green crops, as well as 54,967 acres under permanent pasture, exclusive of heath or mountain-land. A. abounds in deer and game. Loch Fyne is famed for its herrings. Loch Awe abounds in salmon and trout.

In many parts of A. the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with the commercial centre of Scotland. The manufactures are unimportant, the chief being whisky, in Campbelton and Islay, and coarse woollens for home use. The chief towns and villages are Inverary, Campbelton, Oban, Duncon, Appin, Lochgilphead, and Tarbert. The three former unite with Ayr and Irvine in

returning one member to parliament; the county returns another. Pop. in 1871, 75,679, represented as mostly using the Gaelic language. This exhibits a considerable decrease since 1831, which has chiefly resulted from emigration. This extensive county is divided ecclesiastically into not more than fifty parishes, which contain only two royal burghs, Inverary and Campbeltown, the former of which is a station of the Circuit Court of Justiciary. The principal proprietors are the Duke of Argyle, the head, and the Marquis of Breadalbane, a branch of the Campbell family. Among the antiquities of A. are the ruins of Iona and Oronsay, and many *duns*, or circular forts, along the coast. In Cantire formerly lived the Macdonalds, or Lords of the Isles, whose power was weakened by James III.

ARIA (AIR), in Music, a rhythmical song, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. ARIETTA, a short melody. ARIOSO, a passage in the style of the A., often introduced into recitative. A. BUFFO, a comic song, &c.

ARIA'DNE, daughter of Minos, king of Crete, by Pasiphaë. When Theseus, with the offerings of the Athenians for the Minotaur, landed in Crete, A. conceived a passion for the beautiful stranger, and gave him a clew by means of which he threaded the mazes of the labyrinth, and was enabled to slay the monster. For this service, Theseus promised to marry her, and she escaped with him, but was slain by Diana on the island of Naxos. —According to another tradition, A. was left by Theseus at Naxos, where she was found by Bacchus returning from his triumph in India, who was captivated by her beauty, and married her. At her death, he gave her a place among the gods, and suspended her wedding-crown as a constellation in the sky. A., as left forsaken by Theseus, and as married to Bacchus, has been a favourite subject with artists.

ARIA'LDUS, a deacon of the church of Milan, who flourished during the 11th c. He took a prominent part in the ecclesiastical contentions of his times. The Catholic Church in the north of Italy was then very corrupt, a wide-spread licentiousness, originating from the unnatural institution of priestly celibacy, prevailed. Great numbers of the clergy kept concubines openly. Such as looked earnestly in those days at this flagrant evil, were disposed to consider the strict enforcement of celibacy the only effectual cure. Chief among these reformers stood A., whose life was one continued scene of violent controversy. Although successively sanctioned by Popes Stephen X., Nicholas II., and Alexander II., he found little sympathy among his brethren, and used to complain that he could only get laymen to assist him in his agitation. Having at length succeeded in obtaining a papal bull of excommunication against the Archbishop of Milan, a fierce tumult ensued in the city, whose inhabitants declared against A. and his coadjutors. A. now fled to the country; but his hiding-place being betrayed, he was conveyed captive to a desert isle in Lake Maggiore, where he was murdered by the emissaries of the archbishop, and his remains thrown into the lake, June 28, 1066. He was afterward canonised by Pope Alexander II.

ARIA'NA. See ARYAN RACE.

A'RIANS. See ARIUS.

A'RIAS MONTA'NUS, BENEDICTUS, a Catholic divine noted for his great linguistic attainments, was born, 1527, in the village of Frexenal de la Sierra, situated amongst the mountains separating Estremadura from Andalucia. He studied first at Seville, and afterwards at Alcalá de Henares, where he distinguished himself by the ardour he manifested in the acquisition of the oriental languages, Arabic, Syriac, and Chaldee. He next proceeded on a tour through Italy, France, Germany, England, and the Netherlands, in the course of which he obtained a knowledge of various modern tongues. He was present at the celebrated Council of Trent; but on his return to his own country, he resolved to retire into seclusion, and dedicate his whole time to literature. In 1568, however, Philip II. persuaded him to repair to Antwerp and superintend the publication of the famous edition of the 'Polyglot Bible,' executed in that city at the suggestion of the printer, Christopher Plantin. After four years' labour, the work was issued under the title *Biblia Sacra, Hebraice, Chaldaice, Græce, et Latine, Philippi II. Regis Catholici Pietate et Studio ad Sacrosanctæ Ecclesiæ Usum Chph. Plantinus excudebat.* It was received with universal applause. The Jesuits, to whom A. was sincerely and strenuously opposed, alone attempted to fasten the charge of heresy on the author, who made several journeys to Rome to clear himself of the accusation. Philip II. rewarded him with a pension of 2000 ducats, besides bestowing on him various other emoluments. He died at Seville in 1598. His literary works are very numerous. They relate principally to the Bible and to Jewish antiquities; but he also wrote a poem on Rhetoric, and a History of Nature.

ARI'CA, a seaport of Moquega, the southerly department of Peru, in lat. 18° S. long. 70° 24′ W. Though it has merely a it affords safe anchorage to shipping, of the chief outlets of the trade of Boli connected with La Paz in that republic by path which leads across the west Co Andes. Its exports mostly consist of alpaca, wool, and guano. A. has fre fered from earthquakes; a most occurred in 1868. In 1872, 222 v tons, entered this port, and 221, v 257,024, cleared it. The climate is salu thermometer ranging from 86° F. in summer, in winter.

After the …the cardinal, the duke, his brother, … post to his service, and acted to him with great kindness and liberality. In the early part of 1521, a second edition of his poems was published, the *Orlando Furioso* being still in forty cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain-district of Garfagnana; a task which seems more like a punishment than a mark of honour. A., however, succeeded in this arduous undertaking; and after remaining three years governor of the quarter, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies. It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in the latter part of 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of forty-six cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he died on the 6th of June 1533, in his fifty-ninth year, and was buried in the church of San Benedetto, at Ferrara, where a magnificent monument indicates the resting-place of his remains. A. is described as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo, the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland, stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story of this lady being left unfinished in the *Orlando Innamorato* is taken up by A., who makes her fall in love herself with an obscure juvenile squire, on which Orlando gets furious, and long continues in a state of insanity. Besides his great work, A. wrote comedies, satires, sonnets, and a number of Latin poems, all more or less marked with the impress of his genius. In 1845, Giamperi, a librarian of Florence, announced that he had discovered at Argenta, near Ferrara, an autograph manuscript by A., containing a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins against the Saracens. The manuscript had been mutilated, and contained in a complete form only the cantos 3, 4, 5, while 2 and 6 were imperfect; and it was stated that the entire poem had consisted of twelve cantos. The work was published under the title *Rinaldo Ardito di L. Ariosto, Frammenti Inediti Pubblicati sul Manuscritto Originale* (Florence, 1846). In genius and style, it has been found by critics by no means to accord with the *Orlando*. Of the *Orlando* there are three several translations into the English language: the first, by Sir John Harrington, appeared in the year 1634; the second, by John Hoole, in 1783; and the third by W. Stewart Rose, in 1823 and following years. In the last only is there to be found a fair representation of the feeling and spirit of the original.

ARIOVISTUS (probably the Latinised form of the German *Heer-fürst*, army-prince), a German chief, leader of the Marcomanni and other German tribes, was requested by the Sequani, a Gallic people, to assist them in a contest against the Ædui. Having gained a victory for the Sequani, A. was so well pleased with their fine country (now Burgundy), that

he and his followers determined to abide there. Many other Germans followed him into Gaul, where he soon collected an army of 120,000 men. The Gallic people turned now for help towards the Romans, and Cæsar demanded an interview with A., who proudly replied, that 'he did not see what Cæsar had to do with Gaul.' After another message from Cæsar had been treated in the same scornful manner, the Roman forces under Cæsar advanced and occupied Vesontium (now Besançon), the chief city of the Sequani. A furious engagement took place (58 B.C.), in which Roman discipline prevailed over the German forces, which were utterly routed. A., with only a few followers, escaped over the Rhine into his own country. His subsequent history is unknown.

ARI'SPÉ, the capital of Sonora, the extreme north-west department of the Mexican Confederation. It is situated in the Sierra Madre, the western range of the Rocky Mountains, on the banks of the Sonora, which is said to lose itself in an inland lake. Its population has been estimated as high as 7600. The surrounding district abounds in the precious metals, as also in cotton, wine, grain, and live-stock.

ARI'STA AND ARI'STATE. See AWN.

ARISTAE'US (from a Greek word signifying *the best*), an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo and Cyrene, the latter the grand-daughter of Peneius, a river-god of Thessaly. She is said to have given birth to A. on the coasts of Libya, in Africa, whence the region is alleged to have derived its name of Cyrenaica. Hermes placed the child under the protection of the Horæ, the fosterers of cities, culture, and education. According to another tradition, A. was the son of the nymph Melissa, who fed the infant with nectar and ambrosia, and afterwards intrusted his education to Chiron. The great diversities in the legend were probably caused by the fusion into one of separate local divinities, whose functions were similar, and whose histories were, in consequence, carelessly commingled. After A. left Libya, he went to Thebes, in Bœotia, where he was taught by the Muses the arts of healing and prophecy, and where he married Autonoë, the daughter of Cadmus, by whom he had several children. After the unfortunate death of his son Actæon (q. v.), he went to Ceos, where he liberated the inhabitants from the miseries of a destructive drought by erecting an altar to Zeus *Icmæus*—i.e., the rain-maker. He now returned to his native land; but shortly after, set out a second time on a voyage of beneficence. He visited the islands of the Ægean Sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. At last he went to Thrace, where he was initiated in the mysteries of Dionysus; and after a brief residence in the vicinity of Mount Hæmus, he disappeared from the earth.

This myth is one of an extremely pleasing character, from the invariable beneficence which is attributed to A. It is less disfigured by anthropopathic errors than most of the myths of Greek divinities. A. was especially worshipped as the protector of vine and olive plantations, and of hunters and herdsmen. He also trained men to keep bee-hives, and averted the burning heats of the sun from the open fields. Later mythology often identified A. with the higher gods Zeus, Apollo, Dionysus.

ARISTA'RCHUS, OF SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 281–264 B.C. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon. In this he shews the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half luminous. It will be obvious from a glance at the annexed figure that the three bodies must then form a right-angled triangle, of which the moon is at the right angle. The angle MES, then, being observed, it is easy to find the ratio between EM and ES. This is quite correct in theory; but the impossibility of determining when the moon is exactly half-illuminated, renders the method useless in practice. Besides, in the days of A., there were no instruments for measuring angles with anything like accuracy. A. estimated the angle at E at 83°, and determined EM to be $\frac{1}{20}$ of ES; the truth being that the angle at E differs only by a fraction of a minute from a right angle, and that EM, the distance of the moon from the earth, is about $\frac{1}{400}$ of ES, the distance of the sun. According to some accounts, A. learned from the Pythagorean school, that the earth moves round the sun; but this seems to be a mistake. Vitruvius speaks of A. as the inventor of a kind of concave sun-dial.

ARISTARCHUS, OF SAMOTHRACE, a grammarian, who lived, about 150 B.C., in Alexandria, where he founded a school of grammar and criticism, and educated the children of Ptolemy Philometor. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets, especially of Homer. The form in which we now have the Homeric poems preserved is in a great degree owing to his judgment and industry. The soundness of his critical principles has made his name a general term for a severely just and judicious critic. Being afflicted with an incurable dropsy, he terminated his life by voluntary starvation at the age of 72. The fragments of his writings that have been preserved are to be found scattered through the Scholia on Homer, first published by Villoison (Venice, 1788).

ARI'STEAS, an entirely fabulous character, who may be styled 'the Wandering Jew' of Greek tradition in ancient Greece. First we hear of him teaching Homer; then, some ages after, he was born at Proconnesus, an island in the Sea of Marmora. It is stated that having visited the Arimaspæ, the gold-watching griffins, and the Hyperboreans, he died on his return home; but, soon afterwards, a traveller declared that he had been met and accosted by A. The neighbours searched the house where A. was supposed to be lying, but it was empty. Seven years afterwards, he appeared as author, and wrote a poem entitled *Arimaspeia*, in three books, giving accounts of Northern and Central Asia, which were copied by Herodotus and others. After thus establishing himself, he vanished again; and after 340 years he reappeared at Metapontum, where he advised the people to build Apollo, and an altar to [illegible] ing them that, when Apollo visited Metapontum (A.), in the form of a raven, he had assisted in the ceremony. The controversy of the Christian Church, has often quoted this tale of A. as a counterpart to the miracles recorded in the New Testament.

in clear from the saying of his opponent,
declared that 'A. was the only man he
. . **could wear with equal grace both fine**
and rags.' Diogenes Laertius records a
of his *dicta*, some of which take the form
sets, and indicate a sharp, cutting, lively,
f-complacent nature. A. also lived at
in intimacy with the famous courtesan
Lais, but towards the close of his life, he is supposed to have retired to Cyrene. His daughter Arete seems to have been a person of superior abilities, inasmuch as her father imparted his leading doctrines to her, and she to her son, A. the Younger (hence called *Metrodidaktos*, 'taught by the mother'), by whom they are supposed to have been systematised. A., in all probability, published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of the race.

The Cyrenaic school, all the teachers of which were probably imbued with the spirit of A., and merely carried out his doctrines to their legitimate results, professed a great contempt for speculative philosophy, and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony with the gay, self-possessed, worldly, and sceptical character of their master. The chief points of the Cyrenaic system were: 1. That all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and bad. 2. That pleasure consists in a gentle, and pain in a violent motion of the soul. 3. That happiness is simply the result of a continuous series of pleasurable sensations. 4. That actions are in themselves morally indifferent, and that men are concerned only with their results. Wieland in his historico-philosophical romance, *Aristipp und einige seiner Zeitgenossen* (A. and Some of his Contemporaries), presents us with a charming picture of the life and opinions of the great philosophic sensualist, who stood out in strong relief against the gloom and austerity of Antisthenes and the Cynical school. See Wendt's *De Philosophiâ Cyrenaicâ* (Gott. 1842).

ARISTOBULUS, an Alexandrian Jew who lived under Ptolemæus Philometer about 175 B.C., and was considered by the early Fathers as the founder of the Jewish philosophy in Alexandria. He was long considered the author of the *Exegetical Commentaries on the Books of Moses* which went under his name, but it is now admitted that the work in question was the composition of a later period. Only fragments of it remain. It was intended to shew that the oldest Greek writers borrowed from the Hebrew Scriptures; and to support this theory, numerous quotations were professedly taken from Linus, Musæus, Orpheus, &c., of which the Christian apologists made abundant use. These, however, have long been considered forgeries, inasmuch as they do not exhibit a trace of the antique Greek spirit, but make the writers speak in the tone and style of the Old Testament. See Valckenaer's treatise, *De Aristobulo Judæo* (Leyden, 1806).

ARISTOCRACY (Gr. *aristocratia*, from *aristos*, best, and *kratos*, power) means etymologically the power or government of the best, noblest, or most worthy; and in the sense which it originally bore, A. had reference not to a social class, but to a form of government in which the sovereignty was placed in the hands of a minority of the citizens of the state, exclusive altogether of the slave population, which generally existed in antiquity. It is in this sense also that we use it when we speak of the Italian states of the middle ages as aristocracies. In order to constitute an A., it was further necessary that the minority which composed it should consist of the highest class, in point not of wealth alone, but of birth and culture; the government of a minority in numbers simply, being known by the more odious name of an *oligarchy*. Were the whole government

of England intrusted to the House of Lords, even though that body were to become vastly more numerous than it is, so long as it did not include half of the whole adult males, and were not elective, but hereditary, we should be ruled by an A., and our rulers would be aristocrats in the antique sense of the term. In this, its political sense, the term A. has never been acclimatised in England, because the thing which it signifies has always been unknown. Our territorial nobility, though possessing great influence in the government of the country, has, at every stage of its career, been controlled either by the Crown from above or the Commons from below; and thus it is that, though more important as a social influence than in any other country, the English A. has never assumed the form of a ruling-class. When used with reference to English society, the term A. has two significations—a narrower and a wider one. According to the first, it is nearly synonymous with *nobility*. In this sense, it will be treated of under that head, and its relative subdivisions. According to the second, it is synonymous with *gentry*, and includes the whole body of the people, titled and untitled, above a certain very indefinite social line. Perhaps the nearest approximation which we shall make to a definition of A. in this, its proper English sense, will be by adopting that which Aristotle has given not of *aristocratia*, but of *eugeneia*, or good birth. 'Good birth,' he says, 'is ancient (long inherited) wealth and virtue.' (*Politic.* lib. iv. c. 7.) The question as to the extent to which either of these qualities is requisite to constitute a claim to admission into the ranks of the A., is one to which probably not two persons, either within or without the pale, would return the same answer; but that the absence of either would be a ground of exclusion, is a point on which there will be little difference of opinion. No amount of mere wealth will, in general, confer it either on a tradesman or his immediate descendants (see GENTLEMAN); and scarcely any deeds, however noble, will give it to him who is not the possessor of inherited fortune. Neither Burns the gauger, nor Shaw the life-guardsman, has ever been regarded as an aristocrat, though nobody denies that the one was a poet, and the other a hero. But when the claim to recognition as an aristocrat has been inherited, it will scarcely be lost by the individual himself, however adverse may be his worldly circumstances, or however ignoble his conduct; and it is not difficult to imagine an elevation of moral tone which would confer it even on a beggar.

ARISTOGEI'TON. See HARMODIUS AND ARISTOGEITON.

ARISTOLO'CHIA, a genus of plants of the natural order *Aristolochiaceæ* or *Asarineæ*. This order, which is dicotyledonous or exogenous, consists of herbaceous plants or shrubs, often climbing shrubs, and contains upwards of 130 known species, chiefly natives of warm climates, and particularly abundant in the tropical regions of South America. The leaves are alternate, simple, stalked, often with a stipule; the flowers axillary, solitary, hermaphrodite, of a dull colour; the perianth at its base adhering to the ovary, tubular, sometimes regular, but generally very irregular; the stamens 6—12, epigynous (or inserted upon the ovary), distinct, or adhering to the style; the ovary is generally six-celled, with numerous ovules; the style simple, the stigmas radiating, as numerous as the cells of the ovary; the fruit dry or succulent; the seeds with a very minute embryo at the base of fleshy albumen. —The genus *A.* is distinguished by a tubular oblique perianth, generally inflated at the base, the mouth dilated on one side, and by stamens adherent to the style, so that it is included in the Li class *Gynandria*. The species are mostly sh and natives of tropical countries, some of climbing to the summits of the loftiest trees. S are found in the south of Europe; one onl common BIRTHWORT (*A. Clematitis*), occurs up continent as far north as about lat. 50°, an doubtful native of England. It is a perennial with erect, naked, striated stem—heart-shaped green leaves on long stalks—the flowers stalke growing to the number of sometimes seven to from the axils of the leaves, the tube of the pe about an inch long, and of a dirty yellow c It grows chiefly in vineyards, hedges, abou borders of fields, among rubbish, and in places. Knights or *Horsemen*. It was the first
met produced in his own name, and
boldness of the author. It
is levelled against Cleon, and presents us with a striking picture both of a vulgar and insolent charlatan, and of the fickle, cunning, credulous, and rather stupid mob over whom he precariously despotises. It is related of this piece that, when no actor would undertake to play the part of the influential Cleon, A. himself impersonated the demagogue. Unfortunately for the character of Cleon, as well as that of the Athenian democracy, these caricatures and misrepresentations of A. have been received as historical pictures. How far they are from the truth, has been clearly shewn by Grote in his *History of Greece*. See CLEON. In 423, A. produced the *Clouds*, which, along with the *Knights*, are the two most famous of his comedies. They exhibit in overflowing richness that fancy, wit, humour, satire, and shrewd insight which characterise this greatest of all Greek comic writers. The *Clouds*, however, displays at the same time the weaknesses and limitations of A.'s mind. Its aim was to deride the pretensions of the new sophistical school, and to point out its pernicious tendencies. So far well. But A., who was no philosopher, demonstrates his own incapacity to appreciate the highest range of thought and character, by selecting no less a person than Socrates as the most perfect representative of a sophist. A., who was both religiously and politically conservative, had apparently no clearer conception of abstract truth than is involved in reverence for the sanctities of the past, the old gods, old traditions, old manners, and old sentiments. He had an instinctive hatred of innovations, and considered all equally pernicious. As he had represented Cleon the reformer as a vulgar innovator and demagogue, ruled by the lowest considerations, he makes the innovating views of Socrates also proceed from corrupt motives, veiled perhaps with more craft. Alcibiades is caricatured in this brilliant comedy as a wildly extravagant youth, whose career of ruin is accelerated by the insidious instructions of Socrates; and a hint is thrown out towards the end of the piece, which unfortunately proved to be the 'shadow' of a 'coming event.' A. represents the father of Alcibiades as about to burn the philosopher and his whole *phrontisterion* (subtlety-shop); and there can be little doubt that this dramatic vilification of the purest of heathen moralists led to that persecution which, twenty years later, culminated in his condemnation and death. In 422 appeared the *Wasps*, still extant, in which the popular courts of justice are attacked; and three years later, in his *Peace*, he returns to the subject of the Peloponnesian war, which is ridiculed with great cleverness. In 414 he produced two comedies, *Amphiaraus* and the *Birds*, both of which caricature, in the liveliest manner, the Sicilian expedition, then being meditated, but which proved so utter a failure. The *Lysistrata* belongs to the year 411, and exhibits a civil war of the sexes, as the monstrous issue of that in the Peloponnesus. In his *Plutus* and *Ecclesiazusæ*, which respectively appeared in 408 and 392, true to his mission as the enemy of innovation, he assailed the new passion for Doric manners and institutions, and ventured to ridicule Plato, in that, however, in which the philosopher is weakest—namely, his political theory. Euripides, also, as the sophist among poets, is severely handled in the *Frogs*, which belongs to the year 405.

A. wrote fifty-four comedies, of which only eleven are extant. He is acknowledged to stand far above all his contemporaries or successors of the middle and new comedy in wealth of fancy and beauty of language. His choruses sometimes exhibit the purest spirit of poetry; and Plato himself says that the soul of A. was a temple for the Graces. The

ingenuity which he displays in the mechanical artifices of verse is not less wonderful. Frogs are made to croak choruses, pigs to grunt through a series of iambics, and words are coined of amazing length—the *Ecclesiazusæ* closes with one composed of 170 letters. It only remains to be added, what might naturally be expected, that the personalities in which A. indulged descend at times into coarseness and indecency, and that even the gods whom he undertook to defend are treated with levity, and placed in the most ludicrous lights.

The comedies of A. have been edited by Brunck (1781—1783), Dindorf (1794—1826), Bekker (1829). They have all been translated into German by Voss (Brunswick, 1821), and there are several translations of single plays into English.

ARISTOTE'LIA. See MAQUI.

A'RISTOTLE was born at the Grecian colonial town of Stageira, on the west side of the Strymonic Gulf (now the Gulf of Contessa, in Turkey in Europe), in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nikomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the Great. A. lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stageira. It is to be conjectured that his education, such as it was, would take the direction of preparing him for the family profession, and that whatever knowledge and power of manipulation attached to the practice of physic at that time, would rank among his early acquisitions. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stageira for Athens, then the intellectual centre of Greece and of the civilised world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life, connecting him as political adviser with the two successive Syracusan despots—Dionysius the Elder, and Dionysius the Younger—and with Dion. A., therefore, pursued his studies by books, and by the help of any other masters he could find, during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. The expressions said to have been used by Plato imply as much; for we are told that he spoke of A. as the 'Intellect of the School.' Unfortunately, there is a total absence of particulars or precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing, he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the Dikasteries, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that A. would look with contempt upon the shallowness—in all that regarded thought or subj
common rhetorical teaching, of wh
prevailing excellence would lie in the form of
address, being artistic rather than profound
erudite. One of the disciples of Isocrates,

autumn of the same year, he died, aged 62. He
long been afflicted with indigestion, and ulti-
ly sank under this malady.

philosophy of A. differed from that of Plato on
ints, especially in the fundamental doctrine
Theory of Ideas. The Platonic 'ideas'
were conceived as real existences, impart-
at is common to the particular facts or
instead of being derived from them by an
of the mind. Thus, the actual circles
derive their mathematical properties from
existing 'idea,' or circle in the abstract;
ctual men owe their sameness to the ideal man.
was opposed to this doctrine throughout, although
always speaks of its author with respect, and
imes with affection. The whole method of A.
marked contrast to the Platonic handling of
hical subjects: he was a most assiduous
r and collector of facts, from which he drew
s with more or less accuracy. Plato, on
and, valued facts merely in criticising the
s he was bent upon demolishing, and not
of establishing sound theories.

tings of A. may be said to have embraced
e circle of the knowledge of his time. Many
s are lost; those that remain refer principally
following departments.

nomy, Mechanics, Physics, were treated
at some length; but here his failure
ete, if we look at his writings from
of view now acquired. He was the
capricious fancies, based upon doctrines
among his contemporaries, accepted by
rinciples of reasoning, and conducting him
most unsound conclusions. His theory of
ion of the sphere, the necessary perfection
r motion, of the impossibility of a vacuum,
like, did more to confuse than to explain
nomena of nature. Nor can it be said that
was not ripe for putting these subjects on a
basis; for he was very shortly followed by
of men, who both observed and reasoned
especting them, and laid the foundation of
subsequent progress namely, Euclid,
, Archimedes, Eratosthenes, and Hippar-

fteen books called Metaphysics contain
sound thought, but are obscure and de-
arranged; indeed, neither the actual
t of the books, nor the title which they
e ascribed to A. himself. The subject to
ey are devoted is Ontology—the science
quatenus Ens—which he terms *Philosophia*
and sometimes Theology. He distinguishes
anches of theoretical philosophy. 1. Physics
dy of sensible material particular things,
which differs from every other, and all of
have in themselves the principle of change
otion. 2. Mathematics that of geometrical
numerical entities, known by general definitions,
not neither of change nor of movement,
being considered and reasoned upon apart
r, but not capable of existing apart
3. The First or Highest Philosophy—
the essences of things eternal, un-
ible, and apart from all that change, move-
and differentiation which material embodi-
involves.

he Metaphysics, or First Philosophy, does in fact deal with the extreme abstractions or generalities of all sciences. It is a collection, partly of doubts and difficulties, partly of attempted solutions, upon these last refinements of the human mind. It includes many valuable comments on the philosophy of Plato and others anterior to or contemporary with A. The general terms and subtle distinctions which this treatise first brought to view, were highly prized throughout all the philosophy of the middle ages.

He appears in a very different light in his great work on Animals. He has here amassed a stock of genuine observations, and also introduced a method of classification which continues to this day as the most approved groundwork of zoological classification. In this work we see perhaps in the most advantageous light, the two great qualities of his mind, rarely coupled in the same individual the aptitude for observation, and logical method. The excellence shewn in his various writings generally depends upon one or other of these qualities.

His Organon or Logic is his complete development of formal reasoning, and is the basis and nearly the whole substance of syllogistic or scholastic logic. This science he almost entirely created. Mr Grote observes (*History of Greece*, part ii. chap. lxviii.) that 'what was begun by Socrates, and improved by Plato, was embodied as a part of a comprehensive system of formal logic by the genius of A.; a system which was not only of extraordinary value in reference to the processes and controversies of its time, but which also, having become insensibly worked into the minds of instructed men, has contributed much to form what is correct in the habits of modern thinking. Though it has now been enlarged and recast by some modern authors (especially by Mr John Stuart Mill in his admirable System of Logic) into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day—we must recollect that the distance between the best modern logic and that of A. is hardly so great as that between A. and those who preceded him by a century—Empedocles, Anaxagoras, and the Pythagoreans; and that the movement in advance of these latter commences with Socrates.'

A considerable portion of his writings relate to the Human Mind and Body. In one of these, a short treatise on Memory and Recollection, he gave the first statement of the laws of Association of Ideas.

His treatises on Rhetoric and Poetics were the earliest development of a Philosophy of Criticism, and still continue to be studied. The same remark is applicable to his elaborate disquisitions on Ethics.

Perhaps one of his greatest works is his Politics, based upon a collection made by himself of 158 different Constitutions of States; the collection itself being unhappily lost. Here we see the spirit of the inductive observer, which indeed is no less apparent in the works mentioned in the last paragraph. It is, however, a singular fact, that he gives no evidence of having read the historian Thucydides; and his only reference to Herodotus is on a point of natural history. Yet the narratives and descriptions contained in the works of both these writers are probably of as much value, and as much in point, in a Political Philosophy, as the very best observations made by himself.

The great current distinctions of Matter and Form, Substance and Quality, Actuality and Potentiality, are due to A. See Grote's *Aristotle*, 1872.

ARISTOXENUS, of Tarentum, a pupil of Aristotle's, and one of the oldest writers upon music, flourished about 330 years B.C. He was extraordinarily active and versatile in his literary studies, and is said to have composed upwards of 450 treatises

on music, history, and philosophy. On the death of Aristotle, he fully expected to be appointed his successor, and is said to have been deeply mortified when Theophrastus was preferred; but this statement is discredited by many. He founded a school of musicians, who were called after him, Aristoxeneans, and whose distinguishing characteristic was that they judged of the notes in the diatonic scale exclusively by the ear, while the Pythagoreans determined these mathematically. Except his *Elements of Harmony*, in three books, which we still possess, only a few fragments of his writings survive in later authors.

ARITHMETIC is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term A. to this art of reckoning, assigning the investigation of the principles to analysis.

Among the ancient Greeks and Romans, A. made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid (7—10 B. of the *Elements*), Archimedes, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th c., A. began to assume a new form; but it was not till the 16th c. that the Double Rule of Three, or Compound Proportion, was discovered, and decimal fractions were introduced. The invention of Logarithms in the 17th c. is the last great step in advance that the art has made. Passing over the elementary operations of Addition, &c., the chief heads, such as FRACTIONS, DECIMALS, PROPORTION, LOGARITHMS, &c., will be noticed in their proper places.

ARITHMETICAL MEAN is that number that lies equally distant between two others: thus, the A. M. between 11 and 17 is 14, which is found by taking half their sum.

ARITHMETICAL PROGRESSION is a series of numbers that increase or diminish by a common difference, as 7, 10, 13, 16, 19, 22; or 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, &c., form an A. P., of which the difference is 1.

ARITHMETICAL SIGNS are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. *Ex. gr.*, $7 + 5$ indicates that 7 and 5 are to be *added* together; $7 - 5$, that 5 is to be *subtracted* from 7; 7^5 that 7 is to be raised to the fifth *power*; $7 + 5 = 15 - 3$, that when 7 and 5 are added together, the result is *equal* to the difference between 15 and 3. The same signs are also used in Algebra; and an enumeration and explanation of them may be found in almost any treatise on Arithmetic or Algebra.

A'RIUS, the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been born shortly after the middle of the 3d c. About the year 306 A. D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these A. was largely mixed up. At first, he took part with Meletius, Bishop of Lycopolis, in Upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, Bishop of Alexandria; but afterwards he became reconciled to the latter, who made A. a deacon. The reconciliation, however, was brief. A. once more took the part of Meletius, and was excommunicated by Peter in consequence; b latter dying soon after, Achillas, his suc restored A. to his office, and even advanced the dignity of a presbyter, 313 A. D. His ne tion required that he should interpret the Sc and, as he possessed an abundance of na united with great learning, it is not w his preaching should have become po peculiarities of opinion been vehemen The first time, however, that A. was in collision on a point of doctrine with his eccles superiors, was in 318 A. D. Alexander, Bis Alexandria, and successor of Achillas, havin public assembly of clergy, while speaking Trinity, said that it contained one su or indivisible unity of substance, A. such a conception was impossible to mind, and accused Alexander of Sabel of destroying the distinction of persons. pute grew hot, and a conference which was settle it only embittered the disputants. In taining his ground, A. went beyond his ment of the absolute distinctness of person the Father and the Son; he maintained th Son was not co-equal or co-eternal with the F but only the first and highest of all finite created out of nothing by an act of God's that he ought not to be ranked with

A. was successful in securing the ad numbers both of the clergy and laity in and Asia Minor. In 321 a synod of held at Alexandria. These deposed and excom cated A., and active measures were taken to h decision be known over all the Christian chu Alexander himself wrote numerous l rs (t which are still extant), exhorting the receive the 'heretic.' In consequence o steps, the breach was widened between To escape persecution, A. retired to Pal he wrote a letter to his friend Eusebius, Bishop of Nicomedeia, a city of Bithynia, fro from Constantinople. Eusebius, one of th influential Christians of his time, warmly sy with him; wrote in his behalf to Paulinus Tyre, and others; absolved him from drian synod's excommunication; and vened another synod in Bithynia, favourably on A. He even enlisted the side of the latter, to this extent the half-pagan emperor addressed both Alexander and A., assuring them in dispute was a trifling one, and ought voke a serious quarrel. While A. was res Nicomedeia, he wrote a theological work and prose, called *Thaleia*, some fr remain, and indicate an earnest mind, but at the same time contain e could not but pain a believer in Christ. The *Thaleia* is said to have by the Arian neophytes, who thus passions of their adversaries, and increa virulence of the contest. The comedians, pagans, took advantage of the occasion the Christian religion in the theatres. of the emperor in several cities wished this profane temerity, but the i created greater confusion.

It now became impossible for the remain neutral or indifferent, with ea self, or to the tranquillity of the empire. Bishop of Corduba, whom he had mediator betwixt Alexander and A., took the former, and reported unfavoura result was, that Constantine, in order to effect a final settlement of the qu the memorable Council of Nicæa

A. D. Three hundred and eighteen
[illegible] all parts of the Christian
[illegible]y from the east, were present,
[illegible] priests, deacons, and acolytes.
[illegible]d and defended his opinions.
[illegible] unambiguous manner that
[illegible] of God was created out of nothing; that
[illegible] not always existed; that he was not immut-
[illegible]er impeccable; that it was through his free-
[illegible]he remained good and holy; that if he had
[illegible]. he could as easily have sinned as not; in a
[illegible]it he was a mere creature and work of the
He further affirmed that the Son of God
[illegible]t of the same substance with the Father; that
[illegible]ot the 'Word' or 'Wisdom,' properly speak-
[illegible]d that the Scriptures only attribute these
to him as they do to other created intelli-
[illegible]. These propositions were listened to with
[illegible] calmness by the bishops, but the inferior
or at least a majority of them, manifested
[illegible]t violent opposition. The document con-
his confession of faith was torn to pieces
[illegible]is [illegible]s. Arguments, however, of a more
[illegible] were also employed. Alexander was
[illegible]d by the young deacon, Athanasius, the
[illegible] eloquence, and in the power of his logic.
[illegible]ally by the reasonings of Athanasius
[illegible]council was persuaded to define, in the
[illegible]ame manner, the doctrine of the Godhead—
[illegible] absolute unity of the divine essence, and the
[illegible]e equality of the three persons. All the
[illegible]subscribed it except two, Theonas of Mar-
and Secundus of Ptolemais, who had the
[illegible](for it must be considered such) to follow
[illegible] A. into Illyricum.

[illegible]edict was now issued commanding the
[illegible]s [illegible] to be burned, and threatening with
[illegible]nishment all who should be convicted of
[illegible]m. This change in the emperor's senti-
[illegible] importance of the doctrine at issue is
[illegible]d by some writers to his recognising the will
[illegible]n in the harmonious consent of so many
A[illegible]re probable explanation is, that he
[illegible]utmost social confusion from the col-
[illegible]ns, and resolved to crush that which
[illegible] youngest and the weakest, hoping
[illegible]remove the ground of disturbance. He
[illegible]ken, however. At Alexandria, the Arians
[illegible]in a state of open insurrection, and began
[illegible]themselves with other condemned sects, for
[illegible]ses of mutual defence. The great influence
[illegible] was also exerted on behalf of the exiled
[illegible] well as that of Constantia, the sister
[illegible]eror, who had herself embraced Arian
in 328, permission was granted him to
Illyricum. Constantine was very gra-
[illegible]m because he thought the chances of
[illegible]ng restored to the community were now
[illegible]for it had been represented to him by
[illegible]t the doctrines of A. did not essentially
[illegible]se of the Nicene Council. In 330 A. D.,
[illegible]rview with the emperor, and succeeded
[illegible]h[illegible]hat Eusebius had only spoken the
[illegible]an [illegible]confession of faith which he pre-
[illegible]declared his belief that the Son was born
[illegible]r before all ages, and that as the 'Word,'
[illegible]made all things both in heaven and earth.
emperor was satisfied, and sent orders to
[illegible]ius, now Bishop of Alexandria, to receive A.
communion of the church. This Athanasius
[illegible]a to do, and a series of tumults was the con-
[illegible]s. [illegible]bius was greatly irritated. He called
[illegible]s at Tyre, in 335 A. D., which pro-
[illegible]Athanasius. The emperor was even
[illegible]n to remove the latter to Gaul, though he
[illegible]as his reason, that he wished to deliver him
from the machinations of his enemies. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against A. and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius, and resolutely resisted every effort to establish the new opinions among them. Disappointed in his expectations, A., in 336 A. D., proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to Arius the holy communion on the Sunday following. This was considered a grand triumph by Eusebius and his friends, and when the day arrived, they escorted A., as a guard of honour, through the streets of the metropolis. When about to enter the temple in which it was intended that he should be received with solemn pomp, he retired a moment to relieve nature, but fainted, and died of a violent hemorrhage. His disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

A. was exceedingly handsome, but the harassing cares of a life spent in a continual struggle with his adversaries, is said to have given him a worn and haggard look. His manners were graceful and modest; he was noted for even an ascetic abstinence, and the purity of his moral character was never challenged by a single enemy. A. is said to have composed songs for sailors, millers, and travellers, in popular measures, for the purpose of spreading his peculiar tenets; but no traces of these survive.

After the death of A., his followers rallied round Eusebius, now Bishop of Constantinople (338), from whom they were styled Eusebians. The reconciliatory middle party of Eusebius of Cæsarea (died 340 A. D.), who wished to end the great controversy by abstaining from all strict dogmatic assertions on the matter, soon dwindled into insignificance between the two contending parties. Constans, who ruled the West after the death of Constantine (337), and Constantius, in the East, made an essay towards reconciliation; but it failed at the synod of Sardeis (347), where the occidental bishops gathered themselves round Athanasius in support of the *Homoousian* doctrine (identity or *sameness of substance*), while in a separate council at Philippopolis, the oriental bishops asserted the *Homoiousian* doctrine (implying merely *similarity of substance*). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having, by the death of Constans (350) and conquest over Magnentius (353), gained dominion over the west, the Arian cause, which he favoured, triumphed at the synod of Arelate or Arles (353) and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antinicæans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomœi, or Heterousians, asserted, in the boldest style, their doctrine of 'distinct substances.' The semi-Arians (a large majority in the Eastern Church) maintained the Homoousian doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the Apostate (361–363), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the west, Valentinianus I., Gratianus, and Valentinianus II.,

extended full toleration to both parties. Arianism, at last, was virtually abolished in the Roman empire, under Theodosius in the east (379—395), and Valentinianus II. in the west. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Mæso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Suevi in Spain, and the Longobards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Longobards, who retained the Arian creed until 662. The Arian controversy has never excited any great interest in modern times, though in England it was revived for a time by the writings of the learned Dr Samuel Clarke (1675—1729), and also by Whiston, who died in 1752. More recently, a part of the Arian doctrine, the denial of 'the eternal sonship,' was broached in the Wesleyan Methodist Society by Dr Adam Clarke and a few followers; but it was soon suppressed by the Conference. Pure Arianism can hardly now be said to exist. It has gradually lapsed into Unitarianism. See UNITARIANS.

ARKA'NSAS, one of the larger states of the American Union, taking its name from the river A. Throughout its entire length, it occupies the right bank of the Mississippi, being separated by that stream, towards the east, from Tennessee and the north half of Mississippi. Its boundaries to the south, west, and north are purely arbitrary and conventional, and are best learned from a map. With a length of 240 miles, and a breadth of 224, the area of A. is 52,198 square miles, being pretty nearly the same as that of England proper. In 1870, out of the equivalent 33,406,720 acres, only 1,859,821 were cultivated, very little more than $\frac{1}{17}$ of the whole, or than $\frac{1}{3}$ of the lands liable to taxation as being allotted and occupied. The principal products of this cultivated land were 740,000 bushels of wheat, 13,382,145 bushels of Indian corn, 529,000 bushels of oats, and 247,968 bales of cotton. A. had in 1820 only 14,273 inhabitants; in 1870, the pop. was 484,471. Though nominally colonised by the French in 1685, yet in 1803 it was still virtually a wilderness, when, as a portion of Louisiana, it came by purchase into the possession of the United States; while it was only in 1819 and 1836 respectively that it became first a territory, and then a state of the Union. The towns of A. are small, the principal being Little Rock, the seat of government, with 12,380 inhabitants, which is about four times as populous as any other place in the state; Camden, Fort Smith, Pine Bluff, Van Buren, and Arkadelphia.

In climate and productions A. occupies, as it were, an intermediate position between the states of the west and those of the south. A. is rich in minerals, particularly in manganese, zinc, and gypsum. It also contains the principal varieties of coal—cannel, anthracite, and bituminous. It likewise possesses lead-ores, which are said to contain a large proportion of silver. The manufactures of the state are comparatively insignificant.

The internal improvements of A. are confined chiefly to plank-roads and levees or embankments against the Mississippi. Of a projected railway of 155 miles from Little Rock to Memphis in Tennessee, only 29 miles appear to have been actually completed. In fact, the state is comparatively independent of works of this description, penetrated as it is by so many navigable rivers—the A., the White River, the St Francis, the Red River, the Washita, &c.

In 1870, the public indebtedness of A., contr mainly in support of banks, amounted to 4,15 dollars, nearly half of it representing 'interes crued and unpaid.' The taxation for the same was 2,866,890 dollars, chiefly the result of a assessment on property of almost every descri —lands, houses, furniture, horses, mules, c stock-in-trade of all trades, gold watches, j lery, &c.

The state legislature meets only once To the Lower House of Congress, A., tion of its population, sends four repr while, like every other state, it has two s the Upper House.

ARKA'NSAS RIVER, next to the M largest affluent of the Mississippi. It is long, rising in the Rocky Mountains on of Utah, and joining the 'Father of Waters' i 33° 54′ N., and long. 91° 10′ W. Flowing g ally through a level country, it presents but obstacles to navigation. The principal difficul connected with its periodical rise and fall- difference between season and seas being less than 25 feet. Notwithstanding how the A. is practicable for steamboats, months of the year, to a distance of from its mouth. It divides the state wh its name into nearly equal parts, varying i within the limits of the same from 3 furlong half a mile. Its banks also, in its lower co contain a good deal of stone-coal.

A'RKLOW, a seaport town in the south- corner of Wicklow county, in lat. 43° 40′ and long. 4° 38′ W., at the mouth of the Avoca, which is crossed here by a br of teen arches. It consists of an upper we and a lower, inhabited by fishermen. are employed in the herring and c Near the town is Shelton Abbey, the Earl of Wicklow. Sand-banks unfit the h ships of any size, and extensive sand-dunes the adjacent coast. In 1798, a bloody en took place here between the royal troops and United Irishmen. Pop. (1871) 5214.

ARK OF THE COVENANT, ARK OF T TESTIMONY, or **ARK OF JEHOVAH**, o the most important parts of the furniture of tabernacle, which, by divine direction, the Isra constructed in the wilderness, and after the temple built by Solomon at Je description of it is to be found in Ex the command given to Moses for its c and also in Exodus xxxvii., from which that it was a chest of shittim-wood (very g supposed to be the wood of a species of acac by some regarded as more probably that wild-olive), overlaid with gold within and two cubits and a half in length, one cubit and in breadth and in height—that is, according to common estimate of the length of the cubit, 3 9 inches in length, and 2 feet 3 inches and height—the lid being formed e gold, with a crown or raised bor about. Within the ark was dep 'mony,' consisting of 'the two tables the stone tablets upon which the ten co were inscribed. The golden lid of the ark was the *mercy-seat* or *propitiatory*, and above it *cherubims* (q. v.), made of the same piece o it, and between them was the place of the or manifestation of the Divine presence. had also golden rings, through which of shittim-wood, overlaid with gold, fo in the journeyings of the which very particular

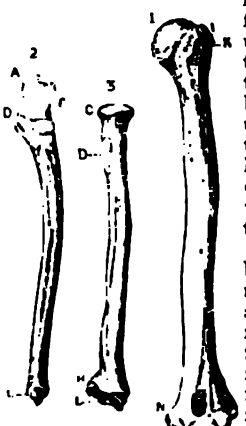
)NA, the north-east promontory of the
Rügen, in the Baltic, almost the most
extremity of Germany. Its steep cliffs
nsist of mixed chalk and loam, with hori-
ins of flint; there is a small deposit of pure
wards the east. Myriads of sand-martins
the clefts of these cliffs. The view from
mmit extends to the coast of Jasmund on
, on the left to the islands of Hiddensöe
n. The name A. is very ancient. In the
s of Saxo Grammaticus we find it written
but its derivation is quite uncertain. On
side is the famous wall or fortified enclo-
which stood the temple of the Wend
antewit. King Waldemar I. of Denmark,
loody conflict, took possession of the fortress
burnt the idol and its temple, and carried
treasures to Denmark. On its site, a light-
feet high, was built in 1827.

WRIGHT, Sir Richard, celebrated for his
s in cotton-spinning, was born at Preston,
shire, Dec. 23, 1732. Of humble origin, the
of thirteen children, and bred to the trade
er, his early opportunities of cultivation were
gly limited. In 1760, he gave up his business
ber in Bolton, and became a dealer in hair.
process for dyeing hair, said to have been
d by himself, increased considerably the
his trade. Very little is known regarding
nts of his mind in the direction of
cation. His residence in the midst of
sing population naturally led him to
est in the processes used in that manu-
t the development of his mechanical
was not, however, due to circumstances, is
ly proved by the fact, that his first effort
was an attempt to discover the perpetual motion. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767, he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton-thread of sufficient tenuity and strength to be used as warp. An invention, indeed, by Mr Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives A. of the honour of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said, was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time A. was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who entered into partnership with him, in conjunction with his partner Mr Need. In 1769 A. set up his first mill, driven by horses, and took out a patent for his invention. In 1771 he set up a larger factory, with water-power, at Cromford, in Derbyshire. The remarkable capabilities of his mind were strikingly evinced in the management of the great business which now demanded his undivided attention. Without personal experience, and with no model to guide him, he introduced a system of management so admirable that it was afterwards universally adopted, and has never been materially improved. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action against Colonel Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, A. published a pamphlet containing a statement of his case. In a new trial, in 1785, he obtained a favourable verdict. The whole question, however, was brought finally before the Court of King's Bench, a few months after, when A.'s claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of A.'s old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out A. as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against the man who abridged labour, but in reality increased its sphere; and on one occasion, a large factory belonging to A. was destroyed in the presence of a powerful military and police force,

without a word of interference from the magistrates. The energy and good sense of A., however, triumphed over all opposition; and at the time of his death, in 1792, the value of his property amounted to about half a million sterling. In 1786 he was appointed high-sheriff of Derbyshire; and on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he received the well-merited honour of knighthood. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated his honourable career at the comparatively early age of sixty.

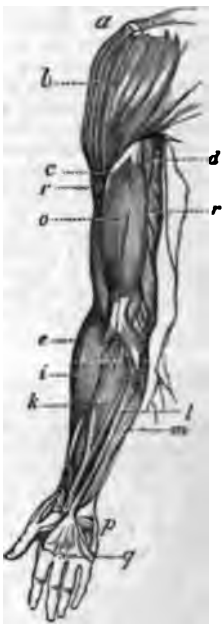
ARLES (anciently, Arelate), one of the oldest towns in France, situated on the left bank of the principal branch of the Rhone, after it has divided into a delta, in the department of Bouches du Rhone. Pop. of the municipality, 23,997; of the town, 15,120. A. carries on a considerable trade. It has manufactures of silk, hats, tobacco, brandy, &c., and forms a market for the productions of the surrounding country. It also possesses a college, a naval school, a public library, and a superb museum of antiquities in natural history. The marshes which rendered the district so unhealthy for a long time, have been considerably drained, and a canal has been formed which connects it with the south coast. Railways also bring it into easy communication with Marseille, Avignon, Nîmes, Montpellier, &c. Under the Romans, it was the seat of a prefect; afterwards, for some time, the residence of the Gothic king, Eurich; and, in 879, was the metropolis of the kingdom of Arelate (see BURGUNDY). In the early Christian times, several important synods were convened here (314, 354, 452, and 475 A. D.). Among the antiquities of A. are a magnificent amphitheatre, which could contain between 20,000 and 30,000 spectators; the ruins of a theatre, also of a palace of Constantine the Great; an obelisk of granite, dug up from the mud of the Rhone in 1389; a burial-place (the Elysian Fields) used by the Romans; and a medieval cathedral, in the old Roman style, with a splendid portal arch.

ARM, the upper extremity of the human body, consists of two portions—the *A.*, strictly so called, and the forearm; the former having one bone, the humerus (1), which moves freely by a globular head upon the scapula, forming the shoulder-joint; and the latter having two bones, the radius (3) and ulna (2), which move on the lower end of the humerus, forming the elbow-joint, and below, with the carpus, forming the wrist.



Bones of the Human Arm.

The humerus is attached by a loose capsular ligament to the scapula, allowing great freedom of motion; and were it not for the muscles passing into I and K, would be frequently dislocated, but it is supported by these muscles on all sides except underneath or opposite the armpit, into which the head of the bone is often driven. The roundness of the shoulder is due to the head of the humerus, so that any displacement is accompanied by a flattening, which at once suggests the nature of the accident. On the shoulder is a large t gular muscle, the deltoid, which lifts the A. the side. At the back is the triceps, which the forearm; in front are two muscles v bend it—the biceps, and the brac on each side below are musc forearm and hand; while on e great muscle of the back (latissimus of the chest (the pectoralis major) are inserte each side of a groove, wherein lies one of the dons of the biceps (q. v.). The motions of the are flexion or bending effected by the biceps, extension or straightening by the brachialis an and the triceps, its projections D and A h received in these movements into corr depressions on the humerus. the hand are principally due to of which rolls at C and H upo L, thereby turning the palm dow or restoring the palm upwards (supination),



Human Arm:

abc, deltoid muscle; *d*, coraco brachialis muscle; *e*, *f*, *g*, *h*, *i*, extensors of wrist and long supinator of the hand; *k*, flexor of fingers and radial and ulnar sides of the wrist; *l*, palm of the hand, or palmaris longus; *p*, palmaris b *q*, palmar fascia; *o*, biceps.

movements being effected by muscles, two movement, which taking their fixed poi humerus and ulna, pull the radius ro latter. The elbow-joint is ginglymoid or hi and therefore has strong lateral l extremely liable to dislocations. by fracture, especially in the y being followed by severe inf is very apt to stiffen, thereby (ossis) deteriorating from the u limb; it is, therefore, unadvisa limb too long in any one position injury. This joint is also very liab but as this is confined to the of small portions of the latter and cut out, and the arm be mobility in a few weeks.

are each called 'an A.' of the service—
it to branch or department.

A'DA, a Spanish word signifying simply an
rce, but applied specially to the great
leet which invaded England in 1588. The
Spain, Philip II., had resolved to strike a
blow at the Protestant interest, by conquer-
which Pope Sixtus V. had made over
ports of Spain, Portugal, and other
dominions belonging to him, had long
d with the noise of his preparations, and the
inent Catholic soldiers from all parts of
flocked to take a share in the expedition.
rquis of Santa-Croce, a sea-officer of great
n and experience, was destined to command
, which consisted of a hundred and thirty
f greater size than any that had been hitherto
Europe. The Duke of Parma was to conduct
forces, 20,000 of whom were on board the
war, and 34,000 more were assembled in the
nds, ready to be transported into England;
n no doubt was entertained of success, the
ostentatiously styled the Invincible A.
could exceed the terror and consternation
ead all ranks of people in England upon the
this terrible A. being under sail to invade
a squadron of not more than thirty ships of
and those very small in comparison, was all
eth had to oppose it by sea; and it was
impossible to make any effectual resist-
and, as the Spanish army was composed of
disciplined and long inured to danger.
the English fleet was much inferior in
of shipping to that of the enemy, it
nageable, while the dexterity and
ners were greatly superior.
gham, a man of great valour
on him, as lord high admiral,
navy; Drake, Hawkins, and
Frobisher, the most renowned seamen in Europe, served under him; while another squadron, consisting of forty vessels, English and Flemish, commanded by Lord Seymour, lay off Dunkirk, in order to intercept the Duke of Parma. Such was the preparation made by the English; while all the Protestant powers of Europe regarded this enterprise as the critical event which was to decide for ever the fate of their religion. In the meantime, while the Spanish A. was preparing to sail, the admiral, Santa-Croce, died, as likewise the vice-admiral, Paliano; and the command of the expedition was given to the Duke of Medina Sidonia, a person utterly inexperienced in sea affairs; these unexpected circumstances served, in some measure, to frustrate the design. Some other accidents also contributed to its failure. Upon leaving the port of Lisbon, the A. next day met with a violent tempest, which sank some of the smallest of the ships, and obliged the rest to put back into the harbour. After some time spent in refitting, the Spaniards again put to sea, where they took a fisherman, who gave them intelligence that the English fleet, hearing of the dispersion of the A. in a storm, had returned to Plymouth, and that most of the mariners were discharged. From this false intelligence, the Spanish admiral, instead of going to the coast of Flanders, to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping laid up in the harbour. But Effingham was very well prepared to receive him, and had just got out of port, when he saw the Spanish A. coming full sail towards him, disposed in the form of a half-moon, and stretching seven miles from the one extremity to the other. The English admiral, seconded by Drake, Hawkins, and Frobisher, attacked the Spaniards at a distance, pouring in their broadsides with admirable dexterity. They did not choose to engage the enemy more closely, because they were greatly inferior in number of ships and guns, as well as in weight of metal; nor could they pretend to board such lofty vessels without manifest disadvantage. In this action, however, two Spanish galleons were disabled and taken. As the A. advanced up the Channel, the English still followed and infested its rear; and as their ships continually increased from different ports, they soon found themselves in a capacity to attack the Spanish fleet more nearly, and accordingly fell upon them while they were taking shelter in the port of Calais. To increase their confusion, Howard selected eight of his smaller vessels, which, after filling them with combustible materials, he sent one after another, as if they had been fire-ships, into the midst of the enemy. The Spaniards, taking them for what they seemed to be, immediately bore off in great disorder; while the English, profiting by their panic, captured or destroyed about twelve ships. The Duke of Medina Sidonia being thus driven to the coast of Zealand, held a council of war, in which it was resolved, that, as their ammunition began to fail, as their fleet had received great damage, and as the Duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, as the winds were contrary to their passage directly back. Accordingly, they proceeded northward, and were followed by the English fleet as far as Flamborough Head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were afterwards cast away on the Western Isles and the coast of Ireland. Of the whole A., fifty-three ships only returned to Spain, and these in a wretched condition. The seamen, as well as the soldiers who remained, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate

valour of the English, and of the tempestuous violence of that ocean by which they were surrounded.

ARMADI'LLO (*Da'sypus*), a genus of mammalia of the order *Edentata* (i. e., toothless)—not, however, truly toothless, but having feeble teeth destitute of true roots, and set apart from each other, and so that those of the one jaw fit into the interstices of those of the other. The number of the teeth is different in different species. The muzzle is elongated, and the tongue smooth and slender, with a glutinous saliva, adapted to the capture of ants and other insects, after the manner of the ant-eaters, but not long and extensile, like theirs. The limbs are short and strong, as are also the claws, and the animals have a great aptitude for digging and burrowing, by means of which they seek to shelter themselves from enemies—burrowing in sand or soft earth with such rapidity that it is almost impossible to dig them out, and indeed it can only be done by persevering till they are exhausted. But that which peculiarly distinguishes the A., and in which this genus differs from all the other mammalia, except the *Chlamyphorus* (q. v.), is the bony armour with which the body is covered, and which consists of polygonal plates not articulated, united on the head to form a solid covering, and similarly to form solid bucklers over the shoulders and the haunches; and between

Armadillo.

these, disposed in transverse bands, which allow of freedom of motion to the body, similar bands in most species protecting also the tail. Armadillos feed not only on insects, but on vegetable and animal food of almost every kind, which by decomposition or otherwise has acquired a sufficient softness. Some of them prefer vegetable food, others delight chiefly in carrion. They are all natives of the warm and temperate parts of South America, in the woods and pampas of which they are found in immense numbers. They are timid and inoffensive, although, when they are incautiously assailed, injury may be received from their claws. Their flesh is esteemed a delicacy, particularly that of the species which feed chiefly on vegetable food. The largest species is fully three feet long, exclusive of the tail; the smallest, not above ten inches. The species are numerous, and the genus has been divided into a number of sub-genera, which some naturalists elevate into genera, naming the family *Loricata* (i. e., mailed). To this family belongs also the genus *Chlamyphorus*, also South American. Fossil remains of gigantic extinct armadillos have been found in the pleistocene strata of South America, forming the genus *Glyptodon* of Owen, so named from the fluted teeth.

ARMADI'LLO is also the scientific name of a genus of *Crustacea* of the order *Isopoda* of Cuvier. This is one of the genera usually included under the popular name of Woodlouse, and one of which (*Porcellio*) is very generally known by that of Slater. The armadillos derive their name from the scaly armour of their body, in which as m found to the mailed quadrupeds of South . They have, in a remarkable degree, the power of rolling themselves into a ball, wl alarmed, so as to expose nothing but plates of the back, and have thence rec the name of Pill Beetles. Like s of the other closely allied *Isopoda*, the were at one time reputed to possess medicinal virtues, now accounted merely imaginary. They were not only used in a dried and pulverised state, but they are said to have been actually swallowed entire as pills. *A. vulgaris* is not uncommon in damp stones, &c., in Britain.

ARMA'GH, a small inland county in U Ireland; bounded N. by Lough Neagh, E. by D S. by Louth, W. by Monaghan and Tyrone greatest length is 32 miles, and breadth 20. 512½ square miles, about four-fifths being ar and a 36th part in woods. The surface is hil the south, and undulating in the centre, attainin Slieve Gullion, in the south-west, the heigh 1893 feet. The other chief heights are Mountains, 1385 feet; the Armagh-bro 1200; and Mullyash, 1034. The country upon Lough Neagh is low and boggy, and plain extends into the south end of A. and cipal rivers, navigable in their lower parts, ar Upper Bann, flowing out of Down north-west miles before it enters Lough Neagh; and the water, which, in its lower part, separates A. Monaghan. The rocks of A. are—Lower the south and middle of the county; Antrim, with the underlying greens Portadown; carboniferous limestone in of the Blackwater, and its tributary t granite in the mountains of the south-ea tertiary strata bordering Lough Neagh. is fertile except in the southern extremit 1872, 172,554 acres were in crop, the principal being oats, potatoes, wheat, and flax. that year was 12,537 horses, 81,227 cattle, sheep, 43,197 pigs. The north and central A. exhibit a dense population, low hills c to the tops, hedgerows, orchards, and thic tered farm-steadings. The county is mostly diocese of Armagh. It returns three mem parliament—two for the county, and one fo city. The chief towns are A., Lurgan, Port and Newry. Pop. (1871) 171,355, of whom are Roman Catholics, 56,154 Episcopalians, 27,776 Presbyterians. The National Schools in numbered 169, with 32,757 pupils.

ir care. The whole of Northern Greece was
ed into sixteen districts (*capitainerica*), each
er the supervision of a chief of these
, however, had himself to receive orders
from a Turkish pasha or Greek bishop. But although the A. frequently suppressed the brigandage of the Klephts, they still regarded them in the light of brothers, inasmuch as they had a common origin and faith; both detested the oppressors of their country; and the sentiment of patriotism overruled every other consideration. This sympathy at last appeared to the Turks so dangerous that they grew alarmed, and desired to substitute for the A. the Mohammedan Albanians, who were the implacable enemies of the Greeks, which resolution did not a little to hasten the insurrection which the Porte ever dreaded. The moment it broke out, the A. pronounced themselves in favour of the national cause, and in the war of independence that ensued, distinguished themselves by their brilliant exploits.

ARMATURE (*armatura*, armour; Ger. *anker*). The term A. is applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. When magnets are allowed to remain any length of time without such appendages, in consequence of the disturbing influence of terrestrial magnetism they lose considerably in strength; but when they are provided with them their magnetism is kept in a state of constant activity, and thereby shielded from this disturbance. The reason of this is found in two facts well known in the science of magnetism—viz., that when a piece of soft iron is brought into contact with the extremity of a magnet, it is itself induced to become magnetic; and that the unlike poles of two different magnets powerfully attract each other. Referring to the figure, the north pole, N, of the horseshoe magnet, NHS, acting on the armature, *sn*, induces it to become a magnet, having its south pole, *s*, next to N, and its north pole, *n*, at the opposite extremity. The pole, S, by virtue of its magnetic affinity, powerfully attracts the north pole, *n*, thus formed, and adds its own inducing influence to heighten the magnetic condition previously induced in the armature by the pole N. The A., from the combined action of both poles of the horseshoe magnet, is thus converted into a powerful magnet, with its poles lying in an opposite direction to that of the primary poles. The original magnet is, in consequence, brought into contact with one of its own making, the exact counterpart of itself—a condition highly favourable to the maintenance of its strength. It is due to the same mutual attractions that a much larger weight can be suspended from the A. thus placed, than what the single poles can together sustain. Bar magnets may be armed in the same way by laying them at some distance parallel to each other, with their unlike poles towards the same parts, and then connecting their extremities by two pieces of soft iron. When a magnet, such as a compass-needle, is free to take up the position required by the magnetism of the earth, the earth itself plays the part of an armature.

ARMED SHIP, in the official language of the Royal Navy, occupies a sort of medium position between a merchant-ship and a man-of-war. It is a private vessel, hired occasionally by the Admiralty for a special purpose, and commissioned for a temporary period. The duty is usually that of guarding some particular coast, or attending on a particular fleet, during a time of war; and while so employed, it is officered and equipped like one of the smaller ships-of-war in the Royal Navy.

ARME'NIA, a high table-land on the southern slope of the Caucasus, stretching down towards Mesopotamia. It has had different boundaries in the various centuries of its history. It is the original seat of one of the oldest civilised peoples in the world, the Armenians, who belong to the Indo-Germanic family of nations. Their oldest records contain nothing certain beyond the facts that, in ancient times, they were governed by independent kings, but afterwards became tributary to the Assyrians and Medes. That dim period which wavers between myth and history begins, in the case of A., about the middle of the 6th c. B.C., when King Dikran, or Tigranes I. of the Haig Dynasty, restored the independence of the kingdom. The last king of this dynasty was slain in battle against Alexander the Great, who conquered the country. After Alexander's death, A. passed through several changes of fortune under the Seleucidæ, who appointed governors over it. Of these, two—Artaxias and Zariadres—made themselves independent of their sovereign, Antiochus the Great, during the time when he was engaged in his contest with the Romans, 223—190 B.C. They divided the province into two districts—Artaxias taking A. Major (that part of the country lying E. of the Euphrates), and Zariadres A. Minor (the part to the W. of that river). The dynasty of Artaxias did not reign long; for about the middle of the 2d c. B.C., we find A. Major in the possession of a branch of the Parthian Arsacidæ, of which the most powerful king was Tigranes the Great, who added to the conquests made by his predecessors in Lower Asia and the region of the Caucasus, Syria, Cappadocia, and A. Minor; defeated the Parthians, and took from them Mesopotamia and other countries. He lost all these territories by his war with the Romans, into which he was led by his father-in-law Mithridates, king of Pontus, in 63 B.C. After this, the assaults of the Romans from the west ever growing more and more vigorous, and those of the Parthians from the east, hastened the downfall of A. Major. The successors of Tigranes became dependent, partly on the one nation and partly on the other, while internally the nobles broke through the restraints of a feeble monarchy, and claimed the privileges of petty kings. Under Trajan, A. Major was for a short time a Roman province. Its subsequent history exhibited an unbroken series of tumults and wars, of violent successions to the throne, despotic reigns, and rapid decay. In 232 A.D. the province was conquered by the Sassanides, who held possession of it 28 years, until Tiridates III., the rightful heir, was restored to the throne by Roman assistance.

It was about this time that Christianity became the religion of A., which was thus the first nation to embrace the new religion. Tiridates himself had been converted by St Gregory the Illuminator as early as about 276 A.D. The old religion of Armenia had for its basis the doctrines of Zoroaster, with a curious intermixture of Greek mythology, and of ideas peculiar to the country. It is certain that the Armenians worshipped as their mightiest gods, Aramazt and Mihir (the Ormuzd and Mithras of the old Persians); but they had also a kind of Venus, whom they styled Anaitis, and several other deities, to whom they offered animal sacrifices. This change of creed, however, made no improvement in the political circumstances of the falling state. The Byzantine Greeks on one side, and the Persians on the other, regarded A. as their prey; and in 428, Bahram V. of Persia made A. a province of the empire of the Sassanides, and with the deposition of Artasir the dynasty of the Arsacidæ was brought to a close. The rule of the Sassanides in A. was marked chiefly by their sanguinary but unsuccessful attempts to extirpate Christianity. In 632, the unhappy country was subjected to another form of despotism under the Arabian califs, and suffered terribly during their contest with the Byzantine emperors. In 885 A.D., Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the califs, and founded the third Armenian dynasty—that of the Bagratids. Under them A. was prosperous till the 11th c., when divisions and internal strife began to weaken the country; till at length the Greeks, having murdered the last monarch of the Bagratids, seized a part of the kingdom, while the Turks and Kurds made themselves masters of the rest—only one or two of the native princes maintaining a nominal independence. In 1242, the whole of A. was conquered by the Mongols, and 147[illegible] Persian province. Afterwards [illegible] fell into the hands of the Turkish

The recent humiliation ... has further weakened the cause of the pro- ...y. In theology the A. C. attributes only *one* nature to Christ, and holds that the Spirit proceeds from the Father alone; the latter doctrine, however, being held by it in common with the 'orthodox Greek Church,' although contrary to the theology of the western churches. With respect to the 'seven sacraments,' it entertains the peculiar notions that at baptism one must be sprinkled three times, and as often dipped; that confirmation is to be conjoined with baptism; that the Lord's Supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek Church in the number of its fasts, but has fewer religious festivals. These, however, are more enthusiastically kept. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is carried on in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is Catholikos, resides at Etchmiadzin, a monastery near Erivan, the capital of Russian Armenia. To this place every Armenian must make a pilgrimage once in his life. The monks of this church follow the rule of St Basil. The Wartabieds form a peculiar class of ecclesiastics; they live like monks, but are devoted exclusively to learning. Secular priests must marry once, but none are at liberty to take a second wife.

ARMENIAN LITERATURE. Previous to the introduction of Christianity by Gregory (300 A.D.), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favourite objects of study, and many Greek authors were translated into Armenian. (See Wenrich *De Auctorum Graecorum versionibus Arabicis, Armeniacis*, &c. Leipzig, 1842.) The Armenian language has an alphabet of its own, consisting of 36 letters, introduced by Mesrob in 406. The most flourishing period of A. L. extends from the 4th to the 14th c. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the East during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors; but in adherence to facts and good taste, they are superior to the general order of oriental historians. In the 14th c., literature began to decline, and few remarkable works were afterwards produced; but since the time of their dispersion, the Armenians have preserved recollections of their national literature; and wherever they are found - in Amsterdam, Lemberg, Leghorn, Venice, Astrakan, Moscow, Constantinople, Smyrna, Ispahan, Madras, or Calcutta - the printing-office is always a feature in their colonies. The most interesting Armenian settlement is that of the Mechitarists (q. v.), on the island of San Lazaro, near Venice.

The Bible translated into Armenian (the Old Testament from the text of the Septuagint) by Mesrob and his scholars (411 A.D.), is esteemed the highest model of classic style. Translations of several Greek authors, made about the same time, have been partly preserved, and contain some writings of which the originals have been lost namely, the Chronicle of Eusebius; the Discourses of Philo; Homilies by St Chrysostom, Severianus, Basil the Great, and Ephraim Syrus. Several old geographical and historical works have been preserved. Among philosophical and theological writers may be

mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Ozniensis. The *Vitæ Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. In poetry and fiction, A. L. is poor. Somal, in his work entitled *Quadro della Storia Litteraria di Armenia* (Venice, 1829), gives a general view of the contents of A. L. The Armenian belongs to the Indo-Germanic group of languages, but has many peculiarities of structure. It is harsh and disagreeable to the ear. The old Armenian, the language of literature, is no longer a living tongue; while the new Armenian, split up into four dialects, contains many Turkish words and grammatical constructions.

ARME'RIA. See THRIFT.

ARMFELT, GUSTAF MAURITZ, a celebrated Swede, whose public life was characterised by striking vicissitudes of fortune, was the eldest son of Baron Armfelt, and born at Juva, in the government of Abo, on the 1st of April 1757. Having, as an officer of the royal guard, displayed great activity and zeal in opposing the machinations of the nobles, who were at that period disaffected towards Gustavus III., the latter appreciated the value of his services, and appointed him to a post in the service of the Crown Prince. During the war between Sweden and Russia (1788—90), in which he was commander of one of the three divisions of the Swedish army, he displayed remarkable courage and spirit, and advanced still higher in the good graces of the monarch. He defeated a Russian force at Summa, near Fredrikshamm; and as military representative of Gustavus, had the honour of concluding a peace at Verela on the 14th of August 1790. On the 16th of March 1792, Gustavus was assassinated. His wound, though mortal, did not instantly deprive him of life, and he employed the brief interval that elapsed before his death in drawing up a codicil to his will, by which the regency was intrusted to the king's brother, Charles, Duke of Sudermania, during the minority of Gustavus IV., A. being named governor of Stockholm, and member of the council appointed to advise with the regent. The Duke of Sudermania, however, could not brook the idea of a check being placed upon his liberty of action, and found means to destroy the codicil, the conditions of which he never intended to observe. A. soon became conscious that his influence was rapidly evaporating. He was rarely permitted to see the young king; and at last, after a secret interview with young Gustavus, departed as ambassador to Naples in July 1792. While in Italy, he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency, and inducing the States to proclaim Gustavus IV. of age. The correspondence was discovered. A. fled to Poland, and afterwards to Russia. He was condemned, during his absence, for high treason, and stripped of his goods and titles, while one of his associates, the beautiful Countess Rudenskold, was subjected to the most brutal punishment, being publicly declared 'infamous,' exposed on a scaffold for some hours, and imprisoned in a house of correction for life. A. expressed his horror of such an atrocity in language sufficiently emphatic, yet, at a later period, he did not scruple to accept office under Charles, on his election to the throne. In 1799, Gustavus IV. received the crown at the age of eighteen, and A. was restored to all his honours. In 1805, he was appointed governor-general of Finland; and in 1808 he commanded the Swedish army raised for the invasion of Norway; but his plans were so completely frustrated, that he was compelled to witness the invasion of Sweden by the successful Norwegians, and was in consequence recalled and dismissed by the king. In the following year a revolution took place, Gustavus was deposed, the Duke of Sudermania elected in his place, and A. was appointed president of the Military Council. But shortly after, being implicated in the poisoning of the Prince of Augustenburg, he was obliged to fly to Russia, where he lived during the remainder of his life in high honour. The title of Count was conferred on him, he was made chancellor of the university of Abo, president of the Board of Finnish Affairs, and member of the Russian senate. He died at Tzarskoe Selo on the 19th August 1814.

ARMIDA, one of the most prominent female characters in Tasso's *Jerusalem Delivered*. As the poet tells us, when the Crusaders arrived at the holy city, Satan held a council to devise some means of disturbing the plans of the Christian warriors, and A., a very beautiful sorceress, was employed to seduce Rinaldo and other Crusaders. Rinaldo was conducted by A. to a remote island, where, in her splendid palace, surrounded by delightful gardens and pleasure-grounds, he utterly forgot his vows, and the great object to which he had devoted his life. To liberate him from his voluptuous bondage, two messengers from the Christian army—Carlo and Ubaldo—came to the island, bringing a talisman so powerful that the witchery of A. was destroyed. Rinaldo escaped, but was followed by the sorceress, who, in battle, incited seve[illegible] to attack the hero, and at last herself [illegible] the fight. She was defeated by Rinaldo, [illegible] confessed his love to her, persuaded her to [illegible] a Christian, and vowed to be her faithful ka[illegible] The story of A. has been made the subject o[illegible] opera both by Gluck and Rossini.

ARMIES, armed forces under regular military organisation, employed for purposes of national offence or defence. An army may comprise the whole military men employed by the state, or only a portion under a particular commander. When an armed force is under no constituted authority, and imperfect in its organisation and discipline, it cannot be said to be worthy of the name of an army, and may be little better than a horde of banditti. Of this nature are the *fillibustering* expeditions (see FILLIBUSTERS) in which certain portions of the citizens of the United States frequently engage. Through long ages of experience, the principles of military organisation, and the laws to which A. are specially amenable, have gradually reached a high degree of perfection. The primitive wars among barbarous people are always stealthy, depending on the forest and the wilderness for their tactics, and considered successful if an enemy can be attacked unawares, despoiled, and carried into slavery. After a time, war advances to the position of an art, and is conducted by men who have received a certain training. An army becomes an instrument not only for vanquishing enemies, but for seizing countries. Even then the highest position of an army is not reached; for the defence of a country requires more military skill, perhaps, and a better organisation of troops, than an attack.

In the several historical articles in this *Encyclopædia* relating to the chief nations of ancient and modern times, the wars in which these nations engaged are succinctly noticed as elements in the life of each nation; but it seems desirable, in the present place, as a means of rendering intelligible certain minor details scattered through the work, to give a brief description of the chief points in which the A. of different states or countries have differed in constitution.

ANCIENT—*Egyptians.*—The most ex- ueror among the Egyptians, Seson- , lived sixteen centuries before the and although the evidence for his is very questionable, there is reason the organisation of his A. can be ccurately traced. His father, Amenophis, foundation for the military glory of Sesostris. latter was born, Amenophis caused all the n who were born on the same day as his apart as a special body, to be reared for ; they were taught everything that en their bodies, increase their courage, ir skill as combatants and leaders; consider themselves bound as the ents or companions of the young time Sesostris became king of Egypt; he formed a sort of militia, distributed as colonists, each soldier having a portion of maintain himself and his family. When had been drilled to military efficiency, nded them as an army for military con- Asia, and placed the chosen band above as officers over the different sections of

the great days of the Persian er of the army consisted of cavalry, uished for their bravery and impe- ess. The infantry were little better mob. The war-chariots, too, though strike terror when dashing into hostile are available only on level ground. As to bers of men composing the great Persian statements are too wild to be trustworthy. ow all exaggeration, however, it is cer- Persian A. were very large. When opposed to Alexander the Great, his army ared at various numbers—from 7,50,000 to 0 men. The king was in the centre, sur- by his courtiers and body-guard; the Per- Susians were on the left; the Syrians and on the right. The foot-soldiers, forming of the army, and armed with pikes, axes, were formed in deep squares or masses; s were in the intervals between the on the right and left flanks; and the and elephants in front.

nians.—The Greeks introduced many changes in A, both in the organisation manœuvres. Every man, in the earlier country at least, was more or less a ured to a hard life, taught to bear arms, ected to fight when called upon. The lead- ach state paid attention to organisation a way never before seen. It was not a but a sort of national militia, that n, Platæa, and Mycale. So far as arrangement of A., the Lacedæ- invented the *phalanx* (q. v.), a particular grouping foot-soldiers. This phalanx con- eight ranks, one behind another; the front r ranks being composed of picked men, intermediate ranks of less tried soldiers. er of men in each rank depended on the resources of the commander. These men ally armed with spears, short swords, and

ians.—The Athenians made a greater number ctions than the Lacedæmonians in the differ- s of troops forming their A. They had fantry, constituting the men for the phalanx, ed with spears, daggers, corslets, and shields; antry, employed in skirmishes and in cover- phalanx, and armed with light javelins and a sort of irregular infantry, who, with bows and arrows, and slings, harassed the enemy in march, and performed other services analogous in some degree to those of sharpshooters in a modern army. It is recorded that Miltiades, the Athenian hero at Marathon, invented the 'double-quick march,' to increase the momentum of a phalanx when rushing on the enemy.

Macedonians.—Philip of Macedon, the father of Alexander the Great, having the sagacity to see that he could not vanquish his neighbours so long as he adopted the same formation and tactics as themselves, set about inventing something new. He resolved to have a standing army instead of a militia; to have at command a set of men whose trade was fighting, instead of citizens who were traders and soldiers by turn. As a further change, he made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, four rows of men could present the points of their long pikes protruding in front of the front-rank, forming a bristling array of steel terrible to encounter. Besides these heavy infantry, there were light troops marshalled into smaller bodies for more active manœuvres. Philip organised three kinds of cavalry - heavy, armed with pikes, and defended by cuirasses of iron-mail; light, armed with lances; and irregular.

Thebans.—This nation introduced the army-formation of *columns*, much deeper than broad, or having more men in file than in rank. A new kind of tactics was introduced in accordance with this formation; the movement being intended to pierce the enemy's line at some one point, and throw them into confusion.

Romans.—These able warriors initiated changes in army matters, which had a wide-spread influence on the nations of the civilised world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred; but all were available up to the middle-time of life. They went through a very severe drilling and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the Senate decreed the formation of *legions*, or army corps, deputing this duty to the consul or prætor. Magistrates sent up the names of eligible men, and tribunes selected a certain number from this list. See LEGION. The Roman legion, in its best days, had many excellent military qualities—great facility of movement; a power of preserving order of battle unimpaired; a quick rallying-power when forced to give way; a readiness to adapt itself to varying circumstances on the field of battle; a formidable impetuosity in attack; and a power of fighting the enemy even while retreating. The heavy infantry were armed with javelins, heavy darts, pikes, and swords; the lighter troops with bows and arrows, slings, and light javelins; while the defensive armour comprised shields, cuirasses, helmets, and greaves.

Those ancient nations which had no distinctive features in their A., need not be noticed here.

ARMIES, MEDIEVAL. The downfall of the Roman Empire marked the dividing-point between ancient and medieval times in military matters, as well as in other things that concern the existence of nations. The barbarians and semi-barbarians who attacked on all sides the once mighty but now degenerate Empire, gradually gained possession of the vast regions which had composed it. The mode in which these conquests were made gave rise to the *Feudal System* (q. v.). What all had aided to acquire by conquest, all demanded to share in proportions more or less equal. Hence arose a division of the

conquered territory; lands were held from the chief by feudal tenure, almost in independent sovereignty. When European kingdoms were gradually formed out of the wrecks of the Empire, the military arrangements put on a peculiar form. The king could not maintain a standing army, for his barons or feudal chieftains were jealous of allowing him too much power. He could only strengthen himself by obtaining their aid on certain terms, or by allowing them to weaken themselves in intestine broils, to which they had always much proneness. Each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy, there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valour than by any well-concerted plan.

One great exception to this military feudality was furnished by the *Crusades* (q. v.). So far as concerns A., however, in their organisation and discipline, these expeditions effected but little. The military forces which went to the Holy Land were little better than armed mobs, upheld by fanaticism, but not at all by science or discipline. Numbers and individual bravery were left to do the work, combination and forethought being disregarded.

A much greater motive-power for change, during the middle ages, was the invention of gunpowder. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valour, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after the period usually denominated the middle ages. The art of making good cannon and hand-guns grew up gradually, like other arts; and A. long continued to depend principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers.

During the greater part of the 14th and 15th centuries, the chief A. were those maintained by the Spaniards and the Moors on one European battle-ground, by the English and the French on another, and by the several Italian republics on a third. In those A., the cavalry were regarded as the chief arm. The knights and their horses alike were frequently covered with plate or chain armour; and the offensive weapons were lances, swords, daggers, and battle-axes. A kind of light cavalry was sometimes formed of archers on smaller horses. As to army-formation, there was still little that could deserve the name; there was no particular order of battle; each knight sought how he could best distinguish himself by personal valour; and to each was usually attached an esquire, abetting him as a second during the contest. Sometimes it even happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made, until towards the close of the 15th c., to embody a system of tactics and manœuvres for cavalry; and even that attempt was of the most primitive kind. Nor was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with the use of firearms; but, midway as it were between two systems, they observed neither completely; and the A. in which they served presented very little definite organisation.

ARMIES, MODERN. The formation of *standing* A. may be said to have introduced the modern military system. When the remarkable exploit of Jeanne d'Arc (Joan of Arc) had enabled Charles VII. to check the victorious progress of the English in France, he set about remodelling his army. By gradual changes, and amid great difficulty, he converted his ill-governed forces into a disciplined standing army. During the reign of his son, Charles VIII. (1483—1498), the consequences of this change made their appearance. Charles conducted a well-appointed army into Italy (1494), in support of some pretensions which he had to the throne of Naples.

The change made by Charles VII. was not simply that of substituting a compact standing army for an ill-organised medley of feudal troops and of mercenaries; feudalism itself gave way under the influence of this combined with other reforming agencies. So far as concerned the actual formation and discipline of the standing A. above noticed, a few changes were from time to time introduced: pistols and carbines were given to the cavalry; cuirasses were worn by the heavy troopers; and new evolutions were introduced. During the Thirty Years' (1618—1648), Gustavus Adolphus and [illegible] adopted opposite modes of dealing with a infantry: the former spread them out [illegible] width, and only six ranks in depth; the latter adopted a narrower front, with twenty to thirty ranks. Frederick the [illegible] the next century, introduced a most co system of tactics and drilling; insomuch [illegible] he could manœuvre, he nearly always won battles; but when the result depended on bold unexpected onslaughts, he was more frequently a loser than a winner. The great military leader in the early part of the present century, Napoleon Bonaparte, made a larger use than any previous European general of the method of mov of troops with great celerity, beating the detail before they could combine in one spot.

It is desirable to present, in the most con form, a few statistics of the actual A. of leaving to future articles, under the names several countries, cities, and battle-fields, all concerning special A. and military enc

France.—A law passed in 1872 enact every Frenchman, with a few specified liable to personal service in the army, and substitution. Every Frenchman not de for military service, or specially ex from, must be for five years in (composed of those who have reached 20 years), for four years in the reserve active army, for five years in the territorial and for six years in the reserve of the army. By the law of July 24, 1873, is divided, for military purposes, into 18 each occupied by a corps d'armée, cont divisions of infantry, 1 brigade of cavalry, artillery, 1 battalion of engineers, 1 squadron of the military train. When the present reorgani completed, the *active* army will be compose regiments of infantry (line, light, Zouaves, A tirailleurs, &c.), 25 single battalions, and panies (depots, &c.); making in all, for the 279,986 men; of cavalry, 67 regiments in 3 in Algiers, 13 depots of these regiments cavalry school, comprising 67,888 men; 40 regiments and 17 companies, wit men; engineers, 4 regiments, having 13 of the military train, 11,486 men; in active army, 441,007. On the war number would be increased to 1,104,735. taking account of sanitary corps, gen Including the *territorial* army, its reserve the reserves of the active army, the t force of France is 2,505,000. The budget provided for 454,200 men, including gend &c.

...—According to a law of military re... the Russian forces are to be raised by ...ion, to which all are liable who ...their twenty-first year, and are ...incapacitated. Substitution is pro... period of service is fifteen years; six in active service, and nine in the reserve. The Russian military forces are composed of regular and irregular troops. The regular troops comprise 164 regiments of infantry, 281,012 men; cavalry, 52 regiments, 42,444 men; artillery, 33,021 men; engineers, 9819 men; train, 4617 men. Total of field-troops in time of peace, 370,913. In war as follows: infantry, 568,253 men; cavalry, 47,379; artillery, 40,846; engineers, 13,306; train, 21,329—total, 691,113. With local and other troops (in fortresses, &c.), and reserve troops, the Russian army in Europe amounts, on the peace-footing, to 19,103 officers, and 508,674 men; in war, 22,871 officers, and 879,755 men. The army of the Caucasus amounts in peace to 125,643; in war, to 167,841. The army of Turkestan to 22,906; of Siberia, from 25,000 to 27,000. Besides some thousand troops as gendarmes and in various military establishments, there is a grand total for the regular Russian army of 23,693 officers and 676,454 men; on the war-footing, 28,148 officers and 1,091,679 men. In addition there are the irregular troops, comprising about 190,000 men, chiefly cavalry.

Denmark.—All able-bodied young men 21 years of age are liable to serve eight years in the regular army of Denmark, and eight years in the reserve. Denmark has 31 battalions of infantry (guards, line, reserve), comprising 26,750 men; 5 regiments of cavalry, with 2122 men; 2 regiments and 2 battalions of artillery, with 6523 men; 2 battalions of engineers with 580 men. The total, line and reserve, is 1031 officers, 35,975 men; on the war-footing, 52,656 men.

Sweden and Norway.—There are five classes of soldiers in Sweden; the enlisted troops, the national militia (indelta), the conscription troops (bevaering or landvaern), the militia of Gothland, and the volunteers. Of the soldiers of the line there is a total of 35,646 men; of the reserve (landvaern), 86,101; of the Gothland militia and volunteers, 150,830. Norway has an army of its own, divided into the troops of the line, with reserve, military train, the landvaern, the civic guards, and the landstorm. The troops of the line are 12,000 in time of peace; in time of war not more than 18,000 without the assent of the Storthing.

Holland.—The army of the Netherlands is formed partly by conscription and partly by enlistment; and there is besides a militia. The European army has, of infantry, 1122 officers and 43,690 men; cavalry, 184 officers and 4318 men; engineers, 1035 men; artillery, 421 officers and 10,610 men. With the staff, &c., the total force is 62,068 officers and men. There is besides in the East Indies a force of 27,659 officers and men.

Belgium.—The standing army is formed by conscription. Substitution is permitted. The legal period of service is eight years. Belgium has 74,000 infantry (16 regiments), 8848 cavalry (7 regiments and 2 squadrons), 14,513 artillery (6 regiments), 2486 engineers. In all, and without officers, 99,847.

Italy.—The Sardinian law of conscription forms the basis of the Italian military system. The infantry of the line under arms on the peace-footing number 86,017; the bersaglieri, 16,818; depots, 11,560; the cavalry, 18,449; the artillery, 19,732; engineers, 3027; carbineers, 20,915; administrative troops, &c., 7047; giving a total of 183,205. On the war-footing, these several forces are so increased as to give a total of 541,575; and with the addition of the provincial militia, 743,656.

Spain.—The army of Spain was reorganised in 1868 after the model of that of France. The active

army has 60,000 infantry, 9000 cavalry, 2500 engineers, and 8500 artillery, making a total of 80,000 men. The reserves increase this number to 216,000. There is besides an army of 54,500 in Cuba, 9400 in Porto Rico, and of 9000 in the Philippines.

Switzerland.—The federal army has 1269 engineers, 8401 artillery, 1942 cavalry, 6078 tirailleurs, 65,991 infantry, and 364 of a sanitary corps. In all, 84,045. There are besides, of the reserves, 51,102; the landwehr, 65,562; giving a total available military force of 201,578.

Turkey.—In 1871, the Turkish regular army had infantry to the number of 72,000; cavalry, 9000; artillery, 9500; engineers, 1600; with 1200 miscellaneous troops amounting to 93,300. It is meanwhile proposed that by 1878 the regular army should be increased to 152,000. The irregular troops (Bashi-bazouks, Spahis, &c.) are about 70,000. And the contingents which the dependent states are bound to furnish are severally: Upper Albania, 10,000; Bosnia, 30,000; Egypt, 15,000; Tunis and Tripoli, 4000.

United States.—At the commencement of 1861 the United States army consisted only of about 14,000 regular troops. In various successive levies by the president during the civil war (1861—1865), as many as 2,653,062 men had been called out—nearly one-fourth of the entire population of the Northern States. After the war, the standing army was steadily diminished; and by a law passed in 1870, it is provided that there shall be no more than 30,000 enlisted men at one time. That force is distributed amongst 25 regiments of infantry, 10 of cavalry, 5 of artillery, and 1 battalion of engineers. Besides the regular army there is the militia, of which the nominal strength was at the last census, 3,245,000.

A separate and fuller treatment of the army of Great Britain is reserved for BRITISH ARMY; and for that in our Indian possessions see EAST INDIA ARMY. All the various matters relating to the formation, organisation, discipline, arms, equipments, duties, and tactics of A., will be found succinctly treated under appropriate headings.

ARMI'LLARY SPHERE (*armilla*, a ring), an instrument intended to give a just conception of the constitution of the heavens, and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers made many of their observations, and we find even Tycho Brahé making most of his planetary observations with the help of such an instrument. The A. S. is, however, now only used as an aid to instruction in astronomy, and in this respect is generally supplanted by the celestial globe. The object aimed at in the A. S. will be better understood by reference to the celestial globe represented in the diagram. Supposing the observer on the earth to be in the centre of the sphere, the earth on which he stands shuts out from his view the lower half of the heavens, or the part lying below the horizon HH. The hemisphere above him may be regarded as divided into two equal portions, an eastern and a western, by the meridian MM, which passes through the pole P, and the zenith Z, of which the eastern half is shewn in the figure. The north pole is supposed to be elevated above the horizon, and its elevation is measured by the arc NP, or the height above the north point; and the heavens appear to rotate round an axis PQ, of which P is one extremity; the south pole, Q, [illegible] being below the horizon. The [illegible] the horizon HH, are the only [illegible] tain a fixed position with regard to [illegible] observer.

Of the other leading celestial circles, the equator or equinoctial LL, extending from the east to the west point of the horizon, the tropics of Cancer and Capricorn, respectively BB and CC, and [illegible] circle AA, although rotating with the [illegible] the same position with regard to the [illegible] the ecliptic, KK, is constantly changing [illegible] and position towards it. Circles which [illegible] pole to pole, cutting the equator at right [illegible] called circles of declination. The circle which through the vernal equinox ♈ (see ARIES), is [illegible] nated the equinoctial colure; and that passing the summer solstice O (see SOLSTICE), the [illegible] colure. The circles just named, together with Antarctic Circle, are represented by corresponding rings in the A. S. If S be a star, the following names given to the arcs which determine [illegible] with regard to these circles: ♈V, Right [illegible] SV, Declination; SP, Polar distance; [illegible] distance; XS, Altitude; (XN + 180°), [illegible] reckoned from the south pole westward.

ARMI'NIUS, JACOBUS, the found[illegible] anism, was born at Oudewater (Old [illegible] His real name in Dutch was James [illegible] in accordance with the prevailing custom scholars in those days, he Latinised it. His was a cutler, and died when A. was a child. a preliminary education at Utrecht, he [illegible] (in 1575) a course of study at newly [illegible] university of Leyden, where he [illegible] years, and where he seems to have [illegible] reputation, for the Amsterdam merchants to bear the expense of his further [illegible] ministry, on condition that he would [illegible] out of their city unless permitted to do [illegible] 1582, he went to Geneva, and received [illegible] tions of Theodore Beza, the most rigid [illegible] Here he made himself odious by the boldness which he defended the logic of Peter Ramus in opposition to that of the Aristotelians of the day, and in consequence had to retire to Basle, where his fame must have preceded him, for he was [illegible] by the faculty of Divinity in [illegible]

... the death of A., his followers gained ..., and boldly asserted their views, but still remained in a minority. In 1610, they presented to the assembled states of the province of Holland a 'Remonstrance'—from which they were styled 'Remonstrants'—which contained the following propositions: 1. That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. 2. That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. 3. That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. 4. That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. 5. That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong 'Counter-remonstrance,' asserting plainly absolute predestination and reprobation. After several fruitless discussions, the states of Holland, in January 1614, acting under the advice of Oldenbarneveld, a senator, and the learned Hugo Grotius, issued an edict of full toleration for both parties, prohibiting at the same time the continuance of the controversy. The Counter-remonstrants (or Calvinists) refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waard-gelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death—among them the aged senator Oldenbarneveld, May 13, 1619—while Grotius and others were imprisoned. In these circumstances, the Synod of Dort was held (1618—1619), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (January 14, 1619), the thirteen Arminian pastors, with the learned and eloquent Simon Episcopius at their head, were excluded. The doctrines of the Counter-remonstrants were embodied in ninety-three canons; the Belgic Confession and the Heidelberg Catechism were confirmed as authorities for the reformed churches of the Netherlands; and three hundred Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter in France, Holstein, England, &c. Afterwards, under Frederick-Henry, the stadtholder after Prince Maurice (1630), they were again tolerated in Holland, and in 1634 Episcopius opened his theological college in Amsterdam.

Since that time, the Remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions and independence in church government. The rejection of all creeds and confessions; the free interpretation of the Scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness, and the view of the sacraments as merely edifying forms or ceremonies: all these and other points of belief display the same tendency

which is found in their church polity. Their annual conference on ecclesiastical affairs is composed of ministers and lay-deputies, and takes place in June, alternately at Amsterdam and Rotterdam. The number of Remonstrants is now only about 5000, and is still decreasing. In 1809, they had 34 congregations with 40 preachers in Holland; but in 1829, only 20 congregations with 21 preachers. The largest society of A. is in Rotterdam, and numbers only 600 members.

Although the Arminians are thus dwindling away as a distinct body, their tenets respecting predestination have been adopted with greater or less modification by several other Christian denominations (see METHODISTS, BAPTISTS); as well as by multitudes of the individual members of those churches whose formularies are Calvinistic (see CALVINISM). They are also very prevalent in the Church of Rome.

A'RMISTICE, a suspension of hostilities between two armies, or two nations at war, by mutual agreement. It sometimes takes place when both are exhausted, and at other times when an endeavour to form a treaty of peace is being made. A particular example will best illustrate the nature of an A. On the 25th of February 1856, the representatives of England, France, Austria, Prussia, Sardinia, Turkey, and Russia, met in congress at Paris, to consider the terms of a treaty of peace which should terminate the war at that time going on between five of the above-named powers. The British nation was very unwilling to suspend hostilities during the sitting of the congress—partly on account of the numerous failures of diplomacy in the preceding year, and partly because Russia was suspected of only wishing to gain time. It was agreed, however, at the first sitting, in conformity with the laws of nations and the usages of war, that an A. should be declared, to be announced by telegraphic message to the commanders in the Crimea, and to last until the 31st of March. During that period of about one calendar month, the hostile armies were to remain strictly at peace, but the fleets of the allies were to continue their blockade of Russian ports. The information reached the generals late on the 28th of February. On the morning of the 29th, a white flag was hoisted in the Russian camp outside Sebastopol; several Russian officers assembled around it; and a glittering cavalcade of British, French, and Sardinian officers proceeded thither. The accredited officers compared notes, found the terms of the A. clear, agreed on a boundary-line between the hitherto hostile forces, and formally gave pledges for a cessation of fighting. The courtesy of civilised nations at once succeeded to the horrors of war; the Russian commander gave a magnificent entertainment to the allied commanders, and was entertained in turn; the soldiers 'fraternised,' by little gifts of tobacco, and ludicrous attempts at conversation, across a small stream which formed part of the boundary-line; and a few British officers were permitted to make excursions into the interior of the Crimea. The A. ended on March 31, not by a renewal of hostilities, but by the signing of a treaty of peace.

ARMORICA, the country of the Armorici, i.e., 'the dwellers on the sea' (Celt. *ar*, on or near; and *mor*, sea), the name by which the people occupying the coast of Gaul between the Seine and the Loire were known to Cæsar. At a later period, the name A. was confined to the country afterwards styled Britannia Minor, or Bretagne (q. v.).

A'RMORY may mean a storehouse for arms; but the name is also often applied to a collection of ancient armour and weapons such as those in the Tower of London, in Sir Samuel Meyrick's mansion at Goodrich Court on the Wye, and Castle.

A'RMOUR is a general name for for personal defence, as contradisti arms or weapons of offence. Little o soldiers at the present day, seeing hand conflicts, in which it is especia are rather exceptional in modern before the invention of gunpowder called in England by the name of especially used.

All the ancient nations who occu history were accustomed to adopt o the defensive clothing or implements ively come under the denomination o A. was sometimes worn; but brass, i metals were preferred. Some of the leaders had much silver and gold in th Bible, shields, helmets, breastplates, are mentioned among the articles o worn by the Israelites and their op classical writers—Homer, Xenopho Livy, Tacitus, Varro, &c.—supply dence of the use of A. among the nati whom they wrote.

It is believed that the early Britons no other A. than shields. The Angl more fully provided. At different ti Norman Conquest they appear to cornered helmets; loricæ made of A.; leathern helmets; wooden shield leather; sheep-skin shields; conical c of metal; pectorals or neck-guards; of undressed hide; flat-ringed A. tunics of overlapping pieces of le fitting cuirasses of leather, and someti linen; leg-guards of twisted woollen of various sizes, from half a yard t a half in length; and casques having resemblance to the ancient helmets Danes were in Britain, they had at A. than leathern neck-pieces, which d way over the shoulders and chest: shin-pieces for the legs. In the Knute, however, they adopted a Sir Samuel Meyrick supposes them from the Norsemen or Norwegians. tunic, with a hood and long sleeve which covered feet as well as legs; shaped helmets or skull-caps, with a which hid nearly the whole face ex All these were probably made of leath of the surfaces were strengthened masoles, a perforated net-work of steel

of offence, may be divided into two great classes—those that act by means of gunpowder, and those that do not. Of arms that act otherwise than by explosion, the greater part have been in use from the earliest times; they include the bow and arrow, sling, pike, spear, lance, dart, javelin, dagger, axe, mace, spiked or knotted club, scythe for chariots, dirk, bayonet, sword, cutlass, &c., together with such artillery as the ballista, catapulta, and battering-ram. Weapons depending on the use of gunpowder are of two kinds—those that can be held in the hand, and those that are too heavy to be portable. In the first class, we find the names of the hand-cannon, hand-gun, arquebus, haquebut, demi-haque, matchlock, wheel-lock, firelock, currier, snaphaunce, caliver, escloppette, petronel, dragon, hand-mortar, dag, tricker-lock, carbine, fusil, fowlingpiece, blunderbuss, pistol, musket or musquet, musketoon, rifle, &c. In the second class, more usually included under the name of artillery, we find the springel, war-wolf, bombard, cart-of-war, culverin, demi-culverin, serpentine, falcon, saker, cannon, howitzer, petard, carronade, mortar, rifled cannon, war-rockets, &c. The more important of these are briefly noticed under the proper headings. It is needless, perhaps, to add that nine-tenths of these are utterly obsolete.

The Surveyor-general of the Ordnance in the British army has the duty of providing and keeping efficient the arms in use by the regular and auxiliary forces, and of maintaining an ample reserve in the Royal Arsenals. Each regiment makes a report on these subjects yearly. If the commanding officer of a regiment ascertains that a new supply of arms is needed for the men under him, or a supply of anything in relation to the arms, he indents upon the Controller of the District for the supply required; which is forthwith made by that officer, subject, however, to a pecuniary fine upon the regiment, if the arms have not lasted a fair time.

ARMS, ARMO'RIAL BEARINGS, or ENSIGNS, are the names given to such devices as when painted on a shield form a coat. These terms in popular speech include all the accompaniments of a shield—viz., the crest, helmet, and where such exist, the supporters, &c. See these terms. See also HERALDRY.

ARMS, ASSUMPTIVE. See HERALDRY.

ARMS, BELLS OF, are tents, mostly of a conical shape, for containing the small-arms for each company in a regiment of infantry. The tent is frequently painted with the colour of the facings of the regimental uniforms.

ARMS, MESSENGER AT. See MESSENGERS-AT-ARMS.

ARMS, SERJEANT AT. See SERJEANT-AT-ARMS.

ARMS, STAND OF. A stand of A. is the complete set necessary for the equipment of one soldier, whether horse or foot.

ARMSTRONG, JOHN, physician and poet, was born about 1709 at Castletown, a pastoral parish in Roxburghshire, of which his father was minister. He studied medicine at the university of Edinburgh, where he took the degree of M.D., February 4, 1732. Soon after, he commenced practice in London, and became known by the publication of several fugitive pieces and medical essays. In 1737 he published a very objectionable poem, *The Economy of Love*, which injured his reputation for a time. His principal work, *The Art of Preserving Health*, a didactic poem in blank verse, extending through four books, appeared in 1744. In 1746 he was appointed physician to the hospital for sick and lame soldiers. In 1751 he published a volume on *Benevolence*; in
al epistle on *Taste*; and in 1758, a
essays of no great merit. In 1760

he was appointed physician to the forces in Germany. In 1761 appeared from his pen *Day, a Poem*. On the peace in 1763, he returned to London, and resumed practice. In 1771 he made a continental tour with Fuseli, the painter, an account of which he published, with the title of *A Short Ramble through some Parts of France and Italy, by Lancelot Temple, Esq.* His last work was a volume of medical essays. He contributed to Thomson's *Castle of Indolence* the four stanzas at the end of the first part, descriptive of the diseases resulting from sloth. Died 7th September 1779. A. was the friend of Thomson, Mallet, Aaron Hill, Dr Young, Wilkes, and the principal wits and literary men of the period. He seems to have been a reserved, indolent, and splenetic man, 'who quite detested talk;' kind-hearted withal, and of frugal habits, having left £3000, saved out of a small and precarious income. His fame rests entirely on *The Art of Preserving Health*, his other works being now only known by name.

A'RMSTRONG, JOHN, an eminent physician and medical writer, was born 8th May 1784, at Ayres Quay, near Bishop-Wearmouth, where his father was the superintendent of some glassworks. He studied medicine at the university of Edinburgh, and in June 1808 took the degree of M.D. He commenced practice at Bishop-Wearmouth, and in 1811 was chosen physician to the infirmary at Sunderland. In 1816 he published a work on *Typhus*, which greatly extended his reputation. His researches concerning the causes and phenomena of febrile diseases having made his name well known in the metropolis, he was induced, in February 1818, to remove to London, where his practice became extensive, and he was elected physician to the Fever Hospital. In 1821, in concert with Mr Edward Grainger, he established a medical school in Webb Street, Borough, where he lectured on the practice of physic. He also delivered a course of lectures on Materia Medica. In 1826 he joined Dr Boot and Mr E. Bennett in establishing a new school of medicine in Dean Street, Soho, but shortly after relinquished his connection with it. He died of consumption, 12th December 1829, aged 45. Exclusively devoted to the duties of his profession, Dr A. was very successful in the elucidation of medical science. His works are numerous, and he contributed various papers to the medical journals. His lectures, inserted in the *Lancet* in 1825, were published in a separate form after his death, with the following title, *Lectures on the Morbid Anatomy, Nature, and Treatment of Acute and Chronic Diseases, by the late John Armstrong, M.D. Edited by Joseph Rix*—one of his pupils. (London, 1834, 8vo.)

A'RMSTRONG, SIR WILLIAM GEORGE, noted for various mechanical inventions, especially in artillery and in water-power machinery, was born in 1810 at Newcastle, where his father was an eminent corn-merchant, and in 1851 filled the office of mayor. A. was educated at the school of Bishop-Auckland; but his peculiar mental powers were chiefly cultivated by the opportunities which his father's tastes gave him at home, of acquainting himself with chemistry, electricity, and mechanics. Though the natural bent of his mind was to some profession in which these sciences would have been available, he readily yielded to his father's wishes, and was articled to Mr Armourer Donkin, an eminent solicitor in Newcastle, who, at the expiration of his time, adopted him as a partner. A high sense of duty enabled A. to give his excellent general powers of mind to business; but he devoted much of his leisure to his favourite pursuits, and his inventive faculty was constantly active. About 1838, observing one day a little stream descending along a height near Newcastle, and driving but a single mill to how much more purpose it might hydraulically, and thus was led into experimenting, which resulted in his much improved hydraulic engine, of whi tion was given in the *Mechanics' M* April 18, 1840. Following up this inve view to practical applications, he gave t in 1845, a hydraulic crane, which has pr eminent utility in raising weights at har warehouses. The discovery of electricity a workman at a fixed engine on the Railway in 1840, had meanwhile led A. path, and in 1842 he brought to perfecti ratus for producing electricity from st was soon after introduced into the Pol stitution in London. The evolution of th depending in reality on the friction s the small quantity of water which acco steam in its discharge, the great merit o tion in this case lay in the form he gav through which the steam passed. Th inventions brought him into prominent was elected a member of the Royal Soci and, shortly afterwards, in conjunction friends, commenced the Elswick E the suburbs of his native town. This is upon a large scale, at first chiefly producing hydraulic cranes, engines, ac and bridges, for use in Great Britain, th and India, but now embracing also wo production of ordnance.

In 1854, while war was raging in the War Office was solicited by many invent trial of new forms of cannon and proj Armstrong, one of the number, attracte tion of the authorities, and was employ explosive apparatus for blowing up the at Sebastopol. This led him soon consider improvements in ordnance, an a form of breech-loading cannon, comb peculiarities in structure and action. encouragement to make a few field-pi new method. He made lengthened exp the strength of iron and steel, on the rel of cast and wrought iron, on the best grooves in rifling, on the best pitch these grooves, on the most convenien loading at the breech of the gun, on the for lessening the recoil, on the best form ture of shot and shells, and on the fuses for igniting the shells during their flight

Most of the early experiments were guns throwing 6-lb. and 18-lb. shot and subsequently 32-lb. shells. The last-nam built up piecemeal, to avoid flaws or fa insure strength, lightness, and durabili made in 3-feet lengths. Bars of wr inches wide, were heated to whiten spirally round a steel bar or core, an other bars were twisted over these in a but with an opposite turn of the spiral; perhaps a fourth were added, according t ness and strength needed. Another whiteness preceded a thorough weldin layers of bars by a steam-hammer. The of these 3-feet pieces were then nicely t adjusted, placed in contact, and bound the enormous pressure of a wrought-iron on while at a white heat. By varying and length of these sections, a gun o could be made. The core was then re the bore of the gun rifled by exquisite The rifle-grooves were so small and upwards of 40 in number; their such as to make a complete cir

breech of the gun was wholly distinct, cted in a different way; it could be ward by unscrewing, and had a hole for introducing the shot or shell At first, the inventor adopted a his gun; but afterwards relied on wrought-iron. The projectile em- this gun might be solid shot, shell, canister-shot; but the shell was that to interest is attached. It was about three n length; and thus a 32-lb. shot or shell ired from a gun of much smaller calibre ere spherical. The shell was built up of parate pieces of cast-iron, very accurately enveloped in an iron sheath. Outside of bands of lead, soft enough to be forced d grooves of the gun, and thus to acquire nt by which the straightness of red. resu.. obtained by a gun such as is ed are almost incredible. An ordinary der weighs 57 cwt.; Armstrong's 32- ighs 26 cwt. The former requires 10 lb. as a charge; for the latter 5 lb. will he former will send a shot or shell 3000 range of the latter exceeds 9000 yards. attached to the shells are so exquisitely the shell can be made to burst either aving the gun, or half-way on its path, strikes an object; in the last-named case, k of shavings will afford the necessary and yet, so close is the structure, that hell has been fired completely through oak without the pieces separating. experiments were made chiefly with a inch calibre, and so light that two v it (without its carriage); this small h 1500 yards with wonderful accu- had a range of 3000 at a certain eleva-

had spent much of his time and thoughts r years on this subject, the government, the strongly expressed opinions of rs of all ranks, proposed to secure the ce experiments for the nation. A. the government, without any stipulation, ll his past inventions, but also all such as hereafter discover. This led to arrange- ich the ministers in parliament character- eral and patriotic on his part; and the suggested were accepted. An office was r him, that of Chief-engineer of Rifled for seven years provisionally; and a cer- of salary was determined on, in con- nce of his past inventions and of his ices. He was knighted by the queen in

ar connection, partaking in some degree of a partnership, between the govern- Elswick firm, underwent changes from and was brought to a close in 1863. nuance, guns of gradually increasin de on A.'s system; 3, 5, and 12 18, 20, 32, and 40 pounders; then ing in calibre, until at length a 600- produced, weighing upwards of 20 tons. ystem of construction, the adoption of a ber of rifle grooves, and the use of the formed segment shell, were continued; de variations in the combination of steel and adopted muzzle-loading for many of Elaborate experiments made by led to a conclusion that the A. many disadvantages for large nding its range, accuracy, ce, easiness to clean, and safety to the gunners while loading, it is neither so cheap nor so simple as the muzzle loader; it is difficult to handle, complicated, apt to get out of order, and not so useful for general purposes. The comparative cheapness has had much to do with the recent preference of the War Office for the Woolwich gun, a muzzle-loader. A. supplies, and has long supplied many foreign governments with his guns, chiefly of large calibre. The manufacture is of the highest order, effected through the medium of machine tools of exquisite construction; but the practical utility of the gun, as compared with the Whitworth, Palliser, and other kinds, is still matter of controversy.

The great reputation and commercial success of A. depend on his skill as a constructor of water-power machinery. Early in his career, in 1847, when a plan was adopted for supplying Newcastle with water, he suggested that the power derived from the descent of the water through pipes from the reservoir, should be utilised for working hydraulic cranes on the quay, and for various mechanical purposes in the town; this was done with marked success. The system has rapidly grown; until, at length, the A. hydraulic machinery is largely adopted in England and abroad for raising, lowering, hauling, and other purposes in connection with railways, canals, docks, piers, harbours, lock-gates, manufactories, warehouses, &c. The fabrication of the machinery employs a very large number of hands at Elswick, where the works are carried on by a joint-stock company. A., who belongs to several scientific societies, was instrumental in bringing about the appointment of the Coal Commission in 1866, by which so much valuable evidence has been collected and published. He has also taken an active part in the inquiries concerning the operation of the Patent Laws, he being very hostile to them in their present forms. The degree of LL.D. has been conferred on A. by the university of Cambridge.

ARMY. Referring to ARMIES (ANCIENT, MEDIEVAL, and MODERN) and to BRITISH ARMY for brief historical notices of national military forces, and leaving to other portions of this work all details concerning the formation and tactics of such forces, it may be well to mention here certain distinctions in the application of the name A. A *Covering A.* is encamped or in cantonments, for the protection of the different passes or roads which lead to the town or other place to be protected. A *Siege A.* is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *Blockading A.*, either independent of or auxiliary to a siege A., is intended to prevent all ingress and egress at the streets or gates of a besieged place. An *A. of Observation* takes up an advanced position, and by celerity of movement keeps a close watch on all the manœuvres of the enemy. An *A. of Reconnaissance* has a more special duty at a particular time and place, to ascertain the strength and position of the enemy's forces. A *Flying A.* comprises a strong body of horse and foot, moving quickly from place to place, to alarm the enemy, and to protect garrisons. Any one of these may be forced into an engagement in the field; but they are all more or less subsidiary to the *Main A.*, by which the greater operations in the field are usually conducted.

ARMY ADMINISTRATION. The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of the British army, are included in the term A. A. They are distinct matters from military command and discipline. The Sovereign has the supreme command of the British army; but the Secretary of State for War is her responsible representative in all that concerns

administration—the Commander-in-chief being her representative in matters relating to military command and discipline. The Secretary is the organ through whom the wishes of the Sovereign are reconciled with the wishes and intentions of parliament. Until the war with Russia in 1854, the administrative departments were much scattered; their defective organisation led in great part to the miseries suffered by the British troops in the Crimea; but now they are all consolidated under the Secretary of State for War. See WAR DEPARTMENT.

ARMY AGENT. See AGENT, ARMY.

ARMY ESTIMATES. In the spring of every year, the British government having formed a plan concerning the extent and appliances of the military force for that year, the War Office sends to the Treasury a series of accounts setting forth the probable cost of everything required. These accounts are called the A. E. If they are approved by the Treasury, the Chancellor of the Exchequer adverts to these, along with other estimates, in his annual 'financial statement,' made to the House of Commons in his capacity as guardian of the public purse. In preparing the A. E. the Secretary of State for War applies to the heads of all the departments under him for detailed accounts of their probable requirements. Another functionary then incorporates and adjusts these into a whole; they are submitted to the Treasury; and, if approved, are presented to the House as the A. E. Should the Commons grant the money, the Accountant-general of the War Office makes the requisite drafts or demands from time to time; and the Treasury authorises the Paymaster-general of the Forces to honour these drafts. The money itself is in the Bank of England; this establishment receives a certain annual sum from the government for managing such financial matters.

The A. E. are drawn up in conformity with a model which differs little from year to year. There are certain great headings, each comprising many minor divisions: viz., 1. *Regular Forces* (4 votes); 2. *Auxiliary and Reserve Forces* (4 votes); 3. *Ordnance Establishments and Manufactures, and Purchase of Stores* (4 votes); 4. *Works and Buildings* (barracks, fortifications, &c.); 5. *Educational Establishments* (schools, libraries, &c.); 6. *Administration of the Army*; 7. *Non-effective Services* (half-pay, retiring allowances, pensions, &c.). The various items are more or less sifted by the House of Commons; and any one or more of them can be refused altogether, or granted in diminished amount. The A. E. for 1874–1875, which may be cited here as an illustrative example, refer to the period from April 1, 1874 to March 31, 1875. The total number of British troops provided for in these estimates is 191,834; but as 62,840 are charged to the East Indian treasury, as being required for India service, the House of Commons was asked only to provide for the remaining 128,994. The horses are 26,453, of which 11,325 are for India service. Without going into any details, we will simply give the amounts under the six great headings:

1. Regular Forces—pay and allowances,	£1,752,1[illegible]
2. Auxiliary and Reserve Forces,	1,3[illegible],9[illegible]
3. Ordnance Services (provisions, clothing, arms, stores,	5,042,0[illegible]
4. Works and buildings,	7[illegible],3[illegible]
5. Education,	135,[illegible]
6. Administration,	[illegible],3[illegible]
7. Non-effective Services,	2,1[illegible],5[illegible]
	£14,4[illegible],5[illegible]

ARMY LIST is the name of a publication issued monthly by authority of the War Office. It contains the names of all commissioned officers in the British army. Then come the general and fie the dying-out Indian Army. Next the officers who hold military honours or s ments. The bulk of the work, however with an enumeration of all the reg Queen's army, and all the officers in arranged according to the numerical regiments. To this are added lists of the Rifle Brigade, Colonial Corps, Roy Royal Engineers, Royal Marines, Contr Medical Department; and of officers re pay and on half-pay. Next follow th the Militia, Yeomanry, and Volunteer the Militia and Volunteer officers of colonies. A full index, an obituary, changes gazetted during the past montl new regulations, complete the work. A of similar but non-official character, *Hu* a more condensed arrangement of type, information contained in the official lis in addition.

ARMY SCHOOLS. The colleges and schools relating to military mat country may be grouped into three cl intended to increase the military effic officers and men; those for imparti knowledge to persons not yet in milit and those which bear relation to t school-tuition of soldiers of the rank children. The principal of those in the are the Staff College, the Royal Militar Sandhurst, the School of Military En Chatham, the Department of Artiller Woolwich, the School of Gunnery at S School of Musketry at Hythe, and the lery Institution at Woolwich. The sec represented by the Royal Military Woolwich; while in the third are the tary Asylum (better known as the Dul School) at Chelsea, the Royal Hibernia Dublin, the Regimental Schools, and Schools. Chelsea Hospital is an asy ans, not a school of instruction. See ACADEMY, MILITARY SCHOOLS, SANDHU

ARMY WORKS CORPS. When generals engaged in the Crimean war, months of 1854, knew that the siege need to winter outside Sebastopol, gra were presented to their notice. The the landing-place at Balaklava to the siege-camp was not less than eight mi only road was a mud-track, almost i wet weather. How to get the heavy g and shell, the provisions, and the general the front, was a question not easy of so British soldiers were too few even for military duties, and yet they were cal services of an extra and arduous n these facts became known in England was made that an 'Army Works C formed, to consist of strong and excavators, Cornish miners, and wea these should have with them all the to ances for making roads and digging we they should be accompanied by trav shops and skilled artisans, to effect that require more skill than physical labour diate necessities of Lord Raglan, in reg ing up supplies, were met by the cons railway from Balaklava to the hei Sebastopol, by special contract with and Brassey; but the large amoun labour continually needed for various to the formation of the A. ARNAULD, Antoine, the greatest advocate of his time in France, was born at Paris in 1560. He was descended from an ancient family of Auvergne, which had distinguished itself both in civil and military affairs. A. was not less remarkable for his eloquence than for his probity. His zealous defence of the university of Paris against the Jesuits in 1594 won for him a wide celebrity. It was reprinted in 1717. He published another work against the Society of Jesus, and several tractates of an earnest political character. The Jesuits accused him of being a Huguenot, but the accusation was unfounded, for he had no personal predilection in favour of Protestantism as a distinct religious system. He had several children, who formed the nucleus of the Jansenists and Port-Royalists. He died 29th December 1619.

ARNAULD, Antoine, known as 'the great A.,' the twentieth and youngest son of the preceding, was born at Paris, February 6, 1612. Although originally intended for the bar, he could not conceal his dislike of the legal profession, and was in consequence dedicated by his mother to the service of the church. Entering the Sorbonne, he became a pupil of Lescot, the confessor of Cardinal Richelieu, and afterwards Bishop of Chartres. Lescot initiated him into the scholastic theology; but his attention having been drawn to the writings of Augustine, he soon conceived an admiration for that profoundest of the early Christian thinkers which he ever after retained. It was Augustine, he himself admitted, who first shewed him the great difference between the two states—that of a nature whole and sound, and that of a nature corrupted by sin. In 1641, the Sorbonne wished to receive him into their society, on account of his extraordinary piety and talents, but Cardinal Richelieu opposed this. In the following year he was ordained a priest, and in 1643 he published a work entitled *De la Fréquente Communion*, which was received in the most favourable manner by all except the Jesuits, who had taken alarm at the virtues of A., and were already attempting to defame one whom they instinctively felt to be a reproach to their order. As a consequence of this publication, he was now admitted 'of the Society' of the Sorbonne. A. not only replied to the aspersions of the Jesuits in his *Avertissement*, but also sent forth a work which was the prelude to a long and fierce contest with his adversaries, *Théologie Morale des Jésuites* (Moral Theology of the Jesuits). But the hatred of the latter was not confined to literary libels; they advised the chancellor of the Sorbonne to carry the dispute to Rome, whither A. would be obliged to follow and defend himself. In this scheme, however, they were defeated.

A. now buried himself in seclusion for twenty-one years, during which period, however, his pen was almost continuously active. In 1644 appeared his *Tradition de l'Eglise sur la Pénitence* (Opinion of the Church on the Doctrine of Penitence). It was a reply to the attacks which the Jesuits had made against his *Frequent Communion*. A. was still entangled in the disputes which arose out of this treatise, when he became involved in another controversy that coloured the whole of his subsequent career, and may be said to have won for him his position in history. This was the great Jansenist controversy. In 1640 had appeared a posthumous work of Jansenius, Bishop of Ypres, entitled *Augustinus; seu Doctrina Sancti Augustini de Humanæ Naturæ Sanitate, Ægritudine, Medicinâ, adversus Pelagianos et Massilienses*. It laid down with a rigour equal to that of Calvin the doctrines of predestination, the corruption of human nature, and the depravity of the will. It was specially intended as a counteractive against the lax principles and

morality of the Jesuits, many of whom, and especially their great champion, Molina, entertained extreme Pelagian views of the freedom of the human will, which they had cunningly interwoven into their 'scarlet-coloured' web of ethics. The work, in the meantime, was condemned by Pope Urban VIII., on the 1st of August 1641. A., who quickly apprehended its vital importance in the existing state of things, boldly ventured to defend it against the censures of the papal bull. He published several pamphlets, closing with a first and second *Apologie de Jansénius*. It is to the honour of the religion of A., however, that it was not always controversial. Whenever a moment of armistice was permitted him, he occupied it in writing such works as *Mœurs de l'Eglise Catholique*, *La Correction*, *La Grâce*, *La Vérité de la Religion*, *De la Foi*, *de l'Espérance*, *et de la Charité*, and the *Manuel de Saint Augustine*. He also varied these occupations by translating into Latin his *Frequent Communion*, and by the composition of his *Novæ Objectiones contra Renat. Descartis Meditationes*, and several smaller tractates. In addition to his literary labours, he undertook the direction of the nuns of Port-Royal des Champs, a convent of which his sister, Marie Jaqueline Angélique Arnauld, was abbess. In this retreat he was surrounded by many friends, thirsting like himself for the quiet pleasures of study, some of whom have left their mark in the world, such as Pascal, Nicole, &c. Here they wrote in common numerous excellent works. A. executed parts of the *Grammaire Générale Raisonnée*, *Eléments de Géométrie*, and *L'Art de Penser*. In 1649 the Jansenist controversy broke out more fiercely than ever. The *Augustinus* of the Bishop of Ypres was again attacked and condemned by the Sorbonne and the pope. A. replied in his *Considérations*. In 1650 appeared what he conceived to be his best work, *L'Apologie pour les Saints Pères*. For the next half-dozen years he was engaged in constant and painful disputes; yet, in spite of the polemical character of his life, the impression of his piety and earnestness was deepened in the mind of the nation; and on reading some of his compositions, even Alexander VII. is reported to have praised the author, and to have exhorted him for the future to despise the libels of his adversaries. During the strife he published *La Concorde des Evangiles* and *L'Office du Saint-Sacrement*. In 1655–56, for prudential reasons, he left his retreat at Port-Royal; about the same time he was expelled from the Sorbonne and the faculty of theology.

In 1656, the war with the Jesuits was renewed—not, however, by A. in person. An unknown knight with closed visor had ridden into the lists—the great Pascal. Under the *nom de plume* of Louis de Montalto, he discharged his scorpion wit against the Jesuits for about a year and a half in the *Provincial Letters*. A. furnished him with materials; but, in 1658, he took the field *in propriâ personâ*, by publishing his *Cinq Ecrits en faveur des Curés de Paris contre les Casuistes relâchés*. In 1662 appeared *La Nouvelle Hérésie* (of the Jesuits); in 1669 the first volume of his *Morale Pratique* (of the Jesuits), the last of which was not published until the year of his death.

A., who was a sincere Catholic after his fashion, next had a theological controversy, properly so called, with the reformed minister Claude, the consequence of which was his volume, *Du Renversement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification* (1672). In 1675 he returned to the subject in his *Impiété de la Morale des Calvinistes*. Some years previous to this, A. had enjoyed the peace of Clement IX., which put a stop for the time to the Jansenist controversy. He had been presented to the papal nuncio and to the *Grand Monarque*, both of whom flattered him highly; but the Jesuits, who could not breathe freely in sence, used their utmost efforts to prejudic against him, and at last the king issued an o his arrest. A. hid himself for some time, but withdrew into Belgium. He felt his exile though honoured by many learned and inf persons, and could not rest in one city, bu dered from place to place, ever displaying t astonishing vigour of mind and the same pe tendency. It is strange that this man, wh celebrated amongst his friends for ex gentleness of heart, should have been so controversies, even with his friends, for he against his enemies only, but against Pascal, Nicole, his protector, Pope Innocent XI., and friend, Père Malebranche. So earnest was the truth—which earnestness had no doub greatly intensified by persecution and contro that he could never thoroughly realise the ide there might be truth on the other side als died at Brussels, 8th August 1694. His which amount to upwards of 100 volumes published at Paris, 1775-1783.

ARNAULD, ROBERT D'ANDILLY, the e of Antoine Arnauld, the advocate, and b the great Arnauld, was born at Paris in 1 was a person of considerable consequence French court, where his influence was ever e beneficially. Balzac spoke very highly of hi the age of fifty-five, he quitted the bustle world for the solitude of Port-Royal des C where he devoted himself to religious histo biography. His chief works are translation as those of the *Confessions of St Augustine*, the *History of the Jews*, by Josephus. The work is esteemed more elegant than accurat ever. In 1668, appeared his translation *Lives of the Holy Fathers of the Desert several Saints;* and in 1670, that of of St Theresa. He was likewise the a pieces of religious verse. He died 27 1674.

ARND, a German Protestant clergy Ballenstadt, in the duchy of Anhalt, in Lutheran pastor at Quedlinburg, Br elsewhere, and died at Celle, in Han As a man he was remarkable for his piety benevolence; but he is chiefly known for entitled *True Christianity* (Wahres Chr which was translated into most European and is yet popular in Germany. Its objec cation'—the promotion of practical religion is written with great warmth and unction strain of piety bordering on mysticism. It called the Protestant à Kempis, and its Fenelon of the Protestant Church. English translation by W. Jaques (Lond 2 vols.).

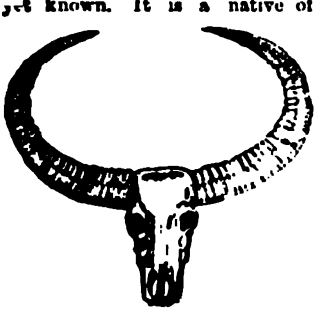
ARNA, the largest animal of the … yet known. It is a native of India,



Skull and Horns of Arnee.

and is found chiefly in the forests at the base of the Himalayas and in the north-eastern provinces, never descending to the low plains. It is usually regarded by naturalists as a wild variety of the buffalo; but Mr Vasey thinks 'our information on the subject not yet sufficiently precise

Arnee.
(From an Indian picture.)

to determine this point.' It is named *Bos Arnee*, as a distinct species, by some authors. A pair of horns in the British Museum measure more than six feet each along the outer curve. When the head of an A. is placed with the muzzle on the ground, it requires the outstretched arms of a man to hold the points of the horns. From the manner in which the A. is introduced in Indian paintings, it would seem to have been sometimes tamed.

A'RNHEIM, or ARNHEM, the Roman Arenacum, capital of the province of Guelderland, in Holland, with a population of 18,000, is situated on the right bank of the Rhine, which is here crossed by a bridge of boats; it has a considerable transit-trade between Amsterdam and Germany. The environs of this strongly fortified town are exceedingly picturesque. Its most remarkable buildings are the ancient residence of the Dukes of Guelderland, and the Reformed Dutch Church, which contains their monuments. There are several paper-mills in the neighbourhood. In 1813, A. was taken by storm by the Prussians, under General Bulow, and the way thus prepared for the occupation of Holland.

A'RNHEM LAND, that part of North Australia which lies between Anson Bay on the west and the Gulf of Carpentaria on the east, stretching in E. long. from about 129° to about 137°; in lat. it extends indefinitely southwards from about 12° S. It takes its name from the ship of the Dutch navigators who discovered it in 1618.

A'RNICA, a genus of plants belonging to the natural order *Compositæ*, sub-order *Corymbiferæ*. The flowers of the ray are female and ligulate, those of the disk hermaphrodite and tubular. The receptacle is naked; the pappus hairy. The root, leaves, and flowers of the Mountain A. (*A. montana*), sometimes called Mountain Tobacco, are much valued in medicine, and administered in various forms as a stimulant in paralytic affections, typhoid fevers, and other diseases. They are also applied with much benefit to bruises, to promote the reabsorption of extravasated blood. They contain a peculiar volatile oil, a resin, an extractive matter, and an alkaloid (*Arnicina*). The root is perennial and crooked, the stem about two feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often

two inches in breadth. It flowers from June to August, forms an ornament of mountain meadows

Arnica montana.

in Germany and Switzerland, and is found upon the continent as far south as Portugal, and as far north as Lapland, but is not a native of Britain.

ARNIM, ELIZABETH VON, better known as Bettina, wife of Ludwig Achim von Arnim (q. v.), was born in 1785 at Frankfort-on-the-Maine. From her childhood excitable and eccentric, an early and profound impression was made upon her mind by the suicide of her friend, the Canoness von Gunderode. The next great event of her life was her devoted attachment to, and intimacy with Goethe, at that time a man of nearly sixty. Their correspondence, entitled *Goethe's Letters to a Child*, was published in 1835, and translated by Bettina into English. Her letters are poetical, graceful, and fascinating, though often careless and extravagant, and abound in graphic sketches of men of the time. Goethe turned many of these letters into verse. Bettina's later works were semi-political in their character, and like her earlier, full of fantastic beauty. She lived to a good old age, dying in 1859.

ARNIM, KARL OTTO L[illegible] VON, a well-known writer of travels and other works, was born at Berlin 1779. After studying at Halle and Gottingen, he travelled at different times over the most of Europe, and was employed on the embassies at Stockholm and London. His *Flüchtige Bemerkungen* [illegible] *Reisen* (Passing Remarks by a Passing Traveller, 6 vols, Berl. 1807–1809), is recommended for its clear elegant style as contrasted with the inflated and involved writing of the 'Academic' school. A. also wrote in English *Napoleon's Conduct towards France*, Lond. 1814, and published *Germania Nunquid Moriture*, with German and English text, Lond. 1816. He was the author of a play and several poems. He died in 1831.

ARNIM, LUDWIG ACHIM VON, a fantastic but original German writer of romances, was born in Berlin, January 26, 1781. After devoting years to the study of the physical sciences, he his career as an imaginative author with *Revelations*, a romance which, though bas the principles of the new poetic school whic then risen in Germany, indicated, nevertheles the author could strike out a way of his own travels through Germany afforded him an tunity of catching the peculiarities of popular its various provincial manifestations. He was ally interested in the old popular poetry, and up among his countrymen a warmer sym by the publication, along with Clemens *The Boy's Wonderhorn* (Heidelberg, In 1809 appeared the *Winter Garden*, a coun novels; in 1810, the romance, entitled *The Riches, Guilt, and Repentance of the Countess L* in 1811, *Halle and Jerusalem, the Sports Student, and the Adventures of a Pilgrim*, in last his humour took a very saucy turn. In he published the *Crown Guardians*, a work ch terised by its originality, richness of fancy, vivid portraitures. The later years of his life spent partly in Berlin and partly at his estate Dahme, where he died, Jan. 21, 1831.

A'RNO, next to the Tiber the most consi river of Central Italy, rises on Mount Falter offset of the Apennines, at an elevation of 44 above the level of the sea, and 25 miles n Arezzo. It flows through the deep and fertile of Casentino, in a south-east direction; enter richly cultivated plain of Arezzo, where it re the water of the Chiana; then flows in a north and north course through the upper valley o A. (*Valdarno*), one of the most delicious Tuscany; afterwards it receives the Sieve, tributary, and turns its course towa flowing past Florence, Empoli, and town of Pisa. The whole length of about 140 miles. In old times the embo the A. was at Pisa; now it is about f miles distant, in lat. 43° 41′ N., and long. It is navigable for barges as far up as Flore in the summer season even this frequently be impossible. The Italian poets speak of A.;' but, in truth, its water have unpleasant colour of milk and co d The A. is noted for the rapid character of its inundations. The are those of September 1537, w the Valdarno was laid under wate the height of 8 feet in some parts of of 1740, the latter being caused by tinuance of the sirocco, which completely snows on the Apennines.

A'RNOLD, or **ARNALD**, of native of that town, and was the success with which he contended corruptions of the clergy in the the 12th c. He was educated in Abelard, and adopted the mendicant preaching, the people of his native place inveighed against their bishop and the and insurrectionary spirit spread over a part of the country, when he was cited before the Lateran Council, and banished from He returned to France, but experienced the enmity of St Bernard, who denounced him as an enemy to the church. He thereupon took up Zurich, where he settled for several years, while his doctrines exerted a power Rome, which ended in a general the city government, whereupon A. [illegible] endeavoured to lead and direct exhorted the people to

ancient Roman republic, with its consuls, , and equestrian order. But they, provoked herv and opposition of the papal party, d ng themselves, gave way to the . The city, indeed, continued for te of agitation and disorder. Lucius the populace in an insurrection in E III., to escape a similar fate, fled so violent struggles were subdued n IV., who, feeling the weakness of ority, turned to the spiritual, and extreme measure of laying the city unication, when A., whose party be- ged, and fell to pieces, took refuge with influential friends in Campania. On the of the emperor, Frederick I., for his corona- 1155, A. was arrested, brought to Rome, nged, his body burned, and the ashes into the Tiber.

OLD, JOHANN, a miller of Newmark, who the time of Frederick II. of Prussia, and to a remarkable legal process. He com- to the king that his landlord, by making had taken away water from the mill; that had therefore refused to pay rent for the mill, he held a lease; but had been condemned the unanimous decision of two legal The king took up the case, and regarding it pression of the poor, reversed the decisions m. dismissed his high-chancellor, impri- other officers of justice, and gave stitution should be made to the miller. he king died, and under Frederick was more coolly investigated, re that the condemned chancellor al persons were exonerated from all r, and the miller was recompensed ns of time and money.

OLD, MATTHEW, a living English poet, the of the late Dr Arnold of Rugby, was born ember 1822, and educated at Winchester by. In 1840 he was elected scholar of ollege, Oxford; in 1844 he obtained the prize; and in 1845 he was elected a Oriel College. In 1851 he was appointed r Majesty's Inspectors of British Schools. he was elected Professor of Poetry at and in 1859—1860 was sent to the con- y the English government as assistant to the ioners appointed to inquire into the state tion France, Germany, and Holland. In isited the continent to get informa- o the methods of secondary education re.

first known as a poet of classic taste nurity of imagination, but of late years clusively betaken himself to prose. tions in verse are *Poems* (1853), con- r fine pieces, *Sohrab and Rustum*, a scull, *Balder*, and *Merope* (1858), to naturalise in English literature the Greek drama; and *New Poems* (1867). e writings are growing numerous. The his lectures on *Translating Homer* (1861); rt on *Education in France, Germany, and* (1861); *A French Eton or Middle-class and the State* (1864); *Essays on Criticism Lectures on the Study of Celtic Literature Schools and Universities of the Continent* nd *Culture and Anarchy, an Essay in Poli- Criticism* (1869). Recently he has ublic by his piercing and audacious liter criticism to religion, and no his *St Paul and Protestantism* more his *Literature and Dogma* (1872), are meant to work a serious revolution in the national faith.

ARNOLD, THOMAS, D.D., head-master of Rugby School, and the author of a *History of Rome*, was born June 13, 1795, at West Cowes, in the Isle of Wight. In 1803 he was sent to Warminster School, in Wiltshire, but was removed in 1807 to the public school of Winchester, where he remained till 1811, when he was elected a scholar of Corpus Christi College, Oxford. In 1815 he was elected fellow of Oriel College, and he gained the chancellor's prize for the two university essays, Latin and English, for the years 1815 and 1817. As a boy, we are told he was shy and retired; as a youth, disputatious, and somewhat bold and unsettled in his opinions; but before he left Oriel, he had won the good opinion of a college which at that time boasted of such names as Copleston, Davison, Whately, Keble, Hawkins, and Hampden. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he occupied himself in preparing pupils for the university. In 1820 he married Mary, youngest daughter of the Rev. John Penrose, rector of Fledborough, in Nottinghamshire, and sister of one of his earliest school and college friends, Trevenen Penrose. About ten years were spent in this quiet and comparatively obscure life; he was preparing himself for the arduous post he afterwards occupied; he was maturing his opinions, and he had also already commenced his great literary undertaking, the *History of Rome*. It was a period which he himself was accustomed to look back upon with some feeling of regret. His letters at this epoch reveal to us a fine ambitious spirit bending cheerfully to the task of tuition, more useful than glorious; they also prove to us that those views of a religious and political character which afterwards distinguished him, were being matured in the privacy of Laleham. 'I have long had in my mind,' he thus writes to a Mr Blackstone, 'a work on Christian politics, or the application of the Gospel to the state of man as a citizen, in which the whole question of a religious establishment, and the education proper for Christian members of a Christian commonwealth, would naturally find a place. It would embrace also an historical sketch of the pretended conversion of the kingdoms of the world to the kingdom of Christ in the 4th and 5th centuries, which I look upon as one of the greatest *tours d'adresse* that Satan ever played. . . . . I mean that by inducing kings and nations to conform nominally to Christianity, and thus to get into their hands the direction of Christian society, he has in a great measure succeeded in keeping out the peculiar principles of that society from any extended sphere of operation, and insuring the ascendency of his own.' He here expresses, in a somewhat sportive and familiar manner, the great principle which he afterwards contended for with so much earnestness, that there should be a Christian laity, a Christian legislature, a Christian government; by which he did not mean a system of laws or government formed in the manner of the Puritans, out of texts of Scripture, rashly applied, but imbued with the *spirit* of the New Testament and of the teaching of Christ.

It was at Laleham also that A. first became acquainted with Niebuhr's *History of Rome*. This was an era in his life. It produced a revolution in his historical views, and his own *History of Rome* became modelled almost too faithfully on that of the great German.

From Laleham he was called to undertake the arduous duties of the head-mastership of Rugby School. On these he entered August 1828. Our space does not permit us to dwell upon the details of that system of public education which he perhaps

carried to its perfection. We can only take notice of the high tone, moral and religious, which he preserved amongst the boys. He had the tact to make himself both loved and feared. He guided with great dexterity the *public opinion of the school*. 'In the higher forms,' says his biographer, 'any attempt at further proof of an assertion was immediately checked. "If you say so, that is quite enough; of course I believe your word;" and there grew up in consequence a general feeling that it was a shame to tell A. a lie—he always believes one.' On one occasion, when he had been compelled to send away several boys, he said: 'It is *not* necessary that this should be a school of 300, or 100, or of 50 boys, but it *is* necessary that it should be a school of Christian gentlemen.'

But the school was very far from occupying the whole energies of A. The *History of Rome* went on; he took part in all the great questions of the day, political and theological. In politics he was a Whig, without being fettered—as we need hardly say—by the ties of party. In the theological discussions of the day, he was chiefly distinguished by the broad views he had adopted of the nature of a Christian church. As already intimated, it was his leading idea that a *Christian people* and a *Christian church* ought to be synonymous expressions. He would never tolerate that use of the word church which limited it to the clergy, or which implied in the clergy any peculiar sacredness, or any traces of mediatorial function. The *priest* was unknown to him in the Christian community; this placed him at once in antagonism to the High Church party; and even clergymen of the Low Church complained that he did not set sufficient value on their sacred order. But all men, of whatever party, admitted and admired the zeal with which he taught that the full spirit of Christianity should permeate the whole of our civil or political life. If he seemed to lower the altitude of the clergy, it was only because he would raise the general level of the laity. He was convinced that 'the founders of our present constitution in church and state did truly consider them to be identical, the Christian nation of England to be the church of England; the head of that nation to be, for that very reason, the head of the church.' It may be doubted whether this is quite historically correct; but it certainly presents a noble theory to the imagination.

In domestic life, Dr A. was most happy; here he was distinguished by unfailing cheerfulness and amiability. In 1832, he purchased Fox How, a small estate between Rydal and Ambleside, and it was in this charming retreat that he enjoyed in the vacations, amongst the family circle, his own uninterrupted studies. Fox How has become a classical spot to every tourist.

For a brief time he held a place in the senate of the London University; he resigned the seat on finding that he could not introduce some measures which he had at heart. In the year 1842, he received from Lord Melbourne the offer of the Regius Professorship of Modern History at Oxford. This appointment he accepted with peculiar gratification. He delivered some introductory lectures, which were heard with enthusiastic interest; and it was his intention, on his retirement from Rugby, to enter with zeal upon the duties of his professorship. But this and all other literary enterprises were cut short by a sudden and most painful death. The last vacation was at hand, the journey to Fox How was to be taken in a few days, when he was seized with a fatal attack of spasm of the heart. Few biographies end more abruptly or more mournfully; but the sufferer met his death with perfect fortitude and the full hope of a Christian. He died June 12, 1842. His principal works are *five volumes of sermons;* the *History of Rome* (3 vols.), broken off by his death at the end of the second Punic war; and an *edition of Thucydides*. His miscellaneous contributions to literature are too numerous to be mentioned.

ARNOTT, Neil, M.D., was born in 1788 at Arbroath, but his family-home was Dysart, near Montrose, Scotland. He was educated at the Grammar School of Aberdeen, and subsequently at Marischal College in the same city, where he had the advantage of studying natural philosophy under Professor Copland, one of the most successful expounders of mechanical science then living. A. made choice of medicine as a profession; and after going through the medical course at Aberdeen, he went to London in 1806, where he became the pupil of Sir Everard Home, surgeon of St George's Hospital. After spending some years in the naval service of the East India Company, he settled in 1811 as a medical practitioner in London. In addition to his extensive general practice, A. was appointed, in 1815, physician to the French embassy, and afterwards to the Spanish embassy. In 1836, Dr A. was appointed a member of the senate of the University of London, then established by government. He was afterwards elected a fellow of the Royal Society, and then of the Geological Society. In 1837, he was named a Physician Extraordinary to the Queen.

In 1823—1824, Dr A. was induced to deliver a course of lectures on natural philosophy in its applications to medicine. The substance of these lectures formed the basis of his *Elements of Physics, or Natural Philosophy, General and Medical*, published in 1827. Of numerous new applications of physical science to medical practice, and to the alleviation of human suffering in general, invented by Dr A., may be mentioned the Water-bed (q. v.). But it is in connection with improvements in the warming and ventilating of houses that the name of Dr A. is most extensively known. In 1838, he published a treatise on *Warming and Ventilating;* and in 1855, another *On the Smokeless Fireplace, Chimney-valves*, &c. The 'Arnott Stove' and 'Arnott Ventilator,' which, with characteristic philanthropy and disinterestedness, Dr A. refrained from patenting, are noticed under Warming and Ventilation. In 1861, he published *A Survey of Human Progress*, full of interesting and enlightened views on improvement generally. In 1864, appeared Part I. of the long-promised revision of the *Physics;* this was followed by Part II., which contains the subjects of Optics and Astronomy for the first time, and also an interesting supplement entitled *Arithmetic Simplified*. A.'s last publication was a small work on national education. He died in London, March 2, 1874. In the year 1859 he expressed a wish to a friend to make a contribution to Marischal College, Aberdeen, in aid of a course of lectures on natural philosophy, to be available to young men not regular students of the university. The union of the two Aberdeen Colleges interfered with the project; and a few years later he gave £1000 to the united university, to provide a scholarship in natural philosophy. This was followed by the same gift to each of the other three Scottish universities, and, for Aberdeen, a further gift of £500 to the Mechanics' Institution. In London, Mrs Arnott had already given £1000 to each of two colleges for young ladies, to constitute scholarships for natural philosophy. In 1872, Dr A. intimated through Dr Lyon Playfair that he meant to repeat his gift to the Scottish universities; but, in consequence of a fall, his faculties had

manently impaired, and he was no longer of continued thought or decision. An of cold in 1858 had permanently affected ing; but otherwise, his last years were char- d by his usual flow of spirits. A.'s genius itself in a very unusual combination of inven- ver with the art of popular exposition. His mind was strongly towards human improve- every department of thought and conduct.

TTO, ARNATTO, ANNOTTA, AN- , or ROUCOU, also known on the continent e by the name of ORLEAN, is a red colouring h is obtained in South America and the from the reddish pulp surrounding the Arnotto-tree (*Bixa orellana*) by wash- n, fermentation, and subsequent evapo- pears in commerce in cakes or balls of ht, wrapped up in leaves, externally lly of a pale blood-red or yellowish- which have a peculiar animal smell gent taste. Pure A. seldom appears in It is obtained by the mere rubbing off of the red pulpy pellicle which covers ; but that which is thus obtained is very d occurs in small round or angular lozenges. lians rub this colouring matter into the skin whole body, thus intending both to adorn es, and to obtain protection against the mosquitoes. Amongst us, A. is used in for colouring plasters, ointments, &c.; and siderable extent by farmers for giving a our to cheese. It is also used in dyeing, loes not produce a durable colour. It to impart an orange tint to simple It is an ingredient in some varnishes. It in alkalies, producing a brown solution, it is precipitated yellow by acids. It colour to water, but dissolves in and sugar of lead throw down a pitate from the alcoholic solution. America, A. is very extensively mixed date, not only for the sake of the colour, for the improvement of the flavour.—The belongs to the natural order FLACOURT- v.), and is distinguished by complete with simple stigma, a hispid calyx of five and a two-valved capsule. The A. shrub is a tropical America, but has been introduced warm countries. It grows to the height and has heart-shaped pointed leaves, wers of a peach-blossom colour, which clusters at the extremities of the capsules are oblong, and contain eloped in red pulp (the A.). The be cordial, astringent, and febri- ots are used in broth. They have the A. in an inferior degree.

, one of the three departments of ovince of Westphalia (q. v.), having quare miles, and a population (1871) th the exception of the valley of the nose department belongs to the high- Lower Rhine. Only in a few of the re good arable soil; on the other a great deal of good timber, more d of the whole area consisting of forests. rincipal resources of the district are its riches, in coal, iron, lead, silver, &c. water-power has also led to the of numerous factories, mills, &c. chief town of the department, is Ruhr, 44 miles south-east from p. 4500. It has several manufactures, n, broadcloth, potash, &c. In the the castle is still pointed out the spot where the famous Femgerichte (q. v.) of A. was held.

ARNSTADT, the chief town in the principality of Schwarzburg-Sonderhausen, is situated in a picturesque country on the banks of the Gera, twelve miles south of Erfurt, and has a pop. (1871) of 8603. It is one of the oldest Thuringian cities, its existence being traceable as far back as 704 A.D. Formerly it was the chief emporium for the trade in fruit and timber between the fertile lowlands and the Thuringian forest region, but is now a manufacturing town, employing a very considerable number of hands in weaving, glove-making, brewing, pottery, &c. A rich vein of rock-salt has been recently discovered in the neighbourhood of the town, and a new copper-mine opened.

AROMA, a term sometimes employed to designate those substances the extremely minute particles of which are supposed to affect the organ of smell so as to produce particular odours, and frequently as synonymous with *odour*. The particles diffused through the atmosphere, and affecting the olfactory nerves - if the theory of particles of matter so diffused be correct—must indeed be extremely minute, as odoriferous substances such as musk, the smell of which is felt at a considerable distance, continue to diffuse their odour, and according to this theory, these particles, for years, without sensible diminution of weight. See SMELLING. The term A. is usually employed only with reference to particular kinds of odours, not easily defined or distinguished in words. Thus, we speak of the *A.* of roast-meat, and of the *A.* or *aromatic* smell of hyssop, mint, and other plants. Aromatic smells are very characteristic of some natural orders of plants, as *Labiatæ* (Mint, &c.) and *Compositæ* (Milfoil, &c.). They have been very generally supposed to depend upon essential oils, but resins are often equally aromatic.

AROMATIC VINEGAR differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, and *Acorus Calamus* (and sometimes camphor) to crystallisable acetic acid, or by distilling the acetate of copper in an earthen retort and receiver, and treating the liquid which passes over with the fragrant oils mentioned above. A. V. is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils, is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. A. V. is generally placed on a sponge in a smelling-bottle or in a *rinaigrette*; it can also be purchased as a liquid in phials; and a drop or two allowed to evaporate into a sick-room, overpowers, but does not destroy any unpleasant odour. The liquid must, however, be cautiously dealt with, as it is a very corrosive substance.

ARONIA. See CRATÆGUS.

AROOSTOOK, a river which, rising in the north of Maine, falls into the St John in New Brunswick, after a course of about 120 miles. It possesses a historical interest from its connection with the long-agitated question of the north-east boundary between British America and the United States.

ARPAD, the national hero of Hungary, was the son of Amos, the leader under whom the Magyars first gained a footing in Hungary. He was chosen duke on his father's death in 889, and by a course of incessant and mostly successful warfare with the Bulgarians, Wallachians, Moravians, &c., extended the first conquests of the Magyars on all sides. He also made more than one successful incursion into

Italy about 900, and returned laden with booty. He died in 907, leaving his son in possession of the supreme command. The A. dynasty became extinct in the male line with Andreas III. in 1301. A. yet lives in the popular songs of the country, and his history, even in the oldest chronicles, is mixed up with a deal of legendary matter.

ARPE'GGIO, in Music, a chord of which the notes are given, not contemporaneously, but in succession. From any one chord, several forms of A. may be produced. Bass-chords thus treated form an *Alberti Bass*, so named from Domenico Alberti (1730—1740), a popular singer and player, who often played the bass in this style.

ARPENT was the old French land-measure, corresponding to our acre. The name is from the ancient Gallic *aripennis*, which was identified by Columella with the Roman *actus*, or half *jugerum*. Almost every parish had an A. of its own. The comparative value of the three most in use will be seen in the following table:

	French Hectares.
Acre, English imperial or statute,	0·40466
Arpent, of Paris, ...	0·32400
" d'ordonnance, . . .	0·48400
" common, ...	0·40000

ARPI'NO, the *Arpinum* of the ancients, a town of Southern Italy, the birthplace of Cicero and Caius Marius, is situated in the province of Caserta, 65 miles north by east of Naples. It stands on the lower ridge of a lofty hill, some 6 miles to the left of the river Garigliano, the ancient Liris. The old town, in early Roman times, was built on the top of a steep rock, forming part of the territory of the Volscians. Many remains of the ancient structures are still to be seen, especially a cyclopean wall, which runs along the northern brow of the hill occupied by the present town, and extending to the ancient citadel. About the year 188 B.C., the citizens received the freedom of the city of Rome, with all its privileges, and Arpinum, during the later years of the republic, was a flourishing municipal town.

The population of A. is about 11,500. Manufactures of woollen cloth, parchment, paper, and leather are carried on. The town has a charming appearance from the highly picturesque character of the surrounding woods and mountains. Iron, white marble, variegated red marble, and marble of a yellowish colour, are got in mines and quarries in the neighbourhood.

A'RQUA, a village in the province of Padua, Venice, 12 miles south-west of Padua, in the heart of the Euganean Hills. Pop. 1200. Petrarch's furniture is still preserved in the house in which he died here (July 18, 1374), and his monument of red marble is to be seen in the churchyard.

A'RQUEBUS, or **HA'RQUEBUS**, was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the A. Many of the yeomen of the guard were armed with this weapon, on the first formation of that corps in 1485. The A. being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated the barrel; and the A. then obtained the name of the *haquebut*. Soldiers armed with these two

Arquebusier.

of weapon were designated *arquebusiers* and *buttes*—the former were common in the army in the time of Richard III., the latter that of Henry VIII.

ARRACA'CHA (*Arracacha esculenta*), a plant of the natural order *Umbelliferæ*, a native of the elevated table-lands in the neighbourhood of Santa Fe de Bogota and Caraccas, and of regions of similar climate in other parts of tropical America. It is much cultivated in its native country for its roots, which are used as an esculent. The root divides into a number of parts, which resemble cows' horns or large carrots. When boiled, they are firm and tender, with a flavour not so strong as that of a parsnip. The plant is very like hemlock, and has a similar heavy smell. Humboldt, indeed, referred it to the genus *Conium* (Hemlock), but it has since been made the type of a new genus. The flowers are in compound umbels, and are of a dull purple. The A. was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the Horticultural Society, and its cultivation persevered in for a time, but it has been found unsuitable for the climate of Britain and of other parts of Europe where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavourable to it. The climate of the south of Europe is not that of its native regions more than any of the British Islands. It seems to require a moist temperature and constant moisture. In Australia, and probably some parts of the British colonies in India, the A. would be found a very valuable plant. On deep loose soils, it yields a great produce. It is generally propagated, like skirret, by offsets from the crown of the root. By rasping the roots and washing, a starch, similar to arrowroot, is obtained.—There is another species of the genus, *A. moschata*, a native of the same countries, of which is uneatable.

Arracacha.

ARRA'CK, RACK, or **RAKI**, is the Indian name for all sorts of distilled

nors, but chiefly to that procured from toddy or
e fermented juice of the cocoa and other palms,
d from rice. The palms in other tropical
untries furnish a fermented beverage similar to
e toddy of India, and in a few instances also it is
tilled, but arrack essentially belongs to India
d the adjacent countries. The cocoa-nut palm
coos nucifera) is a chief source of toddy or palm
. and is obtained from trees ranging from twelve
en years old, or in fact at the period
begin to shew the first indication of
After the flowering shoot or spadix
in its spathe is pretty well advanced, and
ar is about to open, the toddy-man climbs
e tree and cuts off the tip of the flower-shoot; he
ties a ligature round the stalk at the base of
e spadix, and with a small cudgel he beats the
wer-shoot and bruises it. This he does daily for
fortnight, and if the tree is in good condition, a
nsiderable quantity of a saccharine juice flows
om the cut apex of the flower-shoot, and is caught
a pot fixed conveniently for the purpose, and
ied every day. It flows freely for fifteen or
n days, and less freely day by day for another
r more; a slice has to be removed from the
he shoot very frequently. The juice rapidly
and in four days is usually sour: previous
is a favourite drink known in India by
natives as callu, and to the Europeans as toddy.
our, it is distilled and converted into
ter to the Hindus by the name of
and by the Cingalese as Pol or Nawasi. A
ar spirit is made pretty largely from the
nificent fan-leaved palm, *Borassus flabelliformis*,
also from the so-called date-sugar palm, *Areuga*
saccharifera. Large quantities of arrack are made
om fermented rice prepared as malt—both in
ndia, Ceylon, and Batavia; in the last-mentioned
lace, sugar and molasses are also added to the
ice.

It is probable that the use of arrack is more
idely diffused among the human race than the
roduce of the vine (wine and brandy) and of barley
whisky, beer). The date-palm of the Sahara, the
il-palm of West Africa, and the cocoa-nut palm of
Pacific Islands are made to yield it.

unscientific method of preparing these
lcoholic spirits renders them generally very dis-
steful to European taste, the process of rectifica-
ion being rarely if ever employed. Some care-
ully prepared samples of great age, however, find
avour, and are used in making punch and other
rinks, not only in India and Java, but small
uantities also find their way to Britain, for the
ratification of palates trained in India. The cocoa-
ut tree is especially valuable for this industry,
ecause it bears twelve times in the year after it
nce begins, and continues to do so for as much as
orty years. It is the rule, therefore, to pre-
ent undue exhaustion of so valuable a tree, to dis-
ontinue the collection of juice at intervals, and
llow the natural process of fruit-bearing to go on:
n this way, it is usual to divide the year between
he two crops. Of late years a considerable amount
f rum has been produced in the East Indies from
he sugar-cane, and the molasses yielded by it. This
s often called arrack by the natives, and leads to
rrors as to the statistics of the latter material.
The word Saki, used by the Japanese for rice spirit,
eems only an alteration of *Raki* or arrack. An imi-
ation A. is prepared by dissolving benzoic acid
n rum, in the proportion of 20 grains of the former
o 2 pounds of the latter.

ARRAGONITE, a mineral essentially consisting
f carbonate of lime, and so agreeing in chemical
omposition with calcareous spar (q. v.), but differing from it in the form of its crystals, of which the primary form is a rhombic prism with angles of 116° 16′ and 63° 44′, the secondary forms being generally prismatic and pyramidal. The effects of heat on them shews another difference, A. being reduced to powder by a heat in which calcareous spar remains unchanged. Such differences between minerals of the same chemical composition appeared very improbable, and when Stromeyer, in 1813, detected the presence of a little carbonate of strontia in A., they were immediately ascribed to this as their cause; but it has since been shewn not only that the quantity of strontia is very small, variable, and therefore to be regarded as accidental, but also that the differences between the two minerals may be accounted for by difference of temperature when crystallisation was taking place. A. appears to be the product of a crystallisation taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighbourhood of hot springs, as at Carlsbad. It is frequently found in trap-rocks, as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs stalactitic. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystals (*macles*) are very common. *Satin Spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i. e., flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

A'RRAH, a town in the district of Shahabad and the presidency of Bengal, in lat. 25° 31′ N., and long. 84° 43′ E. It is situated in a fertile country, and contains, according to the census of 1871, a pop. of 39,386. It is on the route between Dinapore and Ghazeepore, 25 miles W. of the former, and 75 E. of the latter. During the mutiny of 1857, A. became in variety and intensity of interest second only to Cawnpore, Delhi, and Lucknow, connected as it was with a heroic defence, a heavy disaster, and a brilliant victory. The defence was that of an isolated house, for eight days, against 3000 sepoys with 2 field-pieces, the garrison consisting of less than 20 whites, all civilians, and 50 Sikhs, whose fidelity perhaps was doubtful till proved by trial. The disaster was the nocturnal surprise in the jungle of a detachment almost entirely European, sent to the relief of the beleaguered dwelling—the loss having been 290 out of 415. The victory was won by a force of 172 men, 12 of them mounted volunteers, and 3 guns, over a host numbering nearly 20 to 1. In fact, A., happily with the exception of the cold-blooded massacre of women and children, presented, in miniature, nearly all the phases of the most formidable and eventful insurrection on record. For a detailed account of these events, see *Chambers's History of the Indian Revolt.*

ARRAIGN'MENT, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. And having the presumption of innocence in his favour, it is the law, and so laid down in the most ancient books, that, though charged upon an indictment of the highest nature, he is entitled to stand at the bar in the form and in the garb of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner is called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at

the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of *Not guilty*. Formerly, one of the incidents of the A. was the prisoner *standing mute*, as it was called—that is, refraining from, or refusing, a direct answer to the indictment; in which case the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God, and to deal with him accordingly. But by the 7 and 8 Geo. IV. c. 28, s. 2, it is enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officer to enter a plea of 'Not guilty,' on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. Where there is reason to doubt, however, that the prisoner standing mute is sane or not, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of 'Not guilty' is entered, and the trial goes on; but if the negative, the insane person will be ordered by the court to be kept in strict custody during Her Majesty's pleasure, according to the 39 and 40 Geo. III. c. 94, s. 2.

By 19 and 20 Vict. c. 16, facilities are provided for the trial of prisoners in the Central Criminal Court, although the offence may have been committed out of the jurisdiction of that tribunal, and it directs the A. to take place in the ordinary form.

In the Scotch criminal law, the expression *Calling the Diet* corresponds to A. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, which he does, as in England, by a plea of 'Guilty' or of 'Not guilty;' in the event of which latter, the trial proceeds—the prisoner, either by himself or his counsel, having always the last word before the court and before the jury. In this respect, it is only so in England in some cases.

According to Sir Matthew Hale, the term A. is derived from *arraisoner, ad rationem ponere*, to call to account or answer, which in ancient French law would be *ad-resoner*, or, abbreviated, *a-resner*. See TRIAL, INDICTMENT, INFORMATION, PROSECUTION, PLEA, VERDICT, NOT PROVEN.

A'RRAN, an island in the mouth of the Firth of Clyde, Scotland, about 5 miles south-west of Bute, 13 west of Ayrshire, and 4 east of Cantire, from which it is separated by Kilbrennan Sound. It is of an oval form, about 20 miles long and 12 broad; area, 165 sq. miles, about 15,000 acres, or a seventh part, being cultivated. Pop. (1871) 5234. The general aspect of A. is mountainous and heathy, and in the north, the jagged peaks are singularly grand. Around the coast is a low belt of ground, with lofty cliffs on the south and south-west shore, from which the country rises abruptly. The highest point is Goatfell (an English corruption for Goath-Bhein, 'Wind Mountain'), an obtuse pyramid, 2865 feet high, and a prominent feature in the island. From its sides slope the romantic glens of Rosa and Sannox, and at its base to the south-east opens Brodick Bay, at the head of which lay, until lately, Brodick village. The houses which composed it have now been removed, and a new village has sprung up on the opposite side of the bay, called Invercloy, where there is a spacious hotel. To the south of this, round a bluff headland, is Lamlash Bay, the chief harbour of A., and the best on the Firth of Clyde, sheltered by Holy Island, once the seat of a monastery. A picturesque mass of columnar basalt, 900 or 1000 feet high, succeeds. Further south lies Whiting Bay, near which are two cascades 100 and 50 feet high respectively. At the south-east point of A. is Kildonan Castle, opposite which is the small isle of Pladda, crowned by a light-house. Large caverns occur in the cliffs of the south and south-west coasts. In one of these, the 'King's Cave,' in the basaltic promontory of Druimodune, Robert the Bruce hid himself for some time. Shiskan Vale, opening into Druimodune Bay, is the most fertile part of A. Loch Ranza, a bay in the north end of A., runs a mile inland, and is a herring-fishing rendezvous. There is daily communication with A. by means of steam-boats from the Clyde, the ports touched at being Brodick and Lamlash.

The geology of A. is almost unique, and displays a greater succession of strata than any other part of the British Isles of equal extent. The south-east half of A. consists of Devonian sandstone, extending from the east coast 4 or 5 miles inland, and running south-west from Brodick beyond the centre of the island; and of trap rocks and carboniferous strata, which occupy the middle and western portions. The north-west half consists of a central granite nucleus, including Goatfell, bordered on the west by a tract of mica-slate, and on the north, east, and south by lower Silurian rocks, which, again, have a run of Devonian sandstone on the east and south. Lias and oolite lie on the mica-slate. There are only rivulets in A., and one of them tumbles over a precipice 300 feet high. Some level parts in the south half of A. are fertile. The chief crops are oats and potatoes. Cattle, sheep, fish, and oats are exported. The greater part of A. belongs to the Duke of Hamilton, whose seat is Brodick Castle. A. forms part of the county of Bute, and contains two parishes. Many antiquities occur, such as cairns, unhewn obelisks, monumental stones, and Druidical circles. Several stone coffins were found in a cairn 200 feet in circumference. Loch Ranza Castle, now in ruins, was formerly a residence of the Scottish kings.

A'RRAN, SOUTH ISLES OF. These are three small islands lying N.E. and S.W. across the entrance to Galway Bay, about 4 miles off the W. coast of Ireland, and 27 west of Galway city. They form the barony of A., and give the title of Earl to the Gore family. Total area, 11,287 acres. The principal or west island, Inishmore, is 7 miles long and 2 broad; Inishmaan, or 'Middle Isle,' comes next; and then Inishere to the S.E. Pop. in 1871, 3050, of which number 2122 inhabited Inishmore, 433 Inishmaan, and 495 Inishere. Of the total pop. all but 57 were Roman Catholics; 504 could read and write, 143 could read only, and the rest were illiterate. The islands consist of the carboniferous limestone of the bed of Galway Bay, and rise to the height of 100 to 200 feet on the west side, ending in cliffs facing the Atlantic. Most of the land is rudely cultivated. The chief crops are rye, oats, and potatoes. Most of the inhabitants engage in fishing; and the *corragh* or wicker-work skiff is still to be seen here. They are subject to famines from parching rainless west winds in August destroying the potato-crop. These islands contained at one time 20 churches and monasteries. Inishmore was the centre of these, still known as Aran-na-naomh, or 'Arran of the Saints.' Many pilgrims still visit the old shrines and relics scattered through the islands. St Kenanach Church, built in the 7th c., still exists, all but its stone roof, as well as the stone oratories and little bee-hive stone huts of the monks of the 6th and 7th centuries. There are nine circular cyclopean fortresses of unknown

stones (portions of the walls still being
posed to have been built in the 1st

France. A. suffered much in the time of the first
French revolution, especially in the year 1793.
Robespierre, the Terrorist, was a native of the town.

ARRAYER, a title given to certain military
officers in England in the early part of the 15th c.
There were two of them in each county, sometimes
called Commissaries of Musters. Their duties were
set forth in an ordinance of Henry V., from the
terms of which it appears that the arrayers were
army inspectors, or, rather, militia inspectors, and
in some sense precursors to the modern lords-
lieutenant of counties.

ARREST is a legal term used both in criminal
and civil process. Criminal A. has already been
sufficiently considered under the word APPREHEND
(q. v.); and in civil procedure it may be simply
defined to be the execution of a judicial or preroga-
tive order, by which the liberty of the person may
be restrained, and obedience to the law compelled.
In the practice of the Court of Chancery, a defendant
may be arrested for his contempt in not putting in
his answer to a bill filed against him; and persons
in all the superior courts may be arrested or
attached for contempt. But in its ordinary legal
acceptation, A. is used to signify the enforcement
of the judgment or order of a court of law, in order
to satisfy justice. In the execution of such judg-
ment, the party against whom it has been given
may be arrested by means of a writ of *capias ad
satisfaciendum*, or a *ca. sa.*, the purpose of which
is to imprison the body of the debtor till he pays
the debt or damages and costs. It is directed to
the sheriff, commanding him to take the body of the
debtor, and have him at Westminster immediately
after execution thereof, to make the plaintiff satis-
faction for his demand. This writ might, at one
time, issue for a judgment debt of any amount;
but by very recent statutes it was provided
that it shall not issue in the case of a debt not
exceeding £50, exclusive of costs; subject, however,
to this proviso, that where such debt should appear
to the judge trying the cause (being a judge of the
superior courts, or a barrister or attorney) to have
been incurred under false pretences, or with a fraud-
ulent intent, or without a reasonable assurance of
being able to pay or discharge the same, it shall be
lawful for such judge to order the defendant to be
taken and detained in execution upon such judg-
ment, as if the act had not passed. This has since
been adopted as the general law applicable to debts
of any amount, and the abolition of imprisonment
for debt was effected by the Debtors Act, 32 and
33 Vict. c. 62. No person, after 1869, can be im-
prisoned in England for making default in payment
of a sum of money except in a few rare cases; such
as when a court has ordered a sum of money to be
paid, and it is not paid, and the debtor has since
acquired the means to pay it, but refuses. In such
cases, the judge may order the debtor to be com-
mitted to prison for six weeks or less until the
money is paid. So that under this statute of 1869
none can be imprisoned for debt except for some
special cause resembling fraud; and even then the
imprisonment is limited to one year.

A defendant may also be arrested under a writ of
capias ad respondendum, which issues as follows—
where a plaintiff swears by affidavit that he has a
cause of action against a defendant to the amount
of £50 or upwards, or has sustained damage to that
amount, and that there is reason for believing that
the defendant is about to quit the country, an order
is made by a judge—and such order may be made at
any time between the commencement of the action

and final judgment—when the writ in question issues, directing the sheriff to arrest the defendant, who remains in custody until he has given security in respect of the plaintiff's demand. But this imprisonment cannot exceed six months in any case. Formerly, a defendant might be arrested on what is called mesne process, that is, process issuing at the commencement and during the progress of a suit; but by recent statutes, such A. is abolished, excepting as above explained.

Under such and similar authority, A. may be made of the person. There are classes, however, who are exempted by privilege from A.—thus, ambassadors and other diplomatic representatives of foreign courts; all members of the peerage, Scotch and Irish as well as English; all members of parliament; all persons connected with a cause before a court of justice, and attending in the course of it, such as witnesses, attorneys, and barristers—although in regard to the latter (barristers), it may be more correctly stated that they are entitled to the privilege only when attending the *superior* courts; and Mr Archibold, in his Practice of the Common Law, refers to a case where a barrister was discharged who was arrested on circuit. The Queen may also, by her writ of protection, privilege any person in her service from A. during a year and day, a prerogative, however, which is seldom, and, at the present day, scarcely ever exercised. In regard to parliamentary exemption from liability to civil process, however, the privilege does not preclude the process from issuing, it only protects the *person* of the member himself; for by 10 Geo. III. c. 50, it is enacted that any action or suit may at any time be brought against any person entitled to privilege of parliament; and that no such process shall at any time be impeached or delayed by pretence of any such privilege, except that the person of a member of the House of Commons shall not thereby be subjected to any arrest or imprisonment. It is likewise provided by the Bankruptcy Act, 1869 (32 and 33 Vict. c. 71, s. 120), that if a person having privilege of parliament commits an act of bankruptcy, he may be dealt with as if he had no privilege. When he is adjudged a bankrupt, he will for one year following be deemed incapable of sitting in parliament unless he satisfy the creditors, and if he do not, then his seat becomes vacant. But now, as all persons, including peers, may be made bankrupt, none is liable to arrest unless he in some way thwart the proceedings in bankruptcy or abscond.

In the Scotch law, the word A. is not a technical term for process against the person. But see ARRESTMENT, and ARRESTMENT FOR FOUNDING JURISDICTION.

ARREST OF JUDGMENT, in the practice of the English common law courts, was an expedient after verdict on the part of an unsuccessful defendant, who endeavoured to get the judgment arrested or withheld, on the ground that there was some error which vitiated the proceedings; and if this objection succeeded, it was fatal, no amendment being allowed after trial. But as this rule was found to be productive of great inconvenience, expense, and often injustice, it has been considerably modified by the Common Law Procedure Act of 1852 (the 15 and 16 Vict. c. 76), under which, omitted facts or other matter may, by leave of the court, be suggested, by which the error may be corrected. See JUDGMENT.

ARRESTMENT, in the Scotch law, is the legal process or diligence, as it is called, by means of which a debtor, where the debt is of a personal nature, is prohibited from making payment or delivery to his creditor until another debt or claim due to the person making use of the arrestment by such creditor is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the arrestee; C, the user of the arrestment, is called the arrester; and B, the arrester's debtor, is called the common debtor. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called *an action of furthcoming*, is necessary, decree in which operates as a complete transfer to the arrester. This process may be sued out either by authority of the Court of Session or by that of an inferior judge. The procedure is now regulated by the 1 and 2 Vict. c. 114, ss. from 16 to 22 inclusive.

The corresponding English term is ATTACHMENT OF DEBTS (q. v.).

ARRESTMENT FOR FOUNDING JURISDICTION. This is a form of proceeding in the practice of the Scotch law, and it is of an extremely important nature, for, by means of it, a foreigner, or one beyond the jurisdiction of the courts of Scotland, who happens to have any property in that country, may be sued in the Scotch tribunals. It is a personal remedy, and the mode of procedure is thus: The summons (or declaration, as it would be called in England), which is executed by [illegible] a copy in the proper office in Edinburgh, [illegible] in express terms a warrant to arrest *ad fundandum jurisdictionem;* and when served on the [illegible] having possession of the foreigner's property, [illegible] warrant has the effect of attaching it, so as to give the court jurisdiction over the foreigner himself. This manner of founding jurisdiction is said to [illegible] been borrowed by the Scotch from the [illegible] the Netherlands, and it can be traced [illegible] practice of the Scotch courts for [illegible] century. In a recent case, however, [illegible] by appeal to the House of Lords from Sc[illegible] attempt was made to shew, that for this [illegible] A. there was no sufficient authority in [illegible] that country, and it was represented to the [illegible] as a barbarous contrivance of comparatively introduction. But their lordships had no hes[illegible] in affirming the judgment of the Court of S[illegible] A like practice exists in London, called attachment, but is peculiar to the city.

ARRESTMENT OF WAGES is supp[illegible] exercise a baneful influence on some of the w[illegible] classes in Scotland, by putting th[illegible] greedy and oppressive dealers. [illegible] ledge of the power they thus p[illegible] give credit to working-people, [illegible] them in extravagance. It was the much complaint in Glasgow, that a inquiry was instituted into its operat[illegible] That inquiry developed a sad amount of gance and folly, but did not afford a hope mere alteration in the machinery of [illegible] remedy a deep-rooted social evil. features were found in the f[illegible] population, the younger of wl[illegible] avidity for fine clothes, were t[illegible] ful organisation of dealers, on wha[illegible] ticket system. It is not, however, arrest wages in summonses for small [illegible] under £12. Moreover, the wages of all and workpeople were declared by [illegible] Vict. c. 63, to be exempt from [illegible] except where there was a surpl[illegible] per week. In England, wages cannot be for debt except in one or two exceptio[illegible]

ATHERUM, a genus of Grasses, SOFT-GRASS) and *Avena* (see

OAT), and distinguished by a lax panicle, 2-flowered spikelets with two glumes, the lower floret having stamens only, and a long twisted awn above the base; the upper floret perfect, with a short straight bristle below the point.—The name A. is from the Greek *arrhen*, male, and *ather*, an awn. *A. avenaceum* (*Avena elatior* of Linnæus, also known as *Holcus avenaceus*) is a common grass in Britain. It is sometimes called OAT-LIKE GRASS, from the resemblance to the coarser kinds of oats in the general appearance of the panicle. In France, it is very much cultivated for fodder, and is often called FRENCH RYE-GRASS. It has, however, no affinity to the true Rye-grass (*Lolium*). It is a tall perennial grass, 2–3 feet high, becomes luxuriant early in the season, and continues long productive. It is, however, a rather coarse grass, and has a somewhat bitter saline taste; it is not so acceptable to cattle as many other grasses, and is therefore generally regarded by as unworthy of cultivation on it is found suitable for some situations, and to form a coarse in plantations.—A variety or ing from it in having a knotted to the stem, instead of a simple fibrous by some botanists *A. bulbosum*. It is in Britain, but is a very inferior grass, the character of its roots, difficult of on lands in which it appears as a weed.

US, FLAVIUS, a native of Nicomedia, in about 100 A.D. He became a disciple the Stoic philosopher, and, under his warm advocate of that system. On to the public the earliest products of his ed men of Athens were highly pleased nd honoured him with the freedom of had chosen Xenophon as his model of hence the Athenians called him phon. In 124 A.D. he was introHadrian in Greece, who conedom of the eternal city. He prefect of Cappadocia in the year Antoninus Pius, the successor of promoted to the consulship. But some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place. As the pupil and friend of Epictetus, he edited the Manual of Ethics (*Encheiridion*) left by his master, and wrote the *Lectures of Epictetus*, in eight books, of which only four have been preserved—to be had in Schweighäuser's *Philosophiæ Epicteteæ Monumenta*, vol. iii. (Paris, 1827). He wrote also *The Conversations of Epictetus*, a work which has been lost, except a few fragments. The most important work by A. is the *Anabasis of Alexander*, or *History of the Campaigns of Alexander the Great*, which has come down to us entire, all but a gap in the 12th chapter of the 7th book. This book is our chief authority on the subject of which it treats, and is a work of great value. In close connection with it, A. wrote his *Indian History*, giving an account of the people of India. Other writings by A., his letter to Hadrian on *A Voyage round the Coasts of the Euxine Sea*, and another, *A Voyage round the Coasts of the Red Sea*, are valuable with regard to ancient geography. There is still another work by our author—a Treatise on the Chase (*Kynegeticos*)—in which, as well as in the *Anabasis*, he has imitated Xenophon.

A. was one of the best writers of his day. His works bear the marks of care, honesty, and correctness; and they were numerous, though several have not been handed down to our time. All that we are possessed of appear to have had translations into Latin. There is a good French translation of the *Anabasis* by Chaussard, with commentary, 3 vols. (1802), and also a good one of the *Lectures of Epictetus* by Thurot (1838). The best critical edition of A. is that by Müller (Paris, 1846).

ARRO'BA, a weight commonly used in Spain, Portugal, Brazil, and in the principal Spanish and Portuguese colonies. In the first of these countries, it is equivalent to the English quarter of a cwt., or 28 lbs.; it is nearly the same in Portugal, &c. In Spain, the A. is also a measure for wine, brandy, &c., and contains four of our quarts.

ARRONDISSEMENT (from the French *arrondir*, to make round), the subdivision of a French Department (q. v.).

ARROW. See BOW AND ARROW.

A'RROWHEAD (*Sagittaria*), a genus of plants of the natural order *Alismaceæ*, distinguished by unisexual flowers, having three herbaceous sepals and three coloured petals, numerous stamens, and numerous carpels, which are compressed, one-seeded, and on a globose receptacle. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world.—The COMMON A. (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid bulbs), dried and powdered, have sometimes been used for food, but have an acrid unpleasant taste.—The CHINESE A. (*S. Sinensis*) is a native of China, and has long been cultivated in that country and Japan for its eatable corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves, and a branched polygonal scape (leafless stem). It is grown in ditches and ponds. It is one of the plants sometimes cultivated in tanks in the hot-houses of Britain.

ARROW-HEADED CHARACTERS. See CUNEIFORM.

ARROW-HEADS. See ELF-ARROW-HEADS.

A'RROW-ROOT is a variety of starch extracted from the roots of certain plants growing in tropical

countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for children and invalids. It is obtained from the tuberous roots—or more correctly, the root-stocks (*rhizomes*)—of different species of the genus, *Maranta*, belonging to the natural order *Marantaceæ*, and characterised by solitary ovules, a fleshy style curved downwards, branching stems, and white flowers. The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India Islands, and growing about two feet high, with ovato-lanceolate somewhat hairy leaves, clusters of small flowers on 2-flowered stalks, and globular fruit about the size of currants. The roots (or rhizomes) contain a large proportion of farina. They are often more than a foot long, of the thickness of a finger, jointed, and almost white, covered with pretty large paper-like scales. They sometimes curve so that the points rise out of the earth, and form new plants. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. Mills for this purpose have been introduced; but in Jamaica the roots are usually reduced by beating in deep wooden mortars; in Bermuda, by means of a wheel-rasp. The pulp is then mixed with much water, cleared of fibres, by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch

Arrow-root (*M. arundinacea*).
a, tubers; *b*, leaf and flowers; *c*, stamen and style.

quickly settling down as an insoluble powder. Successive washings are employed for further purification. The A. is finally dried in the sun or in drying-houses, great care being taken, by means of gauze, to exclude dust and insects. The careful peeling of the roots is of great importance, as the skin contains a resinous matter, which imparts a disagreeable flavour to A. with which it is allowed to mix. Great care is taken to preserve the A. from impurities; and the knives used in peeling the roots, and the shovels used in lifting the A., are made of German silver. The West Indian A., most esteemed in the market, is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian A. is not in general so highly valued, pe

because substitutes for the genuine A. quently receive that name. The *Maranta ar* is now, however, cultivated to some exten the East Indies and in Africa. *M. Indic* was supposed to be distinct from *M. arund* now regarded as a mere variety of it, with smooth leaves. It is cultivated both in Indies and in Jamaica. A. is obtained *M. Allouyia* and *M. nobilis* in the West I from *M. ramosissima* in the East.

The amount of fecula or starch presen roots of the *Maranta* varies according to runs from 8 per cent., in those of the you to 26 per cent. when full grown. The la is reached when the plant is 10 to 12 mo and the roots then present the following c in 100 parts:

Starch, fecula, or arrow-root,	. .
Woody fibre,	. . . . .
Albumen,	. . . . .
Gummy extract, volatile oil, and salts,	
Water,	. . . . .

A. is exported in tin cases, barrels, carefully closed up. It is a light, opaq powder, which, when rubbed between th produces a slight crackling noise, like th when newly fallen snow is being made ball. Through the microscope, the seen to be convex, more or less ellip obscurely triangular, and not very The dry farina is quite inodorous, solved in boiling water, it has a slight smell, and swells up into a very perf Potato-starch, with which it is often ad may be distinguished by the greater si particles, their coarser and more distinct ri their more glistening appearance. Refined s is used for adulteration, many of the pa which have a truncated extremity, and thei is irregular or tuberculated. A. is also s adulterated with rice-starch and with the starch of wheat-flour.

Not less than 400,000 lbs. of A. are imported into the British Isles. As an diet, it is often prepared for invalids and by merely dissolving it in boiling-water and ing with sugar, lemon-juice, wine, &c. It is a prepared with milk, made into puddings, &c most simply prepared, it forms a light mea however, is not very nutritious. See NUTRI

A farina somewhat similar to A., an known by the distinct name of *Tous-le* obtained from some species of the allie *Canna* (q. v.). But East Indian A. is obtained from the tubers of *Curcuma ang* Other species of *Curcuma* (see TURMERIC *Zerumbet*, *C. leucorhiza*, and *C. rubescens*, a a similar farina; the same tubers which, whe yield a beautiful and pure starch, yielding when old. In Travancore, this starch is a part of the food of the inhabitants. Th tubers of the Galangal (q. v.), (*Alpinia G* another plant of the same natural order (*Sci* are another source of this farina.—A fa what resembling A., and often sold under is obtained from different species of order *Cycadaceæ*, as from the dwarf f of *Zamia tenuis*, *Z. furfuracea*, and *Z. pum* West Indies, and from the large seeds of *D* in the lowlands of Mexico.—The starch Cassava, Manihot or Manioc (see MANIOC), times imported into Europe under Brazilian A. II., and ruled for thirty-seven years, whence we may conclude that many of the acts attributed to the founder of the Parthian kingdom were the work of his successor.

ARSACES VI., or MITHRIDATES I., flourished about the middle of the 2d c. B.C. He enlarged the territories of the Parthians by the conquest of Bactria; and is even supposed to have penetrated into India, and subdued the nations between the Hydaspes and Indus. In the year 138 B.C., he defeated and took prisoner Demetrius Nicator, king of Syria, whom, however, he treated generously, bestowing on him his daughter in marriage. He was a just and merciful prince, and an enemy to luxury.

A'RSENAL is the name given to a great military or naval repository, where the munitions of war are to some extent manufactured, but more particularly stored until required for use. Every royal dockyard, every magazine, every armoury, is to some extent an A.; and therefore the meaning of the word is not quite definite. In France, the chief arsenals are at Cherbourg, Brest, and Toulon. In England, although Deptford is a considerable storehouse for naval clothing and provisions, and Weedon and the Tower great repositories for military stores, the only establishment vast enough to deserve the name of A. is at Woolwich. This is truly a remarkable and important place. In the spring of 1859, when war was raging in Italy between the French and Sardinians on one side, and the Austrians on the other, and when an uneasy feeling pervaded our own country, there were for a short time more than 10,000 men employed in Woolwich A. There were at that time nearly 12,000 pieces of iron ordnance in store, of which 7000 were of modern make and of heavy calibre. This store was supplementary to that which is always kept at the dockyards of Woolwich, Chatham, Sheerness, Portsmouth, Plymouth, and Pembroke. There were resources at the A. for bringing forward, fitting, and issuing these reserve guns at the rate of 200 per week, or double this number on an emergency; and many hundreds were within a brief period shipped thence, to strengthen our forts in the Mediterranean, in the colonies, and around the coasts. All the shot and shell used down to the period of the Crimean war, were ordered of private makers; but the charge was so enormous during the early months of that war, that the government resolved to try the manufacture at Woolwich; this was done, with a very manifest saving of expense. It has been calculated that the A., when at full work, could produce large shot and shell with six times the rapidity with which those missiles were used by the British outside Sebastopol during the eleven months' siege. These observations do not apply to rifles or muskets; none of these weapons are made at Woolwich. There have been times, however, during the year 1859, when nearly a *hundred million* rifle-bullets were in store at the A. The Arsenal is divided into two great sections, of which the one is the depot for the storage of arms and all military equipments, whether for land or naval service; the other being occupied by the manufacturing departments. The latter comprise the gun factories, where all cannon are made; the carriage department, for gun-carriages and all means of transport; and the laboratory, whence come all cartridges, shot, shell, bullets, and warlike weapons.

A'RSENIC is the name applied in popular language to a well-known poisonous substance, Arsenious Acid (q. v.), but, strictly speaking, the

term is restricted to a metallic body which in part enters into the composition of the poison. The metal A. is rarely found free in nature, but in a state of combination it occurs largely (see ARSENICAL MINERALS). The metal is generally prepared from arsenious acid (AsO_3) by mixing it with its own weight of charcoal, placing the mixture in a well-covered crucible, and subjecting the whole to heat, when the metal set free by the charcoal rises, and condenses in the upper part or cover of the crucible. Metallic A. is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system, it is there faintly

Native Arsenic.

acted upon by the juices, and in part dissolved, at the same time, exhibiting poisonous properties. When heated in the open air, it burns with a peculiar bluish flame, and emits a characteristic alliaceous odour. The only use to which the metal A. is applied in the arts is in the manufacture of leaden shot of the various sizes, when its presence in small quantity in the lead renders the latter much more brittle than it ordinarily is. Of all the compounds of A. the most important is the one already alluded to—namely, Arsenious Acid, which is an oxide of A. With sulphur, A. forms two important compounds: *Realgar* (AsS), a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *White Indian Fire;* and *Orpiment* (AsS_3) or *King's Yellow*, a cheap pigment of a yellow colour. With hydrogen, A. forms arseniuretted hydrogen (AsH_3), a very poisonous gas, and one which has been fatal to several chemists.

ARSENICAL MINERALS occur chiefly in primitive rocks, and frequently associated with other metalliferous minerals.—*Native Arsenic*, although nowhere very abundant, is not unfrequently found in mines in Europe, Asia, and America, generally along with sulphur and metallic sulphurets. In Britain, it occurs at Tyndrum in Perthshire. It has usually a fine granular character. It is very seldom, if ever, quite pure, usually containing a little antimony and iron, and not unfrequently a very little silver or gold.—A very similar, and still rarer mineral, found in similar situations, is known as *Arsenic-antimony*, and consists of about two parts of metallic arsenic, and one of metallic antimony.—*Arsenic-silver*, or *Arsenical Silver*, is another very rare mineral, consisting chiefly of arsenic and iron, but containing also about 13 per cent. of silver and a little antimony.—*Arsenic-glance*, found at Marienberg in Saxony, and containing about 3 per cent. of bismuth, has the remarkable property of taking fire at the flame of a candle.—*Arsenious Acid* oc a few localities in Germany and F mineral species, has received the which perhaps too closely res designation of its salts.—*Arsenic Acid*, pound of arsenic and oxygen (AsO_5), co oxygen than arsenious acid, although itself occur native, is not unfrequent in compounds with copper and lead (*Arse* per and lead), which enter into the c number of minerals, none of them so be of any importance.—Among A. M. ranked the compounds of arsenic with ticularly *Orpiment* (q. v.), *Realgar* (q. v.) *phine*, a rarer mineral than the other tw fore less important.—But the most imp A. M., because of their use as ores of ar preparation of white arsenic, or arseni those in which arsenic is combined wit cobalt. One of these is *Arsenical Pyri pyrite*, found in various mines of the Europe, and containing arsenic, iron, and cobalt, in somewhat various pr arsenic, however, always the principal It generally occurs massive.—*Mispick* quently occurs in rhombic crystals, massive, differs from it in containing quantity of silver, so that it is used both arsenic and of silver. It is found in tin-mines of Cornwall, and is pretty different parts of the world.—*Nickelin* nickel and arsenic, and is used as an and also for the preparation of white *tine* and *Smaltine*—the former con sulphur, and arsenic; the latter, arsenic—are used for the preparation of for porcelain and stoneware. Both a Cornwall; they occur also in some of the continent of Europe, and in other world.—The presence of arsenic in a commonly be detected by the allia which it emits before the blow-pipe.

ARSENIOUS ACID is the arsenic most familiarly known. It is obtai during the roasting of the arsenica. Germany in furnaces communic When the arsenic of the ore burns condition of A. A. there meets the oxygen of the air,
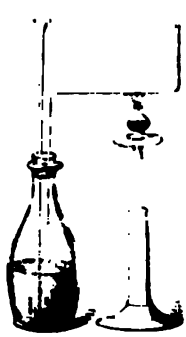
ich combines, forming A. A. (AsO_3), and
itself on the inner surface of the cool part of the tube in little glistening crystals. On allowing the tube to cool, adding water thereto, and applying heat, the water dissolves the crystals of A. A., yielding a solution, to separate portions of which the liquid tests mentioned above may be successfully applied. This process may likewise be employed in the detection of A. A. in animal tissue, as in the liver, spleen, kidneys, &c., by first dividing the animal matter into small pieces, and thereafter treating with water, hydrochloric acid, and copper. The precautions which require to be exercised in trying this process are, that the hydrochloric acid and copper are themselves free from A. A. Hydrochloric acid has long been known to be liable to contain at times a very sensible proportion of the poison, and it is therefore necessary, before using the acid in any experiment, to make a preliminary trial with dilute hydrochloric acid, into which, when heated, a piece of copper is immersed; and if no tarnishing occurs after a quarter of an hour's trial, the acid may be declared free from contamination with arsenical compounds. The liability of copper to contain arsenic some years ago (August 1859) assumed importance in connection with a trial for murder by slow poisoning with arsenic, which took place in Britain. In this case, a considerable amount of copper was dissolved during the testing, and supplied the poison in quantity enough to produce a faint coating on a piece of copper which was subsequently introduced into the liquid. The result was that A. A. was at first declared to be present in the material under examination; but further experiments demonstrated that the copper itself had afforded the arsenic. To free copper from any arsenic which it may contain originally, it is only necessary to heat the copper over a gas or spirit-lamp flame, when the arsenic volatilises, and leaves the copper uncontaminated therewith.

The other two processes for the detection of A. A. in organic mixtures are—1. That recommended by Marsh, in which the material is treated with dilute sulphuric acid and metallic zinc in



1. Marsh's process.

2. Berzelius's process.

a gas-generating apparatus, when the arsenic combining with hydrogen, forms arseniuretted hydrogen (AsH_3), from which, in the act of escaping, the metallic arsenic, and subsequently A. A., can be obtained; and 2. That known as Berzelius's process, in which dry arsenical compounds are mixed with a reducing flux, and heated in a constricted tube, when the metal arsenic is produced, which in its turn is converted into A. A. by heating in a wide test-tube. The processes of Marsh and Berzelius are not so generally followed as that of Reinsch; but in each and all it is absolutely

necessary, in order to avoid the possibility of mistake, (1) that metallic arsenic be obtained from the organic mixture; (2), that the metallic arsenic be converted into A. A.; and (3), that this A. A., treated with water, should yield a solution which will give the three liquid tests mentioned previously.

A. A. forms compounds (salts) with alkalies and other bases, which are called Arsenites. Some of these are employed in commerce and medicine. A. A., boiled with a solution of potash, or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's Solution*. The more largely used sheep-dipping mixtures are composed of A. A., soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of A. A. and the oxide of copper, called the arsenite of copper, or *Scheele's Green*, is a pigment largely used by painters as a pretty and cheap green paint. The same substance is extensively employed in the manufacture of common green paper-hangings for the walls of rooms; and recent inquiries would lead to the belief that rooms covered with paper coated with this green arsenite of copper, are detrimental to the health of human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth Green*, and contains A. A., oxide of copper, and acetic acid, and is a double arsenite and acetate of copper.

Arsenic (Arsenious Acid), *Properties of, as a Drug*.—A. has long been used as a medicine. When taken into the stomach, it is soon absorbed into the blood, and circulates with that fluid, exhibiting great power over certain diseases, especially skin diseases, as psoriasis, lepra, eczema (q. v.), &c. It is also classed among the tonic minerals, and given for nervous disorders, especially those that are periodic. Of late it has been much recommended for rheumatism; and Dr Begbie, of Edinburgh, considers that among the remedies for chorea (St Vitus' dance) it holds the foremost place. In ague, also, and remittent fever, as well as in other disorders originating from the same source, A. and quinine are our chief remedies. They are considered to act as alteratives of the blood. The usual method of administering A. is in small doses (from three to five drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in the day. Arsenic is sometimes given combined with iodine and mercury (Donovan's solution).

When given in the doses above mentioned, for eight or ten days, symptoms of poisoning begin to appear; the skin becomes hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in, salivation ensues, and then come nausea, vomiting, diarrhœa, nervous depression, and faintness (Begbie). The quantity necessary to destroy life, of course, varies. Dr Christison records the case of a man who died in six days, after taking thirty grains of the powdered white A.; but a much smaller dose will prove fatal; a girl was killed with two grains and a half of A. contained in two ounces of fly-water. According to Dr Swaine Taylor, a medical witness is justified in stating, that under circumstances favourable for its operation the fatal dose for an adult is from *two* to *three grains*. Death from a poisonous dose of A. may occur in a few hours, or after the lapse of days. A woman, aged 56, used a solution of A. in water to cure the itch; she experienced severe suffering, and died after two years, having had symptoms of arsenical poiso time.

A. has been used frequently as a slow symptoms being attributed to inflamm bowels from natural causes. Fortunat cases its detection is easy. Orfila f the soil of cemeteries, a fact which has discussion among toxicologists. if any person shall maliciously set
ftation or other building belonging to
any railway, dock, canal, or other navigation, he is guilty of felony; and he is liable to penal servitude for life, or any term not less than three years; or to be imprisoned, with or without hard labour, for any term not exceeding two years; and if any person maliciously set fire to any *goods* or *chattels* being in any building, the setting fire to which is made felony by act of parliament, he is guilty of felony; and he is liable to penal servitude for any term not exceeding 14 years, nor less than three years, or to be imprisoned, with or without hard labour, for any term not exceeding two years.

Servants convicted of negligently setting fire to houses and buildings, shall, by 14 Geo. III. c. 78, s. 84, forfeit £100, to be distributed among the sufferers, by the churchwardens, in such proportions as to such churchwardens shall seem just; and in case of default, shall be committed to jail or the house of correction for eighteen months, to be kept to hard labour.

It has been laid down in Scotland, that if the fire has been wilfully kindled, it matters not how circuitous may have been the mode of operation selected, although the injury intended to have been done was not the actual burning of the house, but some inferior mischief. And it is the law of both countries, that if the proprietor of a house set fire to it while in possession of a tenant holding under a lease, the crime of A. is completed; and in Scotland, the same has been ruled where the house was occupied by a party having a life-interest in it.

By the 29 Geo. III. c. 46, an act which applies to Scotland as well as England, it is enacted, that if any person shall maliciously and unlawfully set fire to, or in any wise destroy, any ship or vessel, whether the same be complete or in an unfinished state, or shall maliciously and unlawfully set fire to, cast away, or in anywise destroy any ship or vessel, with intent thereby to prejudice any owner or part owner of such ship or vessel, or of any goods on board the same, or any person that hath underwritten, or shall underwrite any policy of insurance upon such ship or vessel, or on the freight thereof, or upon any goods on board the same; every such offender shall suffer death as a felon.*

Both in England and Scotland, it is a considerable aggravation of the offence where the burning is to defraud insurers.

ART. The word A. is here meant as designating what is more specifically termed Fine A., being opposed to the useful arts, or the industrial operations for supplying the common necessities of life. Painting and Poetry are fine arts; Agriculture, Navigation, and Medicine are useful arts.

The great end of A. is to give pleasure, but the kind of pleasure is peculiar and circumscribed. There are many of our enjoyments that no artist would ever think of attempting to provide. The gratifications of eating and drinking, of exercise and repose, warmth and coolness, form a class in contrast with the pleasures of music, sculpture, or the drama. It is a matter of some nicety to draw the line between these two regions of our pleasurable susceptibility; indeed, it is not clear that a precise line can be drawn. Certain peculiarities can be assigned as disqualifying circumstances, such that any mode of pleasure labouring under them is debarred from entering into A.; but after we have allowed for these, there will remain a disputed border-land, on which no general criterion will hold.

The various indulgences called sensual are the

* The statute 29 Geo. III. c. 46, has not been repealed, though there are similar enactments in the English Malicious Injuries to Property Act, but omitting the punishment of death.

best examples of contrast to the pleasures of A. In the first place, as our frame is constituted, these bodily functions, while incidentally ministering to our pleasure, are in the main subservient to maintaining our existence, and being in the first instance guided for that special end, they do not necessarily rank among our gratifications as such; in the second place, they are connected with the production of what is repulsive and loathsome, which mars their purity as sources of pleasure; and in the third place, they are essentially confined in their influence to the single individual; for the sociability of the table is an element superadded. Now, a mode of pleasure subject to one or more of these three conditions may belong in an eminent degree to the list of utilities, and constitute an end of industry, but does not come under the class we are now considering. Wealth is disqualified by the third condition, inasmuch as, while in the shape of money, it is confined to some single proprietor. The same may be said of the pleasures of Power and Dignity. Even Affection is too exclusive to come under the artistic head. Anything so restricted in its sphere of action as to constitute individual property, and give occasion to envy and jealousy, is not a pleasure aimed at by the producer of Fine A.; for there do exist objects that can give us delight as their primary end, that have no disagreeable or revolting accompaniments, and whose enjoyment is not restricted to a single mind; all which considerations obviously elevate the rank of such objects in the scale of our enjoyments. The landscape, the glowing sunset, the song of the lark, the flowers of the field and the garden, yield unalloyed pleasure, and create no monopoly. The painter, sculptor, and musician aim at corresponding effects.

The eye and the ear are the chief avenues of artistic delight; the other senses are more or less in the monopolist interest. Moreover, one important feature in the somewhat capricious attribute termed *refinement*, attaches more particularly to the objects of these two senses; namely, the power of protracted enjoyment without fatigue. A *coarse* effect is one that is intense and pungent, but too exhausting to be kept up; such is a noisy clash of loud instruments in a musical performance, or a tale of overdone marvels. To remove all the fatiguing accompaniments, and thereby tone down the exciting influence, while retaining as much as possible the really pleasurable part, is to refine upon the effect, and produce a higher work of art. Now, in the sensations of taste and smell generally, the stimulus is apt to be of short duration; the pleasure is said to pall soon. Yet there are degrees in the case; some of the choicer odours can affect us for hours together with a gentle and pleasing sensation. But it is the ear, and perhaps still more the eye, that can remain open to agreeable stimulation for the greatest length of time; and taking this fact along with the unconsuming nature of their objects, we see good reasons for the artist striving so earnestly towards the gratification of those two senses.

The sensual elements can be brought into A. by being contemplated in the *idea*, in place of being enjoyed in the reality. A painter or poet may depict a feast to our minds, and impart a pleasure that differs essentially from the delights of eating and drinking. The imagined repast has nothing to do with our bodily necessities; the disagreeable accompaniments can be kept out of view; and any number of persons may share in the effect. So with the elements of wealth, power, dignity, and affection, which in their actuality want the liberal character of the true artistic delight; if we can only derive pleasure from the spectacle of them in the hands of the select number of their possessors, they become to us an enjoyment that can be shared by the general multitude, like the blue sky, or the towering peak. It is the fact that mankind find a charm in contemplating the wealthy, the powerful, the elevated, the illustrious, the beloved; and accordingly such elements are freely adopted into artistic compositions.

If all the sensual gratifications could become artistic by being contemplated in idea, or merely thought of, as in the above case of imagining a rich feast, we should have the means of distinctly circumscribing the select region of the beautiful or artistic, and of resolving a difficult problem. It would be admissible for the poet or painter to suggest any of these inferior pleasures to the mind by descriptive touches, and he would thereby elevate them into the region of art. But we find that every mode of sensual gratification is not open to this ideal presentation. Even as regards eating and drinking, exception is taken against the too free allusion to those pleasures; while the sensuality of love is hardly to be suggested through the most distant allusion. We may revel in tales of mere tender emotion—of parental love and of pure affection—but those other subjects are kept at the utmost distance; and we should be said to be revelling in sensuality, if we were merely to indulge in the imagination of those species of delight. There is no help, therefore, but to consider that there are *conventional* and arbitrary limitations of the sphere of the artist, rendering it quite impossible to draw any clear and universal boundary-line between the beautiful and the agreeable generally.

Sublimity, Beauty, Grace, Harmony, Melody, Pathos, Ideality, Picturesqueness, Proportion, Order, Fitness, Keeping, and the Ludicrous—though they do not all relate to the so-called *beautiful*, are all involved in the circle of pleasures now before us; and it is quite obvious that no one fact can run through this variety of designations. There must be a great multitude of agents operating to produce these different impressions, which are related to one another only by attaching in common to the esthetic class of compositions. Doubtless, several of these names may be employed to mean the same thing, being, in fact, partially synonymous terms; as Beauty and Grace—Proportion, Fitness, and Keeping; but hardly any two terms are synonymous throughout, and there are distinct conceptions implied in Sublimity, Beauty, Picturesqueness, Fitness, and the Ludicrous.

Among the elementary sensations and emotions of the human mind that are of a pleasurable kind, a certain number may enter at once into the composition of A.; such are the pleasures of sound and sight, the emotion of surprise, and plot-interest. Others may enter by ideal presentation; as the gratifications of the remaining senses, and the emotions of fear, tenderness, irascibility, power. The feelings more specific to A. are those produced by Harmony under its various aspects. When several sounds are harmoniously combined, we have the musical art; the painter has a similar aim in reference to colours and forms; and so through all the Fine Arts, this quality is found recurring as the crowning work of the artistic hand. Nothing is so indisputably included within the circle of the esthetical or beautiful as finely struck harmonies, melodies, or concords. Whatever else may be included in a composition, it is the admission of these that gives the specific charm, although it would be a mistake to dispense with other elements of interest common to art and to every-day life. Story is essential to Romance and Poetry; sweetness in the separate sounds is requisite for good Music; and colour in itself imparts aesthetic pleasure apart from harmonious union.

The agreeable effect designated by Fitness takes

the artistic pleasures; we may call it the
f the useful. When a work is not only
tually, but done with the appearance of
s total absence of restraint, difficulty, and
erience a delight quite different from
on growing out of the end attained.
pleasure of architectural support is

ler the rule of fidelity to this extent,
misrepresentation is apt to give a
ck, and mar the pleasure that would
be derived from the poetry itself. It is
ch that truth is a part of the artistic
e that falsehood is a stumbling-block in
or even the imitative arts are only so in
re is no imitation in the metre and
a song, and yet these often constitute the
m. So a certain licence of fantastic
allowed to poets, subject to no rules but
the giving of pleasure. The creation of imaginary worlds, when avowed, is not objected to; and the criterion of fidelity to the actual is accordingly laid aside for the time. The various arts of Decoration and Design are for the most part effusive, although occasionally imitative. Architecture is not in any way imitative; the coincidence between the Gothic roof and the interminglings foliage of a double row of trees, is a mere accident.

These observations are necessary in order to qualify the current maxim, that Nature is the artist's standard, and Truth his chief end; conditions that, in their strictness, apply only to science. It is the scientific man that should never deviate from nature, and should care for truth above every other consideration. The artist's standard is *feeling*, his end is refined pleasure; he may go to nature, but it is to select what chimes in with his feelings of artistic effect, and pass by the rest. He is not bound to adhere to nature even in her choicest displays; his own taste being the touchstone, he alters the originals at his will. The student of science, on the other hand, must embrace every fact with open arms. If a nauseous fungus or loathsome rat meet the eye of a naturalist, he is bound to record it as faithfully and minutely as he would dilate on the violet or the nightingale. When a painter adopts the human figure as a basis for setting forth harmonies of colour, beauties, and form, and picturesqueness of grouping, he ought not to jar our sense of consistency by a wide departure from the usual proportions of humanity. Still, we do not look for anatomical exactness; we know that the studies of an artist do not imply the knowledge of a professor of anatomy; but we expect the main features of the reality to be adhered to. In like manner, a poet is not great because he exhibits human nature with literal fidelity; to do that makes the reputation of a historian or mental philosopher. The poet works by his metres, his cadences, his touching similes, his graceful narrative, and his exaltation of reality into the region of ideality; and if in all this he avoids serious mistakes and gross exaggerations, he succeeds in his real vocation.

The attempt to reconcile the artistic with the true—art with nature—has given birth to a peculiar school, in whose productions a restraint is put upon the flights of pure imagination, and which claims the merit of informing the mind as to the realities of the world, while gratifying the various emotions of taste. Instead of the tales of Fairyland, the Arabian Nights, and the Romances of Chivalry, we have the modern novelist, with his pictures of living men and manners. In painting, we have natural scenery, buildings, men, and animals represented with scrupulous exactness. The sculptor and the painter exercise the vocation of producing portraits that shall hand down to future ages the precise lineaments of the men and women of their generation; hence, the study of nature has become an element in artistic education; and the artist often speaks as if the exhibition of truth were his leading purpose. It is probably this endeavour to subject the imagination more strictly to the conditions of truth and reality, that has caused the singular inversion whereby the definition of science is made the definition of art.

But while fidelity, in the imitative class of arts, is to be looked upon, in the first instance, as avoiding a stumbling-block rather than constituting a charm, there are still certain ways wherein we derive from it a sort of pleasure that may be called æsthetic. We feel drawn by fellow-feeling towards one who has attended to the same objects as ourselves, or who has seized and put into vivid prominence what

we have felt, without ever having expressed. The coincidence of mind with mind is always productive of the agreeable effect of mutual sympathy, and, in some circumstances, there is an additional effect of pleasing surprise. Thus, when an artist not merely produces in his picture those features of the original that strike every one, but includes all the minuter objects that escape the notice of the generality, we sympathise with his attention, we admire his powers of observation, and become, as it were, his pupils, in extending our study and knowledge of nature and life. We feel a pungent surprise at discovering, for the first time, what has been long before our eyes; and so the minute school of artists labour at this species of effects. Moreover, we are brought forward as judges of the execution of a distinct purpose; we have to see whether he that is bent on imitation does his work well or ill; and if our verdict is favourable, our admiration is excited accordingly. There is, too, a certain exciting effect in the reproduction of some appearance in a foreign material, as when a plain surface is made to yield the impression of solid effect, and canvas or stone imitates living humanity. Finally, the sentiment of reality and truth, as opposed to fiction or falsehood, appealing to our practical urgencies, disposes us to assign a value to every work in which truth is strongly aimed at, and to derive an additional satisfaction when fidelity of rendering is induced upon the charms peculiar to A. Thus imitation—which, properly speaking, is a mere accident attaching to Sculpture, Painting, and Poetry, and has no place in Music or Architecture—may become the centre of a small group of agreeable or acceptable effects. These effects are the more prized, that we have been surfeited with the purely æsthetic ideals. We turn refreshed from the middle-age romance to the graphic novel of our own time.

Besides being a source of pleasure, art is frequently spoken of as having an elevating and refining influence on the mind and character; for which reason it is considered a proper object of public encouragement in civilised communities. This circumstance is owing to the higher nature of artistic pleasure as above described, the taste for which helps to rescue mankind from the exclusive dominion of sensual and selfish enjoyments. At the same time, we must admit that the devotion to art may be itself excessive, and have the effect of withdrawing men too much from the urgency of practical life, rendering them a prey to political despotism, as well as indifferent to moral principle. Instances are not wanting to justify this remark.

See Dugald Stewart's *Philosophical Essays*, Part II., and Bain on the *Emotions and the Will*, p. 247.

ART, HISTORY OF. The history of the origin and development, growth and decline of beautiful artistic forms, constitutes a portion of the history of civilisation. As regards each particular people, the history of their efforts to conceive and express absolute perfection, or what is commonly called ideal beauty, in form and colour, is, with the single exception of the history of their speculative opinions, the most reliable test of the stage of progress which they have attained. Nor is it as an indication of their command over physical nature, of the abundance of their external resources, or even of their intellectual activity alone, that the history of the art of a people is thus important. It determines their moral, and even, in a certain sense, their religious position, for the inseparable connection between the beautiful and the good is in no way more clearly manifested than in the fact, that the first inroads of demoralisation and social disorder are invariably indicated by a diminution in the strength and purity of artistic forms. It has been usual to include under the term history of art merely the history of the arts of form, including architecture, but excluding, of course, poetry and music, though these latter, again, are generally included when we speak of the fine arts. See ART.

The classical nations of antiquity were not insensible to the importance of tracing the development of that rich artistical life which they had originated, and we accordingly find the germs of artistic history in Pliny, Quintilian, Pausanias, and others. In the middle ages, every trace of a general historical treatment of art disappears, though casual remarks and incidental notices on the subject of artists and the arts are abundant, particularly in such works as the *Liber Pontificalis* of Abbot Anastasius (q.v.), who is commonly known as 'the Librarian,' in consequence of his having filled that office at the Vatican in the 9th c. But a history of art, in the sense which we have here assigned to the term, made its appearance in the world for the first time on the revival of letters, in the 15th and 16th centuries; when the artistic treasures of the heathen world, which had come upon mankind as novelties, fell to be contrasted with that peculiar type which art had assumed under Christian influences during the middle ages, on the one hand (see BYZANTINE ART), and on the other with that rich harvest of fresh invention which ripened during the long lives of Leonardo da Vinci (q. v.) and Michael Angelo (q. v.), in the period of which Raphael's (q. v.) short career may be regarded as the noon-day. Whilst Vasari (q. v.) traced the great epochs of Italian art, from a biographical point of view only it is true, in his celebrated work; the students of classical literature collected such expressions of opinion on artistic subjects as the writings of the ancients contained, and Palladio, Ligorio, Vignola, and others measured ancient buildings and their constituent members. In this way a vast mass of information on artistic subjects was brought together. But though the materials which might have served for a history of art were thus supplied, it was a long time afterwards before anything like proper historical treatment arose; and the knowledge of ancient art which had been gained, was applied to their respective purposes by artists on the one hand and philologists on the other. As regarded modern art, the biographical method of Vasari was adhered to, and to this circumstance we are indebted for the innumerable artistic anecdotes which have been preserved. The remarkable variations in style which exhibited themselves between the 16th and 18th centuries, gave rise to a species of historical treatment which had for its object the discovery of the common features by which the artists of the respective periods were distinguished. But the history of style, strictly speaking, begins with Winckelmann (q. v.), who was the first to divide ancient art into epochs and to trace its connection with the general history of human progress. It was from this period that the history of art came to be regarded as a branch of the history of civilisation. Even where the biographical method continued to be followed, it was henceforth with this difference that the division into schools took the place of mere chronological arrangement. The strongly classical tendency which exhibited itself towards the end of last century, and the romantic reaction and consequent admiration for the middle age which succeeded, though both must be regarded as one-sided influences, had an unquestionable effect in calling attention to what was really great in the artistic productions of their respective periods; and during the present century, the history of art has gradually assumed a more important place as a department of general history. It was only in very recent times, however, that a complete artistic history appeared in Kugler's *Handbook of the History of Art*, which has been partially

…d into English, and edited by Sir Charles East-
… original work, which is very excellent, the

…ne on, not only without interruption, but
…easing energy. The number of works
… in 1760 was only 130, the number of
… being 69; in that of 1859 there were
… by 918 artists. The annual revenue
…Academy derives from the fee of one
… by each visitor has also been steadily
increasing. The exhibition of the Scottish Academy, which is the second in importance in this country, has existed since 1826. To the first exhibition, 178 works were sent by 27 contributors; the exhibition of 1873 consisted of 1144 works, which were contributed by 462 artists. The annual revenue of the Scottish Academy derived from this source exceeds £2500. The only other exhibition of the same class in the United Kingdom is that of Dublin, which is supported by an annual grant from government – the exhibitions of London and Edinburgh being merely furnished with rooms erected at government expense. Several private societies in London and the provinces, however, have exhibitions for similar objects, and conducted on similar principles. Of these we may mention the British Institution, the Society of British Artists, the National Institution, the Society of Painters in Water-colours, and its rival, the New Society of Painters in Water-colours. There are also exhibitions in several of the large provincial towns, such as Manchester, Liverpool, Glasgow, &c. On the continent, wherever an academy of art exists, there is now an exhibition, which takes place for the most part annually, but sometimes biennially. In New York there is a permanent exhibition of the works of Düsseldorf artists; and from thence they are frequently carried for exhibition to the provincial towns of the Union.

The London Exhibition of 1851, commonly known as the *Great Exhibition*, was not only on a larger scale, but introduced new features into these displays. Though confined to industrial objects and works of plastic art, it gave an impulse to A. E. strictly so called, which shewed itself almost simultaneously in the great international artistic exhibition of Brussels; and even those exhibitions which have been formed more closely on its model – those of Dublin in 1853, and of New York in the same year, of London in 1862, Paris 1867, and Vienna 1873 – have all included the fine arts. See EXHIBITIONS.

ART UNIONS. These institutions, which have for their object the promotion of a livelier interest in, and more liberal patronage of, the fine arts on the part of the general public, have gone far in modern times to supply the place of that encouragement which, at an earlier period, they received from princes and prelates.

The origin of A. U., though claimed by the Germans, seems really to belong to the French, and to be traceable to the stirring days of the first Napoleon. From France they passed over into Belgium, where they at once took root, and established themselves even in the less important towns, ten years before they were introduced into Germany. The Art Union of Malines dates from 1812, which is eleven years anterior to that of Munich. But it was in Germany that the importance of the results which A. U. were capable of producing first became apparent, and it was from Germany that they were carried into England. The Art Union (*Kunstverein*) of Munich was established in 1823, and became the model of most of those which afterwards arose. The example of Munich was speedily followed (at the suggestion, we believe, of no less distinguished a personage than Alexander von Humboldt) by Berlin, and shortly thereafter by Dresden, Leipsic, Breslau, Halberstadt, &c.; and in less than ten years there were few of the larger towns of Germany in which A. U. were not to be found. But the most important of all the A. U. of Germany is that which was established at Düsseldorf in 1829, for the Rhine provinces and Westphalia. The Düsseldorf Association has aimed at higher objects than A. U. have usually had in view, either in Germany or in England, and has been instrumental in promoting the execution of monumental works of art of the highest

class. In the space of twenty years from its institution (1849), it had expended on works of art what in Germany was regarded as the enormous sum of 268,000 thalers, equivalent to about £40,200 sterling; and had been the means of placing 24 altar-pieces in churches, eleven paintings on a large scale in public buildings, of which the frescoes in the council chambers at Elberfeld and at Aix-la-Chapelle may be mentioned as examples. The Association of Düsseldorf also publishes an artistic periodical (*Correspondenzblatt*). Other associations have imitated, not without success, the Association of Düsseldorf in directing their attention to the promotion of great works. The Bohemian Association at Prague has been peculiarly meritorious in this respect; and those of Berlin and of Cologne deserve the highest commendation for the zeal with which the first promoted the erection of Kiss's magnificent group of the Amazon on the steps of the Museum at Berlin, and the second urged on the completion of what already, in its half-finished condition, is one of the greatest architectural monuments of Northern Europe—the cathedral of Cologne. The establishment of permanent galleries of art in the cities to which they respectively belong, is also regarded in Germany as one of the higher objects of A. U.; and in this they have been recently followed in this country, as, for example, in Edinburgh. In Munich there is already a very noble collection of modern works of art, which have been brought together in this manner; and another of the same description is in course of formation in Berlin. Association galleries also exist in Dresden, Leipsic, Breslau, Stettin, &c. Groups of associations have also been formed in Germany for the promotion and encouragement of extensive works. The western group, or cycle, as it is called, includes Hanover, Halberstadt, Magdeburg, Halle, Gotha, Brunswick, and Cassel; the eastern, Danzig, Königsburg, Stettin, &c. This arrangement, by which the influence of these associations on the highest class of art must be vastly augmented, seems worthy of imitation in this country.

Scotland, as is not unusual where the suggestion comes from a continental source, preceded England in the establishment of A. U.; the first that was formed in Britain being that of Edinburgh in 1834. The cause of its introduction was not so much the hope of bettering the condition, as the necessity of preventing the utter extinction of everything beyond mere imitative art. Portrait-painting continued to furnish the means of living to those who practised it with success; and those who represented familiar occupations or popular customs, obtained a more limited encouragement; but it was found that precisely as the artist rose in the scale of artistic endeavour, and tended in the direction of ideal art, the sympathy and interest of his countrymen, and consequently his own remuneration, declined. The Royal Academy of London, and the academies which had been formed after the same model in Edinburgh and in Dublin, notwithstanding the annual exhibitions which they had instituted, had entirely failed to remove this evil. Private purchasers were not to be found; and in Edinburgh it was calculated that never more than £300, and sometimes as little as £35, were expended in the purchase of pictures exhibited by the Academy, and even these insignificant sums were usually paid for pictures of the very lowest class. Elsewhere, matters were even worse. Mr Cash, a witness examined before the select committee of the House of Commons on A. U. in 1845, stated that previous to the establishment of the art union in Dublin, 'in four years, during the exhibition of the works of the Royal Hibernian Academy, 30*s.* only were expended on the patronage of art.' 'Thirty shillings annually?' asked the chairman. 'No,' replied the witness; 'thirty shillings was the entire sum expended in the four years.' The success of the Scottish Association was immediate; and to its founders the public are in no small degree indebted for the rapid progress which art has made in this country during the last twenty years. 'A large annual fund,' says the secretary, in his statement to the above-mentioned committee, 'exclusively devoted to the purchase of paintings and sculpture, and to the dissemination of engravings, was speedily realised, which in the course of nine years amounted to not less than £36,900. During the same period, 771 paintings, 40 pieces of sculpture, and about 30,000 impressions from engraved plates, were distributed among the members of the Association.' Since this period, the annual funds of the Edinburgh Association have continued steadily to increase; and its promoters, as the results of their disinterested labours, have had the satisfaction to see a school of art spring up around them which is probably second to those of Munich and Düsseldorf alone. Our limits preclude us from entering into the history of the other societies in Britain which have been formed after the model of the parent institution of Edinburgh; but some conception of the success which has attended them may be gathered from the fact, that in 1855 it was calculated that they had expended not less than the enormous sum of a million sterling on the encouragement of art. In addition to this direct expenditure, what is a very remarkable, and was to most persons probably an unexpected result, was, that the patronage of private individuals, in place of diminishing, greatly increased, both in Edinburgh and London, during the period in question. Before concluding our sketch of the rise of these very remarkable institutions, it is proper to mention the art union of New York, established in 1838, which now supports two galleries with works of art in that city, and the members of which have had the wisdom to establish an intimate relation and lively interchange of works between their own institution and that of Düsseldorf.

As regards the constitution of A. U., the following arrangements may be stated to be common to them all. Each member, in return for an annual contribution (in Britain, usually a guinea), receives an acknowledgment, which acts as his ticket in the lottery by which the works of art, purchased with the sum thus contributed, are distributed amongst the members. Generally, a fixed proportion of the contributions is retained and devoted to the preparation of an engraving, which is presented to those who have drawn blanks in the lottery. The engraving is usually executed by a local engraver, after a work of the local artist intended to be patronised. The association further makes provision for an exhibition, either permanent, as at Munich, or annual, as in London and Edinburgh, consisting mainly of the works of local artists, though most associations now admit those of strangers. A diversity of practice has existed as to the mode of distributing the funds of the union, and much controversy has taken place between their respective partisans. The first, common on the continent, and adopted in Edinburgh, consists in putting the whole sum collected for each year into the hands of a committee of gentlemen, who are chosen for their supposed æsthetic acquirements and impartiality, and requesting them to select the pictures and other works of art afterwards to be distributed to the subscribers by lot; the second is the London plan of distributing the money itself by lot, and then permitting, or rather compelling, the prize-holders to expend it on the pictures exhibited, the selection of the pictures, however, being left to their own taste

If the object of these institutions be

power.—A. II., surnamed *Mnemon*,
succeeded his father, Darius II., in 405 B.C. After gaining the victory over his brother Cyrus, he became involved in war with Sparta, which ended with the Antalcidean Treaty of Peace. He died in 361.—A. III., surnamed *Ochus*, was the son and successor of the former, and reigned in the true style of oriental despotism until 338 B.C. One of his most daring exploits took place in Egypt, where he caused the divine bull Apis to be slaughtered and cooked as ordinary beef. A. III. was poisoned in 338 by his eunuch Bagoas. It is said that his flesh was eaten by cats, and that hilts for scimitars were made of his bones.—The founder of the new Persian dynasty of the Sassanidæ (which ruled from A.D. 226 to 651) was named A.

ARTEDI, PETER, a celebrated naturalist, was born on the 22d of February 1705, at Anund, in the province of Angermannland, Sweden. He was at first designed for the church, and entered the university of Upsala, intending to pursue the usual course of philosophy and theology; but he soon abandoned all thought of the ministry, and betook himself to medicine. In 1728, Linnæus went to Upsala, to study the same science, and a close intimacy sprung up between the young men. They worked together, and to a certain extent, on the principle of a division of labour. Physiology, chemistry, and mineralogy they pursued in common; but to this A. added ichthyology, and Linnæus ornithology and entomology. In 1734, A. sailed for England, and Linnæus went to Lapland, each having made the other his heir and executor of all his scientific documents. While in London, A. wrote the preface to his *Ichthyologia*. Next year he went to Leyden in Holland, where he found Linnæus just arrived from the north. Each shewed the other the results of his labours. A.'s useful career was abruptly ended, on the 21st of September 1735, by his falling into one of the canals near Amsterdam.

A.'s only complete work is the *Philosophia Ichthyologica*. The *Synonymologica* is described as a work of extraordinary labour, but somewhat confused. Linnæus faithfully performed his duty as his friend's executor. He arranged, corrected, and completed his manuscripts, and published the whole, together with a life of the author, in 1738. According to Cuvier, the great work of A. is the first named, which gave a truly scientific character to the study of fishes. The only error of any magnitude which occurs in it is including the Cetaceæ among fishes. A. was also a distinguished botanist. He was the first to indicate, as a special characteristic, the presence or absence of involucra in the umbelliferous plants, whose species are so difficult to distinguish from each other. Linnæus has called a genus of these, in memory of his friend, *Artedia*.

ARTEMISIA, queen of Caria (352—350 B.C.), was the wife of Mausolus, and is celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory. See MAUSOLEUM.—Another A., queen of Halicarnassus, accompanied Xerxes in his expedition against Greece, and distinguished herself at the battle of Salamis (480 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

ARTEMISIA, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, in which the flowers of the disk are hermaphrodite, those of the ray in one row, the bracts forming a roundish imbricated head, the receptacle naked or hairy, the achænia obovate, and destitute of pappus. The heads of flowers are numerous and small; the leaves generally much divided. There are many species, herbaceous plants and shrubs, natives chiefly of the

more temperate regions of the eastern hemisphere. They have generally an aromatic smell, more or less agreeable, and a warm, sometimes rather acrid and bitterish taste.—To this genus belongs WORMWOOD (*A. Absinthium*), the *Apsinthion* of the ancient Greeks, to whom its medicinal properties were well known. It is a native of Britain, the continent of Europe, and the northern parts of Asia, growing in waste places, by waysides, &c. It is a perennial, 2—4 feet high; its leaves bipinnatifid and clothed with a silky down, and its small hemispherical drooping heads of flowers are of a dingy yellow colour, and are produced in axillary panicles. It is aromatic and bitter, containing a bitter principle and an essential oil, both of great strength, upon account of which it is used in medicine in various forms (oil, extract, tincture, &c.), as a stomachic and anthelmintic or vermifuge. It was formerly in much use as a febrifuge. It is a plant very frequently to be found in cottagers' gardens, occupying an important place in their domestic pharmacopœia. It is an essential ingredient in a number of compound medicines. Its roots, and those of some other species of this genus, have been recommended in epilepsy.—SEA WORMWOOD (*A. maritima*, including a variety which has been called *A. Gallica*), a native of salt-marshes in Britain and other parts of Europe, possesses similar properties, and is occasionally used for the same purposes; as also ROMAN WORMWOOD (*A. Pontica*), a native of the middle and south of Europe, but not of Britain—TARTARIAN WORMWOOD (*A. Santonica*), a native of Tatary, Persia, and other parts of the East; and INDIAN WORMWOOD (*A. Indica*), a native of the Himalaya, abounding at

Wormwood (*Artemisia Absinthium*).

elevations of 2000 6000 feet. Indian wormwood grows to the height of 12 feet. It is considered in India a powerful deobstruent and antispasmodic. TREE WORMWOOD (*A. arborescens*), a native of the south of Europe and the Levant, is also larger and more shrubby than the common wormwood, which, in characters and qualities, it much resembles.—The dried flower-buds of a number of species of A. are sold under the names of WORMSEED and of *Semen Contra*, *Semen Cinæ*, *Semencine*, &c., and have long been in much repute as an anthelmintic. *A. Santonica*, and *A. Sieberi* (or *A. Contra*), a native of Palestine, are believed to yield much of the wormseed which is brought from the Levant, also *A. Judaica*, a native of the East and of Barbary, which is regarded as the principal source of the Barbary wormseed. The flower-buds of *A. glomerata*, *A. Lerchiana*, and *A. pauciflora*, natives of the banks of the Volga, are also said to form part of the wormseed of the shops; and those of *A. Vahliana* are collected in the north-east of Persia, and form the *Semen Cinæ Levanticum* or *Semen Cinæ in granis*. The flower-buds of *A. cærulescens*, a Mediterranean plant, which is said to have been found on the sea-coast of England, form the anthelmintic called *Semen Seriphii* or *Barbotine*. Those of *A. camphorata*, another native of the south of Europe, are used in the same way. Even those of *A. Absinthium* and *A. vulgaris* are used under the name of wormseed.—The plants from which the bitter aromatic liquor called *Extrait*, *Eau*, or *Crême d'absinthe* is prepared, are small low-growing species of A. (*A. mutellina*, *A. glacialis*, *A. rupestris*, *A. spicata*, &c.), found on the Alps, and known to the inhabitants of the Alps by the name of *Genipi*. This liqueur, generally diluted with water, is sometimes used by persons so devoted to the pleasures of the table that they cannot wait for the natural return of appetite, and also by those who really suffer from weakness of digestion. It is a useful and agreeable stomachic, and is very popular in France.—MUGWORT (*A. vulgaris*), a common native of Britain and of the continent of Europe, often found about ruins and in waste places, grows to the height of 3—4 feet, with pinnatifid leaves and somewhat racemed small flowers, which have each five florets of the ray. It emits, when rubbed, an agreeable smell, and has a bitter taste. In Germany, the young shoots and leaves are used in cookery for seasoning. It is used also for the same medicinal purposes as wormwood, but is weaker. Its leaves, and those of some of the other species, are used as fomentations for cleansing and healing wounds.—SOUTHERNWOOD (*A. Abrotanum*) is a shrubby plant with long straight stems, 3—4 feet high, the lower leaves bipinnate, upper leaves pinnate, their segments hair-like. It is a native of the south of Europe and middle parts of Asia, and has long been a favourite plant in cottage-gardens in Britain. It has an aromatic and pleasant odour. The leaves are used to drive away moths from linen; and in some parts of the continent of Europe, as an ingredient in the manufacture of beer. The smell of this plant appears to be peculiarly disagreeable to bees, which retreat from it; and a little branch of southernwood is sometimes efficaciously used when they are swarming, to promote their ascent into the new hive placed over them.—TARRAGON (*A. Dracunculus*) is a perennial plant, a native of Siberia, which has also long been cultivated in gardens in Britain. It has a branching stem 1 - 1½ feet high, with narrow leaves. It is fragrant, and has an aromatic smell and taste. The leaves and tender tips are a favourite ingredient in pickles. An infusion of the plant in vinegar is used as a fish-sauce.—The leaves of *A. Maderaspatana* are regarded in India as a valuable stomachic, and are also used in anodyne fomentations.—MOXA (q. v.) is prepared by the Chinese from the leaves of *A. Moxa* and other species, the whole surface of whose leaves is covered with a thick down.—*A. acetica*, a Persian species is said to have a strong odour of vinegar.

ARTERY (Lat. *aer* and *terō*), named from the old idea that these tubes were air-carriers. Arteries are the vessels through which the blood passes from the left side of the heart to the tissues. The structure

tube is very complex, and a section of y subdivided into three layers, called artery: an external, which is elastic

bdivisions of Arterial Wall.

al, } internal. 3. Muscular, } middle.
ated, } 4. Elastic, }
5. Fibrous, } external.
6. Areolar, }

ble; a middle, which is muscular, con- brittle; an internal, also brittle, smooth, ent, being lined with epithelium on the by the blood. The tube is also enveloped ane, termed the *sheath* of the A. When aded by a sharp instrument, the effect the direction of the cut. Thus, if the edges may not separate, and the h without much bleeding; if oblique e edges gape, and a nearly circular of a profuse hemorrhage. If the A. be livided, its walls do not collapse like ein, but pass through certain changes nature to prevent fatal bleeding. The ntracts, and also retracts into its cellular checks the flow of blood, a clot rtly forms on the outer side; then inside the vessel; and together, they , till the cut edges of the A. have w out lymph (see ADHESION), and heal of other tissues. When an A. is com- ligature, the brittle inner and middle curl inwards, and heal. See BLEEDING. es of the human body are all offsets, irect, of the aorta. As each main trunk a portion of the body, it divides into l divisions: one, which breaks up into supply of the tissues in the vicinity *supply*; and another, which passes on to supply the parts beyond—the *nsion*. These, however, anastomose , so that the distant tissues are not dent for their supply on only one k. Thus, the femoral A. divides in the e profunda, or *deep* femoral, to supply d the *superficial* femoral, to supply the knee. Again, the common carotid *ternal* carotid, to supply the neck and e *internal* carotid, to supply the brain. eries have generally the same distri- angement of branches, they occasionally hereby are apt to puzzle a superficial Mr Thomas Nunn of London, an excel- anatomist, has clearly shewn that these arterial distribution are all governed f arterial distribution just mentioned, a ot only simplifies the study of arterial t assists the operative surgeon out of mitons. The principal arteries will be nder their distinctive names. The best authority on arteries is the splendid work of R. Quain.

ARTESIAN WELLS are perpendicular borings into the ground, through which water rises, from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain, in addition to the quantity of dry sand which occupies that space, about one-third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water: such are clays, which are absolutely retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in basins (q. v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds. The explanation will be more evident by a reference to the accompanying figure, which may be considered as a diagrammatic section of the London basin. There is here a number of porous beds, *b*, *b*, composing the cretaceous measures, resting on the impervious gault, *aa*, and these,

Section of the London Basin.

again, are covered by the equally impervious series of the London clay, *cc*, which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the whole area of these exposed edges, sinks into the more or less porous cretaceous beds, and would, in course of time, by continued accessions, fill up the basin, were it not prevented by the clay above. By driving a bore, *d*, through this superior bed, the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.

Many such wells exist in London and its vicinity; those which form the ornamental fountains in Trafalgar Square descend into the upper chalk to a depth of 393 feet. The most famous artesian well perhaps is that of Grenelle, in the outskirts of Paris, where the water is brought from the gault

at a depth of 1798 feet. It yields 516¼ gallons of water in a minute, which is raised with such a force as to be propelled 32 feet above the surface. The pressure required to effect this has been calculated to exceed 50 atmospheres at the bottom of the bore. The water has a constant temperature of 81°·7 F.

It is believed that the Chinese have been long acquainted with artesian wells. They have been in use for centuries in Austria, especially in the neighbourhood of Vienna, where they are very abundant. No knowledge existed as to their source, and consequently the boring for them was engaged in and conducted in a rude and empirical manner. An excavation was made till a bed of clay was reached; on this a perforated mill-stone was laid, and through the hole the clay was bored until water rose. As soon as geology took the position of a science, and the theory of A. W. was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already, districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made: it seems likely that erelong Africa's deserts may thus be converted into fertile plains. In an official report of the Algerian government for 1856—1857, it is stated that artesian borings have been executed in the Sahara of the province of Constantine with remarkable success. The first attempt, after a few weeks' labour, produced a constant stream, forming a perfect river, and yielding 4010 quarts of water per minute, at a temperature of 78° F. Several other wells have been sunk with equal success. The result is likely to be beneficial not only to the country materially, but also to the character and habits of its nomadic Arab inhabitants. Several tribes have already settled down around these wells, and forming thus the centres of settlements, have constructed villages, planted date-palms, and entirely renounced their previous wandering existence.

A. W. have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81°·7 F., while the mean temperature of the air in the cellar of the Paris Observatory is only 53°. MM. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. The latter gentleman has recently made a series of very accurate and careful observations on the temperature of two borings at Creuzot, within a mile of each other, commencing at a height of 1030 feet above the sea, and going down to a depth, the one of 2678 feet, the other about 1900 feet. The results, after every possible caution had been taken to insure correctness, gave a rise of 1° F. for every 55 feet down to a depth of 1800 feet, beyond which the rise was more rapid, being 1° for every 44 feet of descent.

ARTEVELDE, Jacob, a brewer of Ghent, celebrated as a popular leader in the 14th c. In the war between England and France, he gave his aid to the former, while the counts of Flanders supported the latter. A., after gaining great advantages over the party of the nobles, went too far when he proposed that the son of Edward III. of England should be elected Count of Flanders. For this the Flemings were not prepared, and, in consequence, A. was killed in a popular insurrection, August 19, 1345. His son Philip, in l[illegible] people of Ghent in their civ[illegible] and gained a victory over C[illegible] was afterwards assisted by [illegible] and Philip A. was defeated and slain in the b[illegible] Rosbeke, 1382. The history of A. has been several times treated dramatically. In England, Sir Henry Taylor, a living writer of eminence, has produced a beautiful 'closet-play,' entitled *Philip Van Artevelde*.

A'RTHUR, king of a tribe of ancient Britons, is supposed to have flourished in the 6th century. He is usually represented as a Christian prince who struggles bravely to maintain the liberty and faith of his country against the pagan Saxons, but there is no evidence for the statement that he fought against the Saxon Cerdic. Neither the Welsh bards nor Nennius assert this; in fact, it would seem to be merely an inference drawn from the supposition that the scene of A.'s exploits was the west and south-west of England. But Mr Skene (*The Four Ancient Books of Wales*, vol. i., pp. 58–60) seeks to prove from an examination of Nennius (*Historia Britonum*, cap. 50), that the localities of the twelve great battles which A. fought are in Strathclyde, and therefore that he belongs to the region now called Scotland rather than to England. If there is any reality in his history at all, this is probably the correct view of it, but the influence of Geoffrey of Monmouth's fictions, and of the French romances, succeeded in fixing the Cumbrian prince in the more important part of the island. It is a curious fact that no mention whatever is made of A. by the venerable Bede, the oldest of our historians, or by the annalists of the *Saxon Chronicle*; and Mr Skene's explanation, that these authorities only 'record the struggle between the Britons and the Saxons south of the Humber,' is hardly satisfactory.

In the lays of the Welsh bards, supposed to be as early as the 6th and 7th centuries (although no manuscript is extant of older date than the 12th c.), A. and his brave companions are celebrated, but modestly and without miracle. It is in Nennius that the legendary additions begin to develop themselves, though Mr Skene does 'not hesitate to receive the Arthur of Nennius as the historic Arthur.' Then follow at a distance of three or four centuries the so-called Armoric collections of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth (q. v.) professes to translate, and in which the marvellous and supernatural elements largely prevail. Here for the first time the magician Merlin comes into association with A. According to Geoffrey, A.'s father, Uther, conceiving a passion for Igerna, wife of Gorlois, Duke of Cornwall, is changed by Merlin into the likeness of Gorlois, and A. was the result. After his father's death, A. becomes paramount leader of the British, and makes victorious expeditions to Scotland, Ireland, Denmark, Norway, and even to France, where he defeats a great Roman army. During his absence, his nephew, Modred, revolts, and seduces Prince A.'s wife, Guanhumara. A. returning, falls in a battle with his nephew; and is carried to the Isle of Avallon to be cured of his wounds. Geoffrey's work apparently gave birth to a multitude of fictions which came to be considered as quasi-historical traditions. From these, exaggerated by each succeeding age, and recast by each narrator, sprung the famous metrical romances of the 12th and 13th centuries, first in French and afterwards in English, from which modern notions of A. are derived. In these his habitual residence is at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lives in splendid state, surrounded by hundreds of knights and beautiful ladies, who serve as patterns of valour, breeding, and grace to all the

welve knights, the bravest of the throng, centre of this retinue, and sit with the round table, the 'Knights of the Round from the court of King A., knights go ll countries in search of adventures— women, chastise oppressors, liberate the enchain giants and malicious dwarfs, is ttly mission. A Welsh collection of stories *Mabinogion*, of the 14th and 15th cen- translated into English by Lady Charlotte gives an idea of the Arthurian ... of the stories 'have the character romances,' and are therefore probably origin; while others 'bear the impress of r antiquity, both as regards the manners , and the style of language in which they ed.' These latter rarely mention A., but belong, as Mr Skene puts it, to the Arthurian romance.' Early in the Arthurian metrical romance became ermany, and there assumed a more and artistic form in the *Parzival* of Eschenbach, *Tristan and Isolt* of Strasburg, *Erec* and *Iwein* of Hart- *Wigalois* of Wirnt. The most renowned es of the Arthurian school are Peredur Perceval), Tristan or Tristram, Iwein, Wigalois, Wigamur, Gauriel, and m France, the Arthurian romance to Spain, Provence, Italy, and the Nether- was again retransplanted into England. publications that issued from the press (1483), was a collection of stories by Sir alory, either compiled by him in English, as of the later French prose romances, or directly from an already existing French Copland reprinted the work in 1557, the last of the black-letter editions A reprint of Caxton's *Kynge Arthur*, duction and notes, by Robert Southey, a 1817 (*The Byrth, Lyfe, and Actes of r*, &c., 2 vols. 4to). The best edition is mas Wright (Lond. 3 vols., 1866) from 1634. The name of King A. was given middle ages to many places and monu- posed to have been in some way asso- his exploits, such as 'Arthur's Seat' burgh, 'Arthur's Oven' on the Carron rk, &c. What was called the sepulchre e was shewn at Meigle, in Strathmore, e. The interest of the legends about his knights has been revived by the Tennyson's *Idylls of the King* (1859 e Turner's *History of the Anglo-Saxons*, Ritson's *King Arthur*; De la Villemar- *Populaires des Anciens Bretons* (2 vols., ; Grasse, *Die Grosse Sagenkreise des* Leip. 1842); Skene's *Four Ancient ks* (Edin. 1868); Glennie's *Arthurian*

SEAT, a hill in the immediate burgh, which rises to the height of ove the level of the sea. The ascent is he prospect from the top unrivalled. supposed to derive its name from the g of that name. When the hill received ation is not known; but as early as the he 15th c., Kennedy, the Scotch poet, Arthur Sate or ony hicher hill.'

is formed of a mass of trap of various heaved through the carboniferous strata Scotland, and presenting on the west sides, at the height of 570 feet, a perpen- ge of precipices, called Salisbury Crags, et high. The trap is in tabular masses, levated and hardened the carboniferous sandstone, shale, and limestone beds, which dip east, and crop out on the west, besides being broken through and overflowed by the trap-rocks. In the centre of the hill, the trap often encloses fragments of sandstone, and divides it by veins. The central and upper part of the hill, and the remarkable columns called 'Samson's Ribs,' consist of basalt. To determine the density of the earth, a series of observations was made in 1855 by Lieutenant-colonel James of the Ordnance Survey, on the attraction of A. S., or the amount of deviation from the vertical caused by its mass on the plumb-line. Calculation made the mean density of the whole earth 5·316 (water being 1), or about twice the mean specific gravity of the rocks forming the hill, which experiment gave as 2·710.

ARTICHOKE (*Cynara Scolymus*), a thistle-like perennial plant, now growing wild in the south of Europe, but probably a native of Asia. The genus *Cynara* belongs to the natural order *Compositæ*, sub-order *Cynarocephalæ*, and is distinguished by the bracts of the involucre being fleshy at the base, and emarginate, with a hard point, and the receptacle fringed. *C. Scolymus* has the radical leaves 3—4 feet

Artichoke.
(Head of flowers.)

long, somewhat spiny, some of them pinnatifid, some undivided. The stem is two or three feet high, branched, with large heads of violet-coloured (sometimes white) thistle-like flowers at the summits of the branches. The involucre is tumid, and consists of fleshy, roundish-ovate, crenate, acuminate, imbricated scales. The seeds are elongated and quadrangular, with smooth and firmly attached pappus. The plant has been long cultivated for the sake of the delicate succulent *receptacles* of the heads of flowers, taken before the flowers expand, which are boiled and eaten, or, on the continent of Europe, eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used in the same way as that of the Cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about four feet asunder, and two feet apart in the row. The A. bed continues productive for several years. Seaweed is an excellent manure.—The CARDOON (q. v.) belongs to the same genus.—The JERUSALEM A. (q. v.) is a totally different plant.

ARTICLE (Lat. *articulus*, a joint) signifies in

general a part of a systematic whole. Thus, we speak of the several articles of a confession; the articles of war; a leading article, &c.

The use of A. as a grammatical term arose as follows. In such a sentence as, 'He found *that* (or *the*) man *that* he was looking for,' the Greeks considered the defining particles as connecting the two parts of the sentence, and called them joints (Gr. *arthra*, Lat. *articuli*); the name was subsequently confined to the first of the two, the other being called the relative.

In English, there are two articles—the definite *the*, and the indefinite *a* or *an;* and other modern languages have corresponding words. But articles are not essential to language. The Latin had no articles, and the Greek, as well as the older Germanic languages, the Mœso-Gothic and Old Norse, e.g., had only the definite A. 'In no language,' says Dr Latham, 'in its oldest stage, is there ever a word giving, in its primary sense, the idea of *an* or of *the*. As tongues become modern, some word with a *similar* sense is used to express the relation. In the course of time, a change of form takes place, corresponding to the change of meaning.'

The definite articles originate uniformly in demonstrative pronouns. Eng. *the* is only a weakened form of *that* (Anglo-Sax. *thæt*). The same is the case with Ger. *der;* and Fr. *le*, Ital. *il* and *lo*, and Sp. *el*, are all from the Lat. *ille*, 'that.' In like manner, *an* or *a* is from the old form of *one* (ane); Ger. *ein* is both *one* and *a;* and so are Fr. *un*, Ital. and Sp. *uno*, both from Lat. *unus* = *one*.

In the Scandinavian tongues, the article is attached to the end of the word; the Danish, for example, writes *kong-en*, the king; *hus-et*, the house.

A'RTICLES OF WAR are regulations made for the government of the military and naval forces of the country. They are of three classes—1. Those relating to the army, including therein the forces in India, according to the provisions of the 21 and 22 Vict. c. 106; 2. Those relating to the marine forces; and 3. Those relating to the navy.

1. *A. of W. for the Army.*—These are regulations or ordinances issued under the authority of the annual MUTINY ACT (q. v.), and which Articles that act provides shall be judicially taken notice of by all judges and in all courts whatsoever; and copies of the same printed by the Queen's printer shall, as soon as may be after the same shall have been made and established by Her Majesty, be transmitted by Her Majesty's Secretary of State for War to the judges of Her Majesty's superior courts at Westminster, Dublin, and Edinburgh respectively, and also to the governors of Her Majesty's dominions abroad; provided that no person within the United Kingdom of Great Britain and Ireland, or within the British Isles, shall by such A. of W. be subject to be kept in penal servitude, or to suffer any punishment extending to life or limb, except for crimes which the act expressly declares shall be so punishable. And for the enforcement of such A. of W., a power is given to the crown to erect, or grant authority to convene, *courts-martial* with the jurisdiction to try and punish offences according to the Articles themselves and the provisions of the Mutiny Act. In order, however, to limit as far as possible the power conceded to the crown in this matter, it is enacted that nothing therein contained shall be construed to exempt any officer or soldier from being proceeded against by the ordinary course of law; and that where he is accused of any offence against a subject of the realm, punishable by the known laws of the land, he shall be delivered over to the civil magistrate. The military offences against which these A. of W. are directed, relate to the soldier's duties and obligations; to crimes and offences and their punishments; to court and to military rank. The military o offences referred to are those against divi perjury, mutiny and insubordination, des absence without leave; offences in the f garrison, or quarters; drunkenness, disgr duct, false returns, billets and carriages, and miscellaneous offences. By the 3d Articles it is ordered that every rec within ninety-six hours after recruit the 40th and 46th of the Articles re and shall, within ninety-six hours, but than twenty-four hours, make the f before some qualified authority: '*I That I will be faithful and bear to her Majesty, her heirs and succes I will, as in duty bound, honestly de defend her Majesty, her heirs and su person, crown, and dignity, against all en will observe and obey all orders of her M heirs and successors, and of the ge officers set over me. So help me God.*' article also deserves notice. It is to that whenever any military forces s embarked on board ships of war or tra officers and soldiers of such forces shal time of embarkation on board ship, stri themselves to the laws and regulatio for the government and discipline of shall consider themselves, for these pu poses, under the command of the sea the particular ship, as well as under officer of the fleet (if any), to which belongs. See A. of W. for the Marine Fo

2. *A. of W. for the Marine Forces* are the made under the authority of another annu Act, which relates exclusively to the roy forces; but, unlike the A. of W. for the a do not issue directly from the crown, but by the Lord High Admiral of the navy, commissioners for executing that office, an expressly authorised so to be made by the tion of the last-mentioned Mutiny Act. exception, they are in themselves very same as the A. of W. for the army. T exclusively, however, to the marine force *shore*, and this specialty is very anxiously in the preamble of the act, which proce recital that 'the said forces may frequentl tered, or be on shore, or sent to do duty board transport-ships, or merchant-shi or they may be under other circu they will not be subject to the la government of Her Majesty's forces course, while on board, and doing duty Her Majesty's ships or vessels in co marines, like the other naval forces, are the A. of W. made for the government of

3. *A. of W. for the Navy.*—In regar articles or regulations, the navy is differ ated. Unlike the army or the marine shore, the navy is not controlled or gover annual Mutiny Act, but the A. of W. rel are contained in, and expressly enacted by Discipline Act, 29 and 30 Vict. c. 109 (1 still supplies the law of the sea-service. A. of W. are eminently Draconian in th it need scarcely, however, be said that Courts vastly mitigate them in practice. Naval A. of W. authorised by parliament contained in the 13 Chas. II. c. 9, which have been drawn up by Admiral Monta wards Earl of Sandwich, with the appr Lord Chancellor Clarendon and other dis members of the privy council. But that a its subsequent supplementary acts were,

England, are the articles of religion ... agreed upon by the archbishops and ... both provinces and the whole clergy ...vocation held at London in the 4th ...beth, 1562, under Archbishop Parker. ... ...ear view of the history of these im...les, we must go back to the promul... original ones, forty-two in number, ...d Edward VI. The council appointed ...f Henry VIII. to conduct the govern... the king's minority, was for the most ... ...ly disposed towards the Reformed ... and the management of church affairs ... st entirely upon Archbishop Cran... year 1549, an act of parliament was ...wering the king to appoint a commis... ...ons, to make ecclesiastical laws. ... ... commission of 8 bishops, 8 divines, ... and 8 lawyers (amongst whom were ...ley, Hooper, Coverdale, Scory, Peter ... ...e Hales, &c.) was appointed in 1551, ... first acts was to draw up a code of ...f faith. These were forty-two in number, ...orth by the king's authority in 1553. ...rnet make it appear that these forty-... were agreed upon in the convocation ... in 1552, but this was not the case. ...n his quaint way of this convoca... ...t it had 'no commission from the ...dle with church business, and,' he ... convocation in itself is born deaf and ... ...at it can neither hear nor speak con... complaints in religion till first *Ephphatha*, ... opened," be pronounced unto it by ...thority. However,' he continues, 'this ...onvocation is entitled the parent of those ... articles which are printed with this title, *de quibus in Synodo Londinensi* 1552 A.D. ... ... *et alios convenerat*.' To these articles ... Catechism, and there is no doubt ...ng had the principal hand in their ..., for he owned before Queen Mary's ...that they were his doing. But immedi... ...ir publication, Edward died, and one ... of the convocation summoned ... ...ment in the first year of Queen ... to declare that these forty-two articles had not been set forth by the agreement of that House, and that they did not agree thereto. In 1558, Elizabeth succeeded her sister. In 1559, Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed Church. Parker applied himself to this work, and for the purpose, revised the forty-two articles of King Edward, rejecting four of them entirely, and introducing four new ones, viz., the 5th, 12th, 29th, and 30th as they now stand, and altering more or less seventeen others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to thirty-nine. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to thirty-eight. From these thirty-eight there was a further omission, viz., of the first half of the 20th article, which declares that 'the church hath power to decree rites and ceremonies, and hath authority in controversies of faith.' As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571, the articles once more underwent revision. Archbishop Parker and Bishop Jewel made a few trifling alterations, and the 29th being restored, the convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe 'such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments.' There still, however, remained some difficulty as to which was the authorised copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the thirty-nine articles as they now stand. 'His Majesty's Declaration,' which precedes them, and directs that they shall be interpreted 'in their literal and grammatical sense,' was prefixed by Charles I. in 1628.

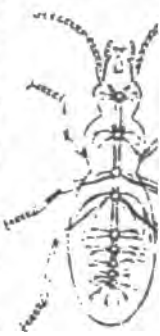
It may be interesting to know from what other sources the thirty-nine articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melanchthon.

The thirty-nine articles have been described as 'containing a whole body of divinity.' This can hardly be maintained. They contain, however, what the Church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the Church of Rome, and of certain Protestant sects. As far as they go (and there are many things unnoticed by them) they are a legal definition of the doctrines of the Church of England and Ireland; though it is to the *Book*

of Common Prayer that members of that communion look for the genuine expression of her faith. They were adopted by the convocation of the Irish Church in 1635, and by the Scotch Episcopal Church at the close of the 18th century. Corpus Christi College, Cambridge, contains the only copies of the A. in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the A. of 1562, and the English manuscript of the A. of 1571, each with the signatures of the archbishops and bishops who subscribed them. See *An Account of the Thirty-nine A.*, by Dr Lamb.

For other 'Articles,' see LAMBETH, PERTH, and SCHMALKALD.

ARTICULATA or ARTICULATED ANIMALS, one of the great primary divisions of the Animal Kingdom, according to the system of Cuvier, who in this is followed by recent naturalists generally. The term indicates not the possession of articulated members, but the articulated structure of the whole body. The A. are composed of segments articulated or jointed together in a line, each segment being formed of one or more rings, which in some appear externally as mere transverse folds in a soft skin, but are often covered with a hard substance similar in chemical composition to the bones of vertebrated animals. To this the muscles are attached, and it has sometimes received the name of an external skeleton—a name perhaps suggestive of closer and more numerous analogies to the bony framework of the vertebrated animals than actually exist. In some of the A. the rings are almost equally developed; in others, the difference is very great. They are divided into those which have, and those which have not articulated members; the first subdivision including Insects, Arachnida, Crustacea, and Myriapoda; the latter, Annelida and Entozoa. Some naturalists rank Cirrhopoda (Barnacles, Acorn-shells, &c.) among the A., and regard them as intermediate between these two subdivisions; others follow Cuvier in placing them among the Mollusca. The Rotifera (or wheel animalcules) are also placed by some in the second subdivision of the A., but their right to be so placed is by no means well established. It is in the first subdivision only that the rings are very distinctly grouped in what are called segments of the animal; and even in the Myriapoda (Centipedes, *Juli*, &c.) they often seem little else than mere repetitions of each other; whilst in some of the Crustacea, as the Crabs, the trunk becoming encased in a hard envelope, the segments become immovably united, so that they no longer appear as distinct. A few only of the lowest A., however, are destitute of a distinct head, in which are placed the eyes and other organs of special senses, with regard to which there is considerable difference in the different classes. In it also they usually have jaws for seizing their food and cutting or tearing it to pieces. Their jaws do not open vertically, as in vertebrate animals, but laterally; and there are frequently several pairs of them. Some, however, have the mouth adapted merely for suction. The alimentary tube often proceeds in a straight line from one extremity of the body to the other; and when it is convoluted, its convolutions are usually few. There is no proper heart; but instead of it, we find a *dorsal vessel*, a tube carried along the central line of the body near the back or upper side, and divided in a manner corresponding with the division of the body into rings and segments; a general connection being thus maintained, whilst each segment or each ring has to a certain extent a system of circulation for itself. Respiration is effected either by gills (*branchiæ*), which is the case in those A. that live in water, or by air-tubes (*tracheæ*) and sacs; and the aëration of the blood taking place not merely in one or two, but of the rings, great muscular power and are maintained without a very active cir The muscular power is, indeed, greater in m to the size in the A. than in any The blood is usually white; in some o alone it is red; but this colour (see AN not indicate any approach to the higher animals, although even Cuvier appears regarded it as a reason for assigning to the A the first place among the A. The nervous exhibits a great similarity throughout the who A., and corresponds in its general plan wi system of circulation. It consists of a series nervous masses or *ganglia*, arranged in a cha the central line of the body on the under the animal. A ganglion in the head is often the brain, and from it proceed the optic ner other nerves of the special senses; but it means perfectly corresponds to the b tebrate animals. There is usually a each ring. The ganglia themselves are composed of two halves, more or less distinctly separated; the connecting cord also is double. In those A. which have articulated limbs, the ganglia are largest in the parts of the trunk with which the limbs are connected, whilst they almost disappear from the more unimportant rings; in the Crabs, and some other tailless or very short-tailed Crustacea, they are condensed into two masses.



Nervous System Insect.

The remains of the A. in the fossiliferous rocks are numerous, although often so fragmentary and imperfect that the determination of genus and s impossible, and their complex organisation c thoroughly investigated. It is evident, h that many of them differed much from any now known to exist, and changes can be s from one geologic period to another; Crustacean family of the Trilobites (q.v.), fo being found only in the palæozoic rocks. which are regarded as the tracks and marine worms, appear among the earlies animal life.

The corps comprises six infantry companies, a grenadier company, a light-infantry company, a rifle company, and an artillery company. Until 1849, the members elected their own officers; but since that year the crown has appointed them on the nomination of the lieutenancy of the city of London. The lieutenant-colonel appoints the non-commissioned officers.

ARTILLERY CORPS. Referring to CANNON for a history of large pieces of ordnance, we here treat of the organisation of the artillery service.

The larger weapons, before the invention of gunpowder, were sometimes called *engines of war*, sometimes *artillery*, and were worked by strong and rough soldiers, who needed no particular apprenticeship to that art. When, however, large balls of iron came to be propelled by the irresistible force of gunpowder, a great revolution gradually took place, though garrison-guns and siege-guns were improved more rapidly than field-guns. Nevertheless, field-guns changed the whole aspect of military tactics; for it became necessary that an army should form in order of battle at a much greater distance from the enemy than in older times. And when the cannon were made more rapidly movable, so did tactics vary. Gradually, a body of men were set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the manœuvring of heavy masses. The French were the first to make these researches; after them, the English; and still later, the Germans. During the Thirty Years' War, an important step was taken in Germany—that of including the artillerymen, who were till then a sort of guild, as a component in the regular army. Gustavus Adolphus in Sweden, Frederick II. in Prussia, and Napoleon I. in France, all attached a very high degree of importance to the artillery as an arm of the service. After the great wars in the beginning of the present century, nearly all the states of Europe formally recognised the artillery as the third great branch of military service (next after the infantry and cavalry); indeed, in almost all present armies, it takes practically the first place.

A. C., or artillerymen, are divided into land-artillery and marine-artillery. The land-artillery is divided into field, coast, garrison, and siege artillery. The field-artillery is subdivided into horse and foot. There are also the special appellation of reserve, light, and heavy artillery. In most European states, the artillerymen are divided into regiments, battalions, brigades, and companies; but in Britain the whole form one enormous regiment, which is expanded or contracted according to the exigencies of the service. See ARTILLERY, ROYAL REGIMENT OF. When military men speak of *the* field-artillery, they usually include cannon, carriages, horses, ammunition, and stores of every description, as well as the artillerymen. The distinction between heavy and light artillery depends on the size of the cannon, and the weight of the shot and shell propelled from them. For obvious reasons the construction of very large field-guns is avoided. Military men are not quite agreed as to the precise figures; but there was in the time of Napoleon I. a general concurrence in opinion that a well-appointed field-force should have two or three artillery guns to every 1000 infantry, and five or six horse-artillery guns to every 1000 cavalry. The proportion is necessarily affected by the kind of country and the amount of available transport. During the Peninsular War, Wellington had seldom more than 1 gun to every 1000 soldiers; when he entered France, he had

3 to the 1000. Napoleon preferred 2 per thousand, with a larger supply of ammunition than had before been deemed necessary; and many foreign governments followed his example. Since the Franco-German war, it is held that there should be always with the army 3 guns per 1000 infantry.

ARTI'LLERYMAN. See ARTILLERY CORPS; ARTILLERY, ROYAL REGIMENT OF.

ARTI'LLERY, PARK OF, is a collective name given to the whole of the guns, carriages, ammunition, and other appurtenances essential to the working of siege or field A. Besides reserve guns and carriages, there belong to it the ammunition wagons, as well for the infantry and cavalry as for the A., the implements and materials necessary for repairing and completing equipments, harness-stores, field-forges, laboratories, and (in some armies) transport and provision wagons. The *personnel* of a park of A. consists of A. officers, non-commissioned officers, and artillerymen; besides a large number of smiths, wheelwrights, saddlers, armourers, drivers, and other mechanics and labourers. Sometimes the term is applied to the place selected, as well as to the vast military stores collected there. During a siege, the park of A. is stationed out of reach of the enemy's fire, but in communication with the besiegers' trenches. If possible, its locality is chosen close to some good line of communication, either road or river. All pioneering or intrenching tools, and all handicraft implements, are arranged in rows nearest to the field of action, with requisite spaces for the convenience of the storekeepers and workmen. Behind these are the materials for erecting batteries, making fascines and gabions, and filling sand-bags. Furthest removed from the enemy are the magazines, in and near which shot and shell and other kinds of ammunition are stored. A large park of A. is usually divided into park-columns, for the sake of better supervision. Under some circumstances, the engineering park is distinct from the park of A., especially where these two arms of the service are so mutually independent as in the British army.

ARTI'LLERY, ROYAL REGIMENT OF, is the collective name for the whole of the A. belonging to the British army. Under ARTILLERY CORPS, the origin of similar bodies on the continent of Europe is briefly noticed. There was no regular regiment or corps of A. soldiers in the English army till the time of Queen Anne, when the present Royal Regiment was formed. Since that period, from some anomaly which is not easily explained, all the additions have been made to the same regiment, instead of forming new regiments, to be combined into a division or corps. The regiment is now almost an army in itself; and to increase the anomaly, it comprises horse as well as foot. The foot-A., with medium guns, attend infantry in the battle-field; and with heavier guns, besiege and defend fortified places; while the horse-A., with lighter guns, accompany the cavalry. The mounted artillerymen were organised into a body long after those who manœuvre on foot. Though both corps form one regiment, they have distinct designations—the *Royal-A.*, and the *Royal Horse-A.* Besides these two corps, the regiment is considered to include the *Master Gunners* and the *Coast Brigade*.

The regiment has varied from 18,000 to 36,000 strong (including those placed upon the East India establishment), during the last 20 years. Formerly, the foot were divided into *battalions*, and the horse into *troops*. Each company, with its quota of guns and stores, constituted a *field-battery*; and each troop, with its quota, constituted a *horse-battery*. The terms 'company' and 'troop' are now altogether abandoned as being properly applicable infantry and cavalry, and both foot and horse divided into *brigades* and *batteries*. Under the organisation, there was no major among the wo ing officers, the designations being captain, seco captain, and lieutenants. The grades now major, captain, and three lieutenants per batt A battalion in former times usually comprised e companies. When the number of the regim was 18,000, it comprised 119 companies and two averaging somewhat over 150 men each · at times, the companies varied from 130 to each. At present, a brigade usually co batteries of horse, or 10 of field, or 7 son artillery. A horse-battery has 5 151 men; a field-battery (at home), 5 152 men; and a garrison-battery, 4 from 100 to 150 men, according to position in its charge. The brigade are designated by ordinal numbers; of horse-A. are designated by letters, (omitting E). In the old nomenclatur panies and battalions of foot-A. had num 6th company, 12th battalion; and the horse-A. were designated by letters.

The army estimates for 1874—1875 will af correct information concerning the present st the Royal Artillery:

ROYAL FOOT-ARTILLERY.

Commissioned officers,	1,139
Non-commissioned officers,	2,385
Rank and file,	25,511
Horses,	

ROYAL HORSE-ARTILLERY.

Commissioned officers,	249
Non-commissioned officers,	416
Rank and file,	5,053
Total,	34,766
Horses,	
Total,	

Of this number, 12,234 are placed at the d of the East Indies, to be paid for out of revenues.

The internal organisation of the Royal A., the relation between the men and the guns w they serve, as well as some specialties of the ser kinds of service, will be described under BAT For recent changes, see the article WAR-SER in the SUPP., Vol. X.

ARTI'LLERY, SCHOOLS OF. The first sc for A. instruction was established by the Venet in the beginning of the 16th c. Soon afterw Charles V. established similar schools at Burgos in Sicily. The French founded a school of prac A. in 1675; and in 1679, they added to it a theore school at Douai. At present, France has no fe than seven such establishments. Saxony had A. school in 1766; but the other German were more tardy in this work. In Pru artillery and engineer schools are c most of the European states, a se these two arms of the science is schools of A., the officers' studies matics, as much of physics and ch necessary to the duties of the and permanent fortification, garriso tactics, military history and topograph surveying and sketching, drawing from the &c. The practical exercises include the serving tiring of guns and mortars, the laying out constructing of field-batteries, and the operati the laboratory and A. workshop.

of a whole spike of flowers), as in the
Bread-fruit (q. v.). There are upwards

Bread-fruit (*A. incisa*).

own species, natives exclusively of the
he milky juice of some yields CAOUT-
); and that of a few species is so bland
used as a substitute for milk (see Cow-
he juice of others is, however, very
poisonous, as that of *Antiaris toxicaria*, the Antjar poison, one of the poisons called Upas by the Javanese. The seeds are always wholesome; and those of the *Musanga* of the Gold Coast of Africa, and of *Brosimum alicastrum* in the West Indies, are eaten as nuts. The fibrous bark of the Bread-fruit Tree is made into cloth in the South Sea Islands, and that of other species of *Artocarpus* is capable of being used in the same way. The bark of *Antiaris* or *Lepurandra saccidora* is used in Western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted, and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack. The fibrous bark of *Cecropia peltata*, or Trumpetwood, is used for cordage in tropical America. The stem and branches are very hollow, and are used for wind-instruments. The wood of some species is valuable, as that of the *Brosimum* or *Piratinera Guianensis*, the Snakewood of Demerara.

ARTOIS was formerly a province of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of *Pas-de-Calais* (q. v.). The capital of A. was Arras. Louis IX., in 1239, made A. a county, and gave it to his brother Robert, who was succeeded by his son, Robert II., surnamed Posthumous, who died in 1302. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659 and 1678. Charles X., in his early life, and also after his abdication, was known by the title of Count d'Artois.

ARTS, DEGREES IN. The term 'Arts,' or 'Liberal Arts,' as technically applied to certain studies, came into use during the middle ages, and on the establishment of universities, the term 'Faculty of Arts' denoted those who devoted themselves to Science and Philosophy, as distinguished from the faculty of Theology, and afterwards of Medicine and Law. The number of 'Arts' embraced in the full medieval course of learning was seven: Grammar, Logic, Rhetoric (constituting the *Trivium*), Music, Arithmetic, Geometry, and Rhetoric (the *Quadrivium*). The terms Master and Doctor were originally applied synonymously to any person engaged in teaching. In process of time, the one was restricted to the liberal arts, the other to Divinity, Law, and Medicine. When regulations were established to prevent unqualified persons from teaching, and an initiatory stage of discipline was prescribed, these terms became significant of a certain rank, and of the possession of certain powers, and were called *gradus*, 'steps' or 'degrees.' The passing of the initiatory stage, said to have been first instituted by Gregory IX. (1227–41), conferred the title of *bachelor* (q. v.), and an additional course of discipline and examination was necessary to obtaining that of *master*. The title of Master of Arts originally implied the right, and even the duty of publicly teaching some of the branches included in the faculty of Arts; a custom which is still retained, to some extent, in the German universities, but has fallen into disuse in Britain and France, where the title is nearly honorary. The subject will be more fully considered under the general head of DEGREE.

ARUM, a genus of Monocotyledonous plants, belonging to the natural order *Araceæ* or *Aroideæ*. This order consists of herbaceous plants, some of which are stemless, and shrubby plants, some of which are arborescent, and some climb by aërial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The flowers are male and

female, naked, arranged upon a *spadix*, which is generally enclosed in a *spathe* (q. v.); the male flowers at the upper part of the spadix, and the female flowers at its base. The stamens are definite or indefinite in number; the anthers sessile, or nearly so, and turned outwards. The ovary is free, generally one-celled, many-seeded; the stigma sessile. The fruit is succulent, the seeds pulpy, the embryo in the axis of fleshy or mealy albumen, with a lateral cleft in which the plumule lies; the albumen, however, is wanting in some plants of the order.—As thus defined, this order contains almost 200 known species, natives chiefly of tropical countries, but some of the herbaceous kinds belong to colder climates.—The limits of the order are, however, sometimes extended, so that it includes as suborders *Typhaceæ*, *Pistiaceæ*, &c.—The genus *A.* has a convolute spathe; the spadix naked at the point. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable heat. Flowers, in general, are slightly warmer than the air around them, the heat being produced by the union of oxygen with some starch-like ingredient in the sap of the petals, or other parts of the flower; for flowers, instead of absorbing carbonic acid gas and giving off oxygen in the sunshine, like the leaves of plants, absorb oxygen and give off carbonic acid, like the lungs of animals. But flowers, in general, are only one degree, or one degree and a half, warmer than the air, whereas the flowers of some of the Arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been found to have a heat of 121° F., while that of the air was only 66° F. The only British species is *A. maculatum*, Cuckow-pint or Wake-robin, which is abundant in England and in most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, enclosing a rather short violet or brownish red spadix. It produces scarlet berries, 1—2 seeded, about the size of peas, clustered upon the spadix. The root has a burning acrid taste, which, however, it loses in drying or boiling. In a fresh state, it is a drastic purgative, too violent for medicinal use; and, indeed, as well as the leaves, is an active poison: yet a ing farina is prepared from it, after has been removed. This farina is a is known in England by the name of or Portland Arrow-root. It was formerly to a considerable extent in the isle of Portland also the tubers (corms) themselves are eaten country-people. A cosmetic, called Cyprus is made from them in France, and they are Switzerland as a substitute for soap. They indeed, a quantity of *Saponine*, to whic acridity is supposed to be owing. They los of their acridity in drying, and were f in medicine as a stimulant in im a diuretic in dropsies, and an expe complaints. The plant is extensively India for food.—*A. Indicum* is also m in Bengal for its esculent stems and tubers.—Acridity in the juice, and the pre an amylaceous substance of very nutritious from which the acrid juice is easily separa characteristics of many plants of this order. larly species of *Caladium* and *Colocasia* for food in warm countries, under the n (q. v.), Eddoes, &c.—*Amorphopallus c* (*A. campanulatum*), called Ol by the very much cultivated in some parts of roots (flat underground corms), which fo important article of food; yet in a fresh so acrid that it is employed as an external st and is also used as an emmenagogue. Othe of *Amorphopallus* are still more powerfull lant.—Two large species of *Arisæma*, anothe very closely allied to *A.*, were found by Dr to afford food to the inhabitants of the Himalaya at an elevation of upwards o feet. Their tuberous roots are bruised by of wooden pestles, and thrown into small p water, until the commencement of acetous fe tion, when the acridity is mostly dissipated; process is so imperfect that cases of injury f poisonous juice are frequent. The tubers of *atrorubens* (*A. triphyllum* of Linnæus), a nativ United States, and there known as Dragon Indian Turnip, yield a pure white starch of *A. maculatum*. Their medicinal uses similar; they are employed as a stimulant secretions.—The Dragon-plant, *A. Dracu* native of the south of Europe, is not uncon gardens in Britain, although it has a can smell, and its emanations are apt to produ ache and other disagreeable effects. It has lar appearance—straight stalks, three fe curiously spotted like the belly of a snak peculiar acridity of the *Araceæ* is most rem displayed in the Dumb Cane (q. v.).

Arum maculatum.

a, leaves and root; *b*, spathe, with base of spadix exposed; *c*, fruit.

A'RUN, a river rising in St Leonard's in the middle of North Sussex, and after of 35 miles, falling into the English Cha canal unites it with the Wey, a feeder Thames.

A'RUNDEL, a small town 5 miles inla the mouth of the Arun, in a tertiary and cl trict, on the south side of the South Down S.W. of Sussex. It consists mainly of a ve street rising from the right bank of the A summit of a hill crowned by a castle. The navigable for vessels of 150 tons up to Bark and timber are the chief exports. Pop 2956. A. was disfranchised by the Reform Bill It is governed by a mayor, four aldermen, an councillors. The castle, from its site, is a object, and was built soon after the Norm quest. It is an oblong, including 5½ acres w

ARVICOLA. See VOLE.

A'RYAN RACE, A'RYAN LANGUAGES. The name Aryan (less properly, Arian) Race or Aryan Family of Nations is now generally used to designate that ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It consists of two branches, geographically separated, an eastern and a western. The western branch comprehends the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, and the Finns of Lapland (see EUROPE); the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of Northern Hindustan (see HINDUSTAN). The evidence on which a family relation has been established among these nations is that of language. Between Sanscrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages, i. e., Italian, French, Spanish, Portuguese, Wallachian), Celtic (once the language of great part of Europe, now confined to Wales and some parts of Ireland and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages — including English — and of the Scandinavian), and Slavonic (spoken in a variety of dialects all over European Russia and a great part of Austria), the researches of philology have within the present century established such affinities as can be accounted for only by supposing that the nations speaking them had a common origin. No one of these nations, whether existing or historical, can claim to be the parent nation of which the others are colonies. The relation among the languages mentioned is that of sisters — daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of Nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifactions. By skilful interpretation of their indications, aided by the light of all other available monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point, as almost all ethnologists are agreed, to Central Asia, somewhere probably east of the

Caspian, and north of the Hindu Kush and Paropamisan Mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this centre, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black Sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanscrit writings (the Veda), the Hindus style themselves Aryans; and the name is preserved in the classic Arii, a tribe of ancient Persia, Aria, the modern Herat, and Ariana, the name of a district comprehending the greater part of ancient Persia, and extended by some so as to embrace Bactriana. Ariana, or Airyana, is evidently an old Persian word, preserved in the modern native name of Persia, Airan or Iran. *Arya*, in Sanscrit, signifies 'excellent,' 'honourable,' being allied probably to the Greek *ari*(stos), the best. Others connect it with the root *ar* (Lat. *arare*, to plough), as if to distinguish a people who were tillers (*earers*) of the earth from the purely nomadic Turanians or Turks.

The several members of this ethnological group will receive special notice each in its place. As to the hypothetical mother-nation—the primitive Aryan stock before separation, it might seem impossible to affirm anything beyond its mere existence and locality. But the ethnologist does not content himself with this. In an admirable essay on *Comparative Mythology* (Oxford Essays, 1856), Professor Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilisation is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of the family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organised family life there was superadded a state organisation with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Müller is so interesting that we take the liberty of quoting it entire. 'It should be observed,' he says, 'that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong generally to the common heir-loom of th language. The proper appreciation of this fa general bearing will shew how a similar made by Niebuhr, with regard to Greek an requires a very different explanation from th that great scholar, from his more restricted view, was able to give it. It will shew Aryan nations had led a long life of peac they separated, and that their language individuality and nationality as each colony in search of new homes—new generations new terms connected with the warlike and turous life of their onward migrations. Hen that not only Greek and Latin, but all Ary guages have their peaceful words in c hence it is that they all differ so strau warlike expressions. Thus the domestic generally known by the same name in in India, while the wild beasts have even in Greek and Latin.'

In this mainly pastoral life, the more impo the primitive arts were known and exercise were tilled; grain was raised and ground int food was cooked and baked; cloth was wo sewed into garments; and the use of the even of iron, was known. The numbers a a hundred had been named, the decimal being followed. The name for a thousand come into requisition until after the dispersi differs in the different Aryan tongues.

Finally, it was among the yet undivided while abstract language did not yet exist, word was a metaphor, and the setting of example, could only be expressed by his and dying, that those stories of gods, monsters originated, which, with more variety, but still with a family-likeness, fo pagan mythology of every member of the gr

AS was the designation both of a Roman (called also *libra*) corresponding very nearl English *pound* (q. v.), and also of a coin mad mixed metal *aes*, or bronze. The As (coin) no doubt weighed a (Roman) pound; but gradually reduced to $\frac{1}{96}$ of a pound, and e It is thus difficult to assign any fixed valu *As*. About 270 B.C., the denarius (= 8½d.) c

As.

10 asses; so that the value of the As was little more than 3 farthings; when 16 asses the denarius, the value was about a halfpe was by the *sestertius* (q. v.) that money was r at Rome. The oldest form of As usually figure of an ox, a sheep, or other domestic (*pecus*); from which it is usually supposed Latin word for money, *pecunia*, is derived.

ULCIS (i.e., Sweet Asa), a drug in high ...ng the ancients as an antispasmodic, ... and diuretic; also for supposed virtues ...xtraordinary kind, such as neutralising ... of poison, curing envenomed wounds, ... to the blind, youth to the aged, &c. ... ...stimated by its weight in gold. The ...Cyrene caused a figure of the plant pro... to be struck on the reverse of their coins, ...sometimes called *Laser Cyrenaicum*. The ...f the genus *Thapsia* (of the natural order ...e), either *T. Garganica*, or a nearly allied ...*T. Silphium*—perhaps the drug was pro... both. They are natives of the south of ...d of Barbary, and appear to be very active ...

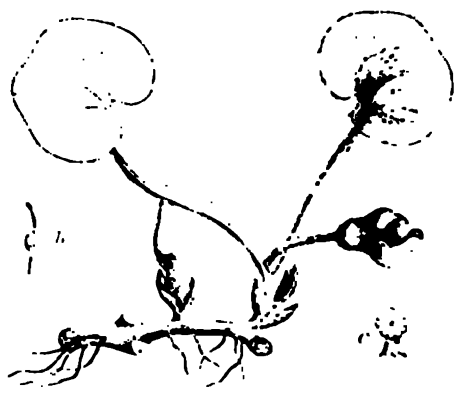
TIDA, or **ASSAFŒTIDA** (i.e., Fœtid Asa ...a gum-resin, which has been supposed to ... with the exuded juice of the *Silphion* ...ides, so highly esteemed among the Greek ...: but which, perhaps, was rather the *Asa* ... name is derived from the Persian word ... means *a staff*. This drug is brought ...ia and Afghanistan, and is procured by ...a milky juice which flows from the root ...nt *Ferula* (*Narthex*) *Asa*, which has been ...to the genus *Ferula* by Linnæus, and to ...by Dr Falconer. The root of the A. plant ...ld generally undivided; white inside, but ...black covering; and contains in its interior ...of juice of an overpowering odour, which ...mbles that of garlic. *Ferula* or *Narthex* ...radical leaves tripartite, their segments ...d, and nearly two feet in length. The ...is said by some to be obtained also from ...rsica, a plant which has the root leaves ...h divided, and all either tripinnate or ...nate. The name *Ferula*, like the Persian ...rs to the appearance of the stem of the ...*Ferula Persica* has long been propagated ...ly in Britain, and even brings its seeds ...on.

A. is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and Afghanistan, and also to the north of the Hindu Kush range of mountains. About April, the root-leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. A. is extensively used in medicine, and possesses stimulant and antispasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, A. is composed of the following substances: resin, 65 parts; volatile oil, 3·6; gum, 19·44; bassorin, 11·66; various salts, ·30. In many parts of the East, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

A'SAPH, St, a cathedral city and a station on the Vale of Clwyd Railway, stands on a small hill between the rivers Clwyd and Elwy, in the northwest of Flintshire, Wales. The cathedral is a cruciform building, 178 by 68 feet, and was built in 1284 on the site of a wooden structure founded before 596. It has a tower 93 feet high, is one of the smallest of British cathedrals, and stands on the top of the hill on which the city is built. Kentigern, or St Mungo, Bishop of Glasgow, and his disciple, St A., are said to have founded the see of St A. in the 6th c. The bishop, who has a revenue of £4200, is patron of 121 of the 148 benefices in the diocese. Pop. in 1871, 1900. St A., with the Flint district of boroughs, returns one member to parliament.

A'SAPHUS. See TELLOBITE.

ASARABACCA (*Asarum Europæum*), a plant of the natural order *Aristolochiaceæ* (see ARISTOLOCHIA), a native of Europe, growing in woods; rare, and perhaps not truly indigenous, in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic. The use of A., however, as an emetic has been much



Asarabacca (*Asarum Europæum*).
b, detached anther; *c*, style.

superseded by that of ipecacuanha, which is milder and safer. The powdered roots and leaves enter into the composition of cephalic snuffs, which cause

sneezing, and are employed as a counter-irritant in cases of headache, ophthalmia, toothache, &c. The plant contains a volatile oil, and a crystalline substance called *Asarine*, to which it seems to owe its active properties. The genus *Asarum* is distinguished by twelve horned stamens, distinct from each other and from the style, and by a bell-shaped three-lobed perianth. *A. Europæum* has a very short stem with two shining kidney-shaped leaves on long stalks, from the axil of which springs a single drooping greenish-brown flower.—A nearly allied species, *A. Canadense*, a native of Canada, is stimulant and diaphoretic, and is used under the name of CANADA SNAKEROOT, instead of *Aristolochia Serpentaria*. It is also called WILD GINGER, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.

AS'BEN, or A'ÏR, a country of Central Africa, situated in 15°—20° N. lat., and 6°—11° E. long. Pop. estimated at 64,000.. Its territory comprises a large amount of desert, as well as considerable tracts of mountain land. The inhabitants are chiefly of Berber extraction, and generally profess the religion of Mohammed. They are of a degraded character, and given to marauding. The climate is rather healthy, and generally hot and dry. The rainy season is from August till October. The soil in many places is fertile, producing the doom palm, dates, and senna. Dr Barth, the traveller, says of the aspect of the country: 'Rocky ground, overtopped by higher mountain masses or by detached peaks, and hollows overgrown with rich vegetation, and preserving for a longer or shorter time the regular form of valleys, succeed each other by turns, and constitute the predominant feature of the country of Asben.' The capital is Agades (q. v.).

ASBE'STUS, a mineral very closely allied to tremolite, actinolite, and hornblende, and which, along with tremolite and actinolite, is often ranked among the varieties of hornblende. It consists chiefly of silica, magnesia, lime, and oxide of iron, and is of a fine fibrous character, the fibres sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish colour. The variety called *Rock-cork* very much resembles cork, is soft and easily cut, and so light as to swim in water. *Rock-leather* and *Rock-wood* are varieties somewhat similar to rock-cork, but not so light. The finest fibrous variety with easily separable fibres is called *Amianthus* (from a Greek word signifying *unpollutible*, as A. is from a Greek word signifying *indestructible*), because cloth made of it was cleansed by passing it through fire. This cloth was used by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body unmixed. Amianthus has sometimes been used for the wicks of lamps, and is often employed to fill vinaigrettes, being moistened from time to time with a few drops of aromatic vinegar. The finest amianthus is found in the Tarentaise in Savoy. It is particularly abundant in Corsica. It is found also in Cornwall, at Portsoy in Scotland, and in several of the Shetland Islands. None of the varieties of A. are very common, but they are not unfrequent in serpentine and allied rocks in different parts of the world. Minerals which resemble A. in their fibrous character are sometimes called *asbestous* or *asbestiform*, and some of them are believed to be varieties of augite rather than of hornblende.

A'SCALON, or **ASHKELON**, a ruined city of Palestine, situated on the shore of the Mediterranean, 36 miles W.S.W. of Jerusalem, and 12 N. by W. of Gaza. It was in ancient times a fortified city, and the principal town of one of the five lordships of the Philistines. Its name often occurs in the history of the people of Israel in the Old Testament, where it is represented as falling at an early period into the hands of the tribe of Judah. Herod the Great embellished it with baths, palaces, and fountains; but in the subsequent wars with the Romans, it suffered much damage. There was a celebrated temple of Derketo, the Venus of the Syrians, at A., which is recorded to have been plundered by the Scythians, 630 B.C. After continuing long under the dominion of the Roman empire, the city came into the possession of the Saracens in the 7th c. In 1099 a great battle was fought on the plains of A., between the Crusaders and Saracens, when the Christians gained a decisive victory. The city, however, a number of years after, was recaptured by the Moslems, and held by them as a strongly fortified place until 1153, when it was taken by the Crusaders under Baldwin III. In 1187 it was retaken by the Saracens, but afterwards (1192) fell into the hands of Richard Cœur de Lion. Subsequently, being more than once dismantled and repaired during the wars between Richard and Saladin, it was reduced to desolation by Sultan Bibars in 1270.

The ruins of this ancient city occupy an extensive semicircular eminence, sloping gently to the east, but abrupt and steep towards the sea. Part of the walls are still standing, with the remains of Gothic churches, a palace, and several edifices of more ancient date, which attract the notice of the traveller and the antiquary.

A'SCARIS, a genus of *Entozoa*, or intestinal worms, of the order *Nematoidea* of Zeder, Cuvier, &c., and of the division *Sterelmintha* of Owen. The ascarides have a body approaching to cylindrical, but thickest in the middle. They inhabit the intestines of animals. The species are numerous. One of the best known is *A. lumbricoides*, often called the common round worm, which occurs in the intestines of man and of some of the lower animals, as the hog, ox, horse, &c., and which often occasions severe disease, and sometimes death, particularly when it ascends from the intestines to the stomach. Its presence even in its most ordinary situation in the small intestines, is attended with unfavourable effects upon the general health; and the greater the number present—which, however, is not usually large—the greater, of course, is the injury; although when they remain in the intestines, worms of this species are less injurious and less annoying than other, and even much smaller intestinal worms. In subjects otherwise diseased, they occasionally find their way out of the intestines into the closed serous cavities of the body, and even pass through ulcerated parts of the external integument; but the mouth is formed only for suction, and is provided with no

Ascaris lumbricoides (male).
One-third of the true linear dimensions; *a* is the head of the worm.

means of boring through the healthy intestine. An immense number of remedies (anthelmintics or vermifuges) have been proposed and used in order to expel this parasite, some of which are very effectual. They do not in general kill the worms, but act by making their dwelling-place disagreeable to them (see VERMIFUGE). It is, however, remarked by Küchenmeister, in his work on Parasites, that the

Ascaris vermicularis (male).
Magnified twenty-five diameters; a, the mouth.

Ascaris vermicularis (female).
Magnified eight diameters.

vermicularis, but the term *Ascarides* is often employed in medical works with exclusive reference to it; and indeed this name, derived from the Greek *askurizo*, to jump or move briskly, probably owes its origin to the liveliness of motion which this species exhibits. It has been recently discovered that its nervous system is very highly developed, consisting of many ganglia, with connecting and ramifying cords.

ASCENSION, one of the comparatively few single islands on the globe, being about 800 miles to the north-west of St Helena, and almost as far to the south south-west of St Matthew. It is said to have received its name from the circumstance of its having been discovered by a Spanish navigator on Ascension-day. It is nearly in the middle of the South Atlantic, the lat. of its fort being 7° 55′ 55″ S., and its long. 14° 25′ 5″ W. A. is 8 miles long by 6 broad; its area being about 35 square miles. Though it was discovered as early as 1501, yet it remained uninhabited till 1815, when, in connection with Napoleon Bonaparte's detention in St Helena, the English took possession of it. It is now used as a naval victualling-station and hospital. Pop. (census of 1871) 27, 15 being residents on the island, and 12 being in the Royal Naval Hospital. Like St Helena, it is of volcanic origin, and generally mountainous … one peak rising to a height of 2870 feet. From the extreme dryness of the climate, which, however, is healthy, the surface is nearly destitute of verdure. Among indigenous productions are the tomato, castor oil plant, and pepper; and various European vegetables are successfully cultivated.

ASCENSION, Right (Lat. *ascensio*, a rising; Ger. *gerade aufsteigung*), the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination. See Armillary Sphere. It is the arc of the equator

intercepted between the first point of Aries (q. v.), and the point at which the circle of declination passing through the star cuts the equator. Measured always from west to east, right A. on the heavens corresponds to longitude on the earth. The right A. of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right A. in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right A. is usually given, however, in time. The old term, *oblique* A., was given to the right A. of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right A. was called the 'ascensional difference.'

ASCE'NSION-DAY, or HOLY THURSDAY, one of the great religious festivals of the Episcopal, and also of the Roman Catholic Church. It is held on the fortieth day after Easter, and is intended to commemorate the ascension of Christ into heaven. It is one of the six days occurring in the year for which the Church of England appoints special psalms, and the same church also particularly recommends it as a fitting day for the receiving of the communion. Ascension-day has been observed from the earliest times of the Christian Church. St Augustine believes it to have been instituted either by the apostles themselves, or the primitive bishops succeeding them. Connected with the religious observances of this day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz., *beating the bounds, or riding the marches*, though their religious connection is apparently forgotten. See ROGATION DAYS and PERAMBULATIONS.

ASCETICISM. Among the Greeks, *askēsis* denoted the exercise and discipline practised by the athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions, or of severe virtue. In these senses it passed into the language of the early Christians. The language of St Paul in comparing the Christians to wrestlers who had to contend with Satan, the world, and the flesh, contributed to this. But the philosophy of the time had more to do with it, which held the freeing of mind from matter to be the means of union with God; or, at least, that the refraining from all luxurious pleasure was the way to restore the soul to its original purity. To understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion, that the Absolute or All is the only real existence; and that individual phenomena, especially matter in all its shapes, are really nothing, and are to be despised and avoided, as involving the principle of separation from the Absolute. The East, accordingly, is the native soil of A. The glowing imagination of the oriental carries the practice of it to a monstrous extravagance, as is seen in the frightful self-tortures of the yogis and fakirs, the suicides in the sacred Ganges and under the wheels of Juggernauth, and the practices now or recently prevalent of offering children in sacrifice, and of burning widows; most of which, however, have been humanely suppressed by the efforts of the B government. Buddhism, which may be consi as a kind of puritan revival or reform the methodism of the Indian re m— the principle beyond its previous ... its contemning the world; in its incul ... li of solitude and beggary, mortification ... bod and abstinence from all uncleanness an... exciting drinks, the object was to keep as ... detached as possible from this 'Vale of S ... HAFFENBURG, the chief town on the
nk of the Maine, in the Bavarian district
franken (lat. 50° 1′ N., long. 9° 7′ E.). It is
n an eminence, and has both a healthy and
e situation; but the streets are narrow,
r, and slope steeply towards the river. The
f Johannisburg, built between 1605 - 1614,
by Johann Schweikhardt, Elector of Mentz, and the favourite hunting residence of many of his successors, forms a quadrangle, with towers at each corner, and overlooks the whole town. Besides the collegiate church, the military barracks, and the town-hospital, A. possesses a Roman villa, built by the late King Louis, in imitation of the Castor and Pollux edifice discovered at Pompeii. It is celebrated for its manufacture of coloured papers, besides carrying on a considerable trade in wood, building-stone, tobacco, wine, &c. Pop. 9212, principally Catholics.

A. existed as early as the invasion of Germany by the Romans, who built a castle here. In 974, Otto I., Duke of Swabia and Bavaria, founded the collegiate church, which greatly increased the prosperity of the place. After Otto's death, it came into the possession of the archbishops of Mentz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it is the capital, it was ceded to Bavaria by Austria.

ASCHAM, ROGER, a distinguished English writer and classical scholar, was born in 1515 at Kirby Wiske, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and in 1530 entered St John's College, Cambridge, where he took his degree of M.A. in 1536. The study of the classics, especially Greek, had recently been revived at Cambridge, and the natural bent of A. impelled him with ardour to these studies. His reputation as a classical scholar soon brought him numerous pupils; and there being at that time no Greek chair, he was appointed by the university to read lectures in the public schools. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship, in which he excelled, and archery. In defence of the latter art, he wrote, in 1544, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII., he was rewarded with an annual pension of £10, equivalent to about £100 of our present money. About the same time, he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place as master of languages to the Lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of some offence he had taken at some persons in the princess's household. That he did not lose favour at court, however, is manifest, from his having soon after been appointed secretary to Sir Richard Morysine, ambassador to the court of Charles V. He spent three years in Germany, and published an account of his observations in that country. He also made a short tour in Italy. During his absence, he had been appointed Latin secretary to Edward VI. On his return, after the death of the king, the interest of Gardiner, Bishop of Winchester, secured his appointment to the same office under Mary; his pension also was doubled. His prudence and moderation preserved him from offending by his Protestantism. After the death of Mary, Elizabeth retained him at court in the double capacity of secretary and tutor, which he discharged till his death, in 1568. His principal work, *The Schoolmaster*, a treatise on classical education, was published in 1571 by his widow. His Latin letters and poems have been frequently reprinted. The best edition of the former is that of Elstob (Oxford, 1703). To an edition of his English works, by the Rev. J. Bennet (1767), is prefixed a life by Dr Johnson. — ASCHAM, a case for the reception of the bow, arrows, strings, and other accoutrements of the

archer, derives its name from the author of the *Toxophilus*.

ASCHERSLEBEN, a town in the district of Magdeburg, in the province of Prussian Saxony, lat. 51° 46′ N., long. 11° 27′ E. It is situated on the river Eine, is 7 miles distant from Magdeburg, and has a population of 16,734. The inhabitants are chiefly occupied in agriculture and gardening, but its trade is not very important. It has, however, considerable manufactures of woollens, linens, earthenware, &c. In the vicinity are the ruins of the old burgh of Ascania, the original seat of the House of Anhalt.

ASCIDIA, a Linnæan genus of marine mollusca, now much restricted as a genus, but the type of a family called *Ascidiadæ*. The name Ascidians is also commonly employed to designate all those tunicated mollusca which form the order *Saccobranchiata* of Owen, or in which respiration is carried on by means of gill-sacs (*branchial sacs*); and these are divided into Compound and Solitary Ascidians (*Aggregata* and *Solitaria*). The ascidians, along with the other *Tunicata*, are acephalous, or destitute of a head, and are enclosed, not in a shell, but in an elastic tunic with two orifices, composed of a substance apparently identical with the *cellulose* of plants, consisting only of carbon and hydrogen. Within the external tunic is a muscular membrane, regarded as corresponding to the *mantle* of other mollusca, and the openings of which agree with those of the tunic. The greater part of the cavity of the mantle forms a branchial sac, the lining of which, folded in various ways, constitutes the gills (*branchiæ*); and into it currents of sea-water are continually brought by the respiratory movements, passing out through the vent or anal orifice. Multitudinous *cilia* in the mouth and branchial sac, cause by their action this continual flow of water. The motion of the cilia is apparently quite involuntary. By this flow of water, the particles of food requisite for the animal are brought in, so that the aëration of the blood and the supply of the stomach are carried on together and by the same means. The œsophagus or gullet opens from the branchial sac, which is indeed regarded as probably an expansion of the upper part of it—a dilated pharynx. Under the branchial sac is the stomach; and the alimentary canal, which is more or less tortuous, finally returns upon itself, so that the two orifices are not far separate. The liver consists of follicles produced into tubes, and communicating with the stomach by a single opening. There is a heart and a circulation of blood, with the remarkable peculiarity of alternations in its course, the circulation every now and then pausing and being reversed. The transparency of many of the ascidians permits these and other internal movements to be easily observed. The nervous system is very simple, consisting of a single ganglion, situated between the mouth and the anal orifice, and which sends out filaments to both of them, and other branches over the surface of the mantle. The mantle is capable of contracting suddenly to eject a jet of water, and along with it any body the presence of which is disagreeable. It also contracts and ejects water, if the animal is touched, and this appears to be the only means of defence which these creatures possess. There is no eyes or of other organs of special sense.

climates. Some of them are culti-
and hothouses, upon account of
beautiful flowers, among the most
which are some of the species of *Asclepias*
Swallow-wort; perhaps none of them is
more highly or deservedly esteemed than *Stephanotis floribunda*, the fragrance of which equals its beauty, and which, since its introduction into British hothouses, has been sought for the bridal-garlands of the highest aristocracy. No hothouse climber is better known than *Hoya carnosa*, at each flower of which a drop of honey is always found to hang. A number of species are medicinal, as Indian Sarsaparilla (q. v.), (*Hæmidesmus Indicus*); Mudar (q. v.) (*Calotropis gigantea*), so highly prized in the East Indies; *Sarcostemma glaucum*, the Ipecacuanha of Venezuela; *Tylophora asthmatica* and *Secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is reckoned among the most valuable medicinal plants of India; *Cynanchum acutum*, which yields a purgative called Montpelier Scammony, and *Vincetoxicum officinale*, which possesses similar properties. Argel (q. v.), much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton (see ASCLEPIAS); and the stems of not a few species afford useful fibres, as those of the *Asclepias Syriaca* (see ASCLEPIAS), the Mudar (q. v.) and other species of *Calotropis*, natives of India and Persia, *Hoya viridiflora*, *Holostemma Rheedianum*, &c. The Mudar or Yercum fibre is very highly extolled by Dr Royle (*Fibrous Plants of India*). The bark of *Marsdenia tenacissima*, a small climbing-plant, yields a fibre called *Jetee*, of which the Rajmahal mountaineers make bowstrings, remarkable for their great elasticity, which they are supposed in some measure to owe to the presence of caoutchouc. The fibre of *M. Roylei* is used in Nepal. *Orthanthera viminea*, which grows at the base of the Himalayas, and has long leafless wandlike stems of ten feet in height, yields a fibre of remarkable length and tenacity, and which is supposed to be peculiarly suited for rope-making. The fibres of *Leptadenia Jacquemontiana* and *Periploca aphyllum* are used in Sinde for making the ropes and bands used in wells, as water does not rot them.—The milky juice of most species of A. is acrid, but in some it is bland, and they are used for food, as is the milk itself of the Kiriaghuna or Cow-plant of Ceylon (*Gymnema lactiferum*). A few species, as *Marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. The flowers of the genus *Stapelia* have a strong smell of carrion, and flies sometimes lay their eggs upon them, as it were by mistake.—No species of A. is a native of Britain.—The order is generally regarded as nearly allied to Apocynaceæ.

ASCLEPIADES, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of Cicero's life. He has been confounded with several other persons of the same name, and, in consequence, our accounts concerning him are both confused and contradictory. He seems to have wandered about considerably before he finally settled at Rome, as we read of his being at Alexandria, Parium on the Propontis, and Athens. It is not known either when he was born or when he died. A. was opposed to the principles of Hippocrates in medicine. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and 'gestation' or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration; for his leading doctrine was, that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He is said to have been very popular with the Romans on account of his pleasant and simple cures. His maxim was, that a physician ought to cure surely, swiftly, and agreeably

—a thing which, unfortunately, is not always possible. A. is also alleged to have been the first who distinguished between acute and chronic diseases, but his knowledge of anatomy was apparently very slight. The fragments of his which remain have been gathered together, corrected, and published by Gumpert, under the title, *Asclepiadis Bithyni Fragmenta* (Weimar, 1798).

ASCLE'PIAS, or SWALLOW-WORT, a genus of plants, the type of the natural order *Asclepiadaceæ*. The corolla is wheel-shaped and reflexed; the coronet fleshy, and each of its hooded tips has a horn. The species are generally upright—seldom climbing and twining—herbaceous plants with opposite, whorled, or alternate leaves. They are mostly American. The flowers are disposed in simple umbels between the leaf-stalks.—*A. Syriaca*, Syrian or Virginian Swallow-wort, sometimes called Virginian Silk, appears to be a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. It has an unbranched stem 4—7 feet high; thick, ovate leaves, covered with a grayish down on the under side; and large, stalked, nodding umbels of many dull red flowers, which diffuse a strong and sweetish odour. The whole plant is full of an acrid white milk, which contains caoutchouc. The young shoots are eaten in North America like asparagus, as those of *A. stipitacea* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fibre of its stalks, which is used for the manufacture of thread, cloth, ropes, nets, &c., in many parts of North America, and upon account of which it has been recommended for general cultivation in Europe. The fibre is said to be of very superior quality. The plant rapidly extends by its creeping roots, and readily becomes a weed, where it has been introduced.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, &c. The latter is a very ornamental garden-flower, and is called Butterfly Weed and Pleurisy Root in the United States, where it is frequent on stony and sandy grounds. *A. Curassavica* is called Wild Ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.

A'SCOLI (anciently, *Asculum Picenum*), an old city of Italy, and formerly the capital of a delegation in the States of the Church, lat. 42° 50′ N., long. 13° 37′ E. It is built on a hill, on the right bank of the Tronto, which formed the boundary between the late Roman and Neapolitan territories. Pop. (1872) 22,937. From the Adriatic, it is distant 16 miles west; from Ancona, 53 south. Its harbour (Porto d'Ascoli) has some coasting-trade, and is defended by two forts. The town is beautifully situated, commanding a fine view of the fertile valley through which the river flows, and of the rugged Apennines, which here rise to an elevation of 7212 feet.

In ancient times, it was inhabited by the Picени, the descendants of a colony of Sabines, who maintained their independence against the Romans until 268 B.C. Nearly two centuries after, they took a prominent part in the Social War; and on the taking of their town by Pompeius Strabo, were subjected to the severest punishments. The town was finally annexed to the Papal States by Pope Clement V. in 1426.

ASELLI, ASELLIO, or ASELLIUS, CASPAR, a celebrated Italian physician, was born at Cremona about the year 1581. He served at first as a military surgeon, but afterwards became professor of anatomy and surgery at Padua. In 1622, while at Milan, where he was in the habit of spending a great portion of his time, he discovered the lacteal vessels. Before A.'s time, anatomists had supposed that the chyle was carried from the intestines into the liver by the mesenteric veins. Happening one day to dissect a living dog, he noticed for the first time the multitude of little vessels, which suck up the nutritive portion of the food. At first, he took them for nerves, and did not pay particular attention to them; but on pricking one with the point of his scalpel, a white liquid spurted out, and the discovery flashed on him in a moment. He seems, however, never to have understood or described them with complete accuracy. He died at the age of 45, leaving a treatise on the subject of his discovery, which was published a year after his death. It is entitled *De Lactibus, sive Lacteis Venis, Quarto Vasorum Mesaraicorum Genere, Novo Inventis, Dissertatio*, and has several times been reprinted.

It is curious to reflect that such men as Gaspard Hoffman and Harvey zealously combated the opinions of A. It was nearly half a century before professional men admitted that a great discovery had been made in anatomy. See LACTEALS.

ASE'LLUS, in Ichthyology, a generic name now disused, but by which the cod and other *Gadida* were formerly sometimes designated. It is retained in the pharmacopœias, in the name of Cod-liver Oil, *Oleum jecoris aselli*.—The same generic name is now employed, in a different department of natural history, to denote a genus of small Isopod Crustaceans, one of which, *A. aquaticus*, is common in stagnant ponds in Britain, and is sometimes called the Water Hog-louse. This genus is the type of a family, *Asellidæ*.

A'SES. The singular of this name in Old Norse is *As*, pl. *Æsir*; in Gothic, *Ans*; in Saxon, *Os* (*Eo*). The A. are a race of gods in Northern or Scandinavian Mythology (q. v.), though not the oldest, yet the most powerful, like the Jupiter dynasty among the Greeks. They are usually considered as numbering twelve gods, and as many goddesses. The gods are—Odin, Thor, Baldur, Niord, Freyr, Tyr, Bragi, Heimdal, Widar, Wali, Uller, and Forseti; the best known of the goddesses—Frigga, Freyja, Idunna, Eira, and Saga. The worship of the A., or the Odin religion, was rooted not only among the nations of Scandinavia, but among the Germanic races generally, at least in its outlines. Besides other traces, proofs of its prevalence are to be found in a multitude of Gothic, Saxon, and Old High German proper names, many of which continue still in use, though their connection with German paganism passes unperceived: Oswald, Esmond, Oswin, Anselm, Ansgar, &c.

ASGILL, JOHN, an eccentric English *littérateur*, born about the middle of the 17th c. He studied for the bar, and at intervals during the whole of his checkered life transacted legal business in some form or other; but having early displayed a predilection for writing political pamphlets, he soon became involved, in spite of his cleverness, in serious pecuniary difficulties. Fortunately for *him*, parliament had just passed an act (1699) for the resumption of forfeited estates in Ireland, and commissioners were appointed to settle claims. A bright vision [illegible] across the mind of the much-harassed [illegible] sailed for the sister isle, and found [illegible] try wrangling in lawsuits. I[illegible] favour of the commissioners, [illegible] lucrative practice; and he even [illegible] influence to obtain a seat in the I[illegible] Some time, however, before taki[illegible]

A. published a most extraordinary

the highest degree. The A. prefers a loamy soil, but grows in almost any, and succeeds in situations too elevated or too exposed for most other trees. It has of late been extensively planted in elevated situations in some parts of the north of Scotland, and there, in the more sheltered glens, it grows to a large size. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the *Weeping A.*, with boughs bent almost straight down to the ground; the *Curled-leaved A.*, with dark-green wrinkled or curled leaves; and the *Entire-leaved A.*, a very curious variety, with many or all of the leaves simple (not pinnated), which has been erroneously regarded by

Common Ash.

a, a branch with leaves; *b*, flowers; *c*, fruit (on a considerably larger scale than the leaves and flowers).

some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, &c.—The SMALL-LEAVED A. (*F. parvifolia*) and the LENTISK A. (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.—The AMERICAN A., or WHITE A. (*F. Americana*), is readily distinguished from the Common A. by its lighter bark and paler green leaves. The flowers have a calyx, and the leaflets are shortly stalked and entire

(those of the Common A. being sessile and serrated). It is abundant in New Brunswick and Canada, but becomes rare to the south of New Jersey. The trunk often rises more than forty feet undivided. The wood is used for the same purposes as that of the Common A.—The RED A., or BLACK A. (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The BLACK A., or WATER A. of the New England States, New Brunswick, &c. (*F. sambucifolia*), is a large tree with buds of a deep blue colour.—The BLUE A. of Ohio, Kentucky, Tennessee, &c. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranes which extend their whole length.—The GREEN A. (*F. juglandifolia*), readily recognised by the brilliant green of its young shoots, is chiefly found in the middle states; and the CAROLINA A. (*F. Caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern states. Besides these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the Common A.—In the south of Europe grows the MANNA A., or FLOWERING A. (*F. Ornus*, called *Ornus Europæa* by some botanists), whose flowers have a 4-partite calyx, and four small yellowish-white petals. The tree has much resemblance to the Common A. From it the substance called MANNA (q. v.) is obtained by means of transverse incisions in the bark; but in very favourable situations, it flows spontaneously during the greatest heat of summer. Manna is chiefly collected in Calabria and Sicily. A nearly allied species, *F. rotundifolia*, a native of Greece and the Ionian Islands, yields it also in perhaps equal quantity. The Common A. is said sometimes to produce the same exudation in the same warm climates.

The MOUNTAIN A. is the ROWAN TREE (q. v.), and belongs to a different natural order. Its resemblance to the A. is chiefly in its leaves.

The A. has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an A., called Yggdrasil (q. v.). Connected, perhaps, with these traditions is the superstitious belief in A. twigs as a charm against witchcraft and magic.

ASHANTI', or ASHANTEE', a negro kingdom in Western Africa, on the north of the Gold Coast, in lat. 6°—8° N., and long. 0°—3° W. It is mountainous, well watered and healthy, except in the lower alluvial districts. The principal rivers are the Volta and the Assinie. The population is estimated at about a million. The land is extremely fertile, producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pine-apple, and other fine fruits, with gums, dye-woods, and timber. The principal exports are gold-dust and palm-oil, together with slaves. The natives are remarkable for their skill in certain articles of manufacture; their cottons are beautiful, as also their earthenware and sword-blades. The capital is Coomassie (q. v.).

The beginnings of the A. kingdom are obscure, but its traditions point to an emigration some hundreds of years ago from a region north of the Kong Mountains, probably caused by the spread of the Mohammedan empire of Timbuctoo. Our first positive glimpse of it is got in the year 1700, when Coomassie was made the capital by Osai Tootoo I., who conquered Akim, Assin, Gaman, Denkira, and other neighbouring states, and became a sort of feudal sovereign over a large district. In their course of conquest over the Fantees, the Ashantis became involved in war with the British (1807—1826), and were finally driven from the sea-coast. In 1873—1874, in consequence of disputes arising in connection with the cession of the Dutch forts to Britain, they were again involved in a war with the same power; but there is reason to believe that the crushing defeat which they have sustained at the hands of Sir Garnet Wolseley has effectually curbed their aggressiveness. The more intimate knowledge of them thus acquired has confirmed the report that the people are sanguinary in disposition and in their religious ceremonies, but courageous, and of more intelligence than the surrounding tribes. Human sacrifices are said to be very common.

A'SHBOURNE, a small town in a rich district near the left bank of the river Dove, in the west of Derbyshire. It lies on a steep south slope, with high hills on the north. It has a cruciform church, as old as the 13th c., with triplet lancet windows, which was restored in 1845 at the cost of £2000. Pop. in 1871, 2083, chiefly engaged in the cotton, lace, and iron manufacture, and in the cheese and malt trade. At A., in 1644, the parliamentary troops defeated those of Charles I.

A'SHBURTON, LORD (ALEXAN[DER] B[ARING]), born in 1774, a younger son of Sir F[rancis] Bart., was, in early life, for many y[ears] cially engaged in the United Sta[tes] Canadas, in the service of the great l[ondon] cantile house founded by his fath[er] death of the latter, in 1810, he beca[me] of the firm of Baring Brothers & Co., a[nd] was elected M.P. for Taunton. He rep[resented] that place, Callington, and Thetford, on the interest, till 1831, and in 1832 was return[ed] North Essex as a moderate Conservative. In short administration of Sir Robert Peel (18[41]) he was President of the Board of Trade, and [Master] the Mint, and was created Baron A. by [Peel] 1835. This title had been conferred, [in 1782] on the celebrated lawyer, John Dun[ning], married Alexander Baring's aunt, and [became] extinct on the death of his cousin, the second Lord A., in 1823. In 1842, Lord A.'s knowledge [of] ness, and thorough acquaintance with [American] institutions, customs, and modes of thought, him to be appointed special ambassador [to the] United States, to settle the north-west b[oundary] question, and other disputes, that then threa[tened] involve the two countries in war. In Aug[ust] same year, he concluded the famous tre[aty] ington, commonly called the A. Treaty, by [which] frontier line between the state of Maine an[d] was definitively agreed to. By this tre[aty] twelfths of the disputed ground, and [the] settlement of Madawaska, were given to [the] States, and only five-twelfths of the [disputed ground] Britain; but it secured a better militar[y] England, and included heights comma[nding] Lawrence, which the award of the king [of Holland], who had been chosen arbiter, had as[signed] Americans. By the 8th and 9th articl[es] are made for putting an end to the Afri[can] trade; and the tenth article provides for extradition of suspected criminals. Lord A. free-trade, but strongly supported the pe[el] system when first proposed by Rowla[nd] 1837. He formed a valuable collection paintings. His death took place M[arch] 13. His eldest son, William Bingham [Baring], Lord A. of this creation, born in 1[799] at Oriel College, Oxford, entered [Parliament] as member for Taunton, and in [1835] appointed Secretary to [the Admiralty]. February 1845 he became [First Lord] Forces, and Treasurer of the

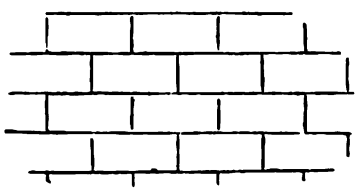
[illegible] town on the west of the confluence of the two upper branches of the river Stour, near the middle of Kent. Pop. in 1871, 8458, which has largely increased from its having become the junction station of three great lines of railway. Damask is manufactured here.

A'SHLAR, or A'SHLER, building-stone squared and hewn, as distinguished from rubble, or rough stones which are used as they come from the quarry without being dressed. A. is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone



Ashlar.

which is to form the facing of the wall. Thus, there are *tooled* A.—the marks of the tooling being either *random* or in *grooves; polished* A., in which the face of the stone is rubbed smooth; and *rustic* A., in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term A. to squared stones before being hewn. In old documents, the term appears under a variety of forms, such as achlere, ashelar, aslure, and estlar.

ASHLEY, LORD. See SHAFTESBURY.

ASHMOLE, ELIAS, a celebrated antiquary, was born at Lichfield on the 23d May 1617. In 1633, when only sixteen years of age, he commenced the study of law, and five years after, he was admitted to practice as a solicitor in Chancery. During the civil wars, he embraced the side of the Royalists, and was appointed captain in Lord Ashley's regiment, and comptroller of the Ordnance; but at the same time exhibited his love of study by joining Brazenose College, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, and astrology. In 1646, he became acquainted with several famous astrologers; amongst others, William Lilly, whose conversation had a great charm for him; and in 1650, he published a work of Dr Dee's, to which he subjoined a treatise of his own. Continuing with singular perseverance his researches in this dim region of superstitious philosophy, he was enabled, in the course of two or three years, to issue his *Theatrum Chymicum Britannicum*, which procured for him a high reputation, and the friendship even of men like John Selden. In 1658, appeared his *Way to Bliss*, a work on the philosopher's stone—the last he published in connection with astrology. At the restoration of King Charles various honours and emoluments were conferred upon him. In 1682, he presented to the university of Oxford a very fine collection of rarities, which properly, however, belonged to certain persons of the name of Tradescant. In this transaction he exhibited a rather mean ambition to exclude the rightful owners of the cabinet of curiosities from participating in the honour of the gift, and posterity has unfortunately gratified his wish by calling it the Ashmolean Museum. He died May 18, 1692, leaving behind him a large quantity of manuscript, a considerable portion of which has since been published.

ASHMUN, JEHUDI, an American philanthropist, was born at Champlain, in the state of New York, in 1794. He was educated with a view to the Christian ministry; but eventually became editor,

in Washington, of a monthly magazine called *The Repertory*. In this periodical he advocated the views of the African Colonisation Society for founding a colony of liberated negroes on the west coast of Africa. In 1821 he published a life of the Rev. Samuel Bacon, who had fallen a victim to an unsuccessful attempt to realise these views in the previous year. Learning the difficulties which surrounded a second attempt at planting a settlement in Africa, A. resolved to devote himself to the good work. Receiving an appointment as one of the agents of the African Colonisation Society, he conducted a body of liberated negroes from Baltimore, and landed at Cape Mesurado, the seat of the infant colony, in the autumn of 1822. Dr Ayres and the other agents of the Society having meanwhile abandoned the settlement from severe illness, he assumed the superintendence of affairs as the sole representative of that body. Here, for more than six years, he devoted his powers and his life to the establishing, on a fair and solid basis, this colony, so full of hope for the American negro. He shewed great courage and tact in opposing the united forces of the natives at the outset of his management, and no less ability in after-negotiations with the chiefs, by which the colony acquired very considerable accessions to its territory. His health at length becoming sadly impaired, he bade adieu to the settlement, then recently called Liberia, in March 1828, and landed at Newhaven, Connecticut, in a state of great exhaustion. After a brief revival, he relapsed, and died on the 28th August 1828, in his thirty-fifth year. His remains were honoured with a public funeral. A memoir of his life, by R. R. Gurley, appeared at Washington in 1835.

A'SHTAROTH. See ASTARTE.

A'SHTON-IN-MAKERFIELD, a small township in a carboniferous district, in the Middle of South Lancashire. Pop. in 1871, 7463, chiefly engaged in collieries, and in the cotton manufacture.

A'SHTON-UNDER-LINE, a town in the south-east of Lancashire. Pop. in 1871, 37,389. It returns one member to parliament. It is a great seat of the cotton manufacture. The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, &c. To the west of the town is a large moss or shaking bog, containing fir-trees full of turpentine, and black oak, with a loamy bottom at the depth of 10 feet.

ASH-WEDNESDAY, the first day of Lent (q. v.), so called from the Roman Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590—604), was sanctioned by Pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes were consecrated on the altar, sprinkled with holy water, and signed three times with the cross, while the priest recited the words, *Memento quod cinis es, et in cinerem reverteris!* ('Remember that thou art dust, and must return to dust!') Next, they were strewed on the heads of the officiating priests, the clergy, and the assembled people. The ashes were said to be those of the palms consecrated on the preceding Palm Sunday (q. v.)—The Protestant Church in Germany does not celebrate A. In the Church of England, it is observed by the stricter members, but without anything of the ceremony from which it derives its name; and the *commination*—a series of denunciations against impenitent offenders—is appointed to be read in the service for this day.

A'SIA, the largest division of land on the globe, generally regarded as the birthplace of the human race, and the most ancient seat of civilisation. Its superficial area, including islands, has been estimated at from 16 to 20,000,000 square miles, and its population at 650,000,000. This enormous mass of continent lies almost entirely in the northern division of the eastern hemisphere, while its world of islands extends across the equator on the south-east. On three sides, it is surrounded by the ocean; but on the west, is partially connected with Africa and Europe. The continental mass is more than four times as large as Europe. Some idea may be formed of its vast extent by the calculation that, though it contains more than half of the whole population of the globe, the number of its inhabitants is so small compared with its area, that Europe may be said to be three times more densely populated. The coast-line is about 33,000 miles in length; and on the south and east, is diversified by seas, bays, and gulfs, affording advantages to navigation and commerce far superior to those of Africa, but inferior to those possessed by Europe and America. On the west side, the Dardanelles and the Sea of Marmora may be regarded as but a slight interruption of the great table-lands of Europe and A. which form the continent of the old world.

Horizontal Configuration.—A. is bounded N. by the Arctic Ocean; E., by the Pacific Ocean; S., by the Indian Ocean; and on the W., by Europe, the Black Sea, Archipelago, Mediterranean, and the Red Sea. On the extreme north-east, the peninsular land of Kamstchatka is separated from North America only by the narrow Behring's Strait. On the south-east, a bridge of numerous islands—Sumatra, Java, Borneo, Papua, &c.—extends towards Australia. The body of the continent may be regarded as a trapezium, of which the offsets, consisting of several large peninsulas, bear some resemblance to those of Europe; though in A. everything is on a more gigantic scale. Thus, one of these offsets, the peninsula of Arabia, is four times as large as France. On the west extends the peninsula of A. Minor, or Anatolia, divided from Europe by the Strait of Constantinople, the Sea of Marmora, and the Dardanelles, with the Black Sea on the north, and the Levant on the south. On the south of A., the peninsular configuration may be divided into three principal masses, corresponding to the southern coast of Europe: Arabia may be considered as a counterpart to Spain; Italy, with its neighbour-island, Sicily, is represented by Hindustan and Ceylon; and, as in Europe, the broken Grecian peninsula is connected with A. by a bridge of numerous islands extending on the south-east, so, in A., the Eastern Peninsula (or India beyond the Ganges), lying between the Bay of Bengal and the Chinese Sea, is connected with Australia on the south-east by the vast Eastern Archipelago. This world of islands is divided into the several groups of the Philippine Islands, Borneo, Celebes, Moluccas Islands, Sumatra and Java, Timor and the numerous adjoining isles. The east coast of A. is characterised by the deep indentations of the Pacific Ocean in the Chinese Sea, Yellow Sea, and Seas of Japan, Okhotsk, and Kamstchatka; all fringed with numerous islands, and separated by the peninsula of Corea, the island of Saghalien, and the peninsula of Kamstchatka. On the north, the Siberian coasts are also deeply indented; but rather by the embouchures of large rivers than by arms of the sea. The whole length of continental A., from the Dardanelles to the Japan Islands, is 6000 miles; its breadth, from Malacca to the north-east cape of Siberia, is 5300 miles; with its islands it extends from 10° S. lat. to 78° N., and from 26° E. long. to 190° E. or 170° W. Such an extent of surface must include all varieties of soil, climate, and production.

rtical Configuration.—Equally grand are the
res of this continent when regarded vertically:
s the most extensive lowlands, the most immense
-lands, the highest chains of mountains, and the
elevated summits in the world; tracts doomed
erlasting snow or scorching sterility, salubrious
ys of continual verdure, and noisome jungles of
ankest growth. The table-lands of Asia occupy
rs of the whole continent. The eastern
r is 2000 miles broad; the western, less than
. The whole mass may be regarded as consist-
of two parts, separated, or, to speak more
erly, perhaps, connected by the lofty, snow-
red mountain-isthmus of the Hindu Kush. These
t divisions are styled respectively: 1. The
ern Plateau, including the Table-land of Tibet
the Desert of Gobi; 2. The Western Plateau,
Table-land of Iran. The former, a vast four-
l mass, considerably larger than the whole area
Europe, extends 2800 miles from the mountain
s, Hindu Kush, to the Tonquin Gulf in China.
the south, the plateau is divided from the plains
Hindustan by the Himalaya Mountains, which
a mean height of 18,000 feet, while several of
r summits rise from 25,000 to 29,000 feet above
level of the sea. Even the passes over this
ss range of mountains are almost as high as
mit of Mont Blanc. Here Dhwalagiri, long
med to be the Mont Blanc of the Himalayas,
with precisely the same signification, viz., 'white
ntain,' rising to 26,826 feet, leaves all the peaks
the Andes far below; while Kunchinjinga reaches
3,156 feet, and Deolunga, now believed to be
highest summit in the world, attains the height
feet. Cultivation is found at 10,000 feet
ve sea; while flocks graze some 4000 feet
er. In Eastern Tatary and Tibet, the ground is
vated at a height only 2000 feet lower than the
t of Mont Blanc. On the east, the table-land
west is bounded by the Chinese mountain-ranges
ling and Khing-khan, which, towards the south,
connected with wild Chinese alpine regions of
h little is known; while, towards the north, they
d into another mountainous region, where the
ra chain of Shangpe-shan opposes to the
ic Ocean a wall of rock 3000 feet high. On
north, the chain of the Altai Mountains, 3000
long, and divided into several groups, forms
boundary between the great plateau and the
of Siberia, which is larger than the whole area
rope.

e Western Plateau, or Table-land of Iran, rises
rally about 5000 feet above the sea; but in some
to 7000 feet; descending again, however, in the
al and southern parts, where it spreads out into
y and gravelly plains, to 2000 and 1200 feet. It
seen divided into three sections: the Plateau of
proper; the Median-Armenian Alpine region;
the Anatolian Table-land. The *first* division,
e Plateau of Iran, has a mean altitude of about
feet. Salt plains, with gravel and sand, form
portions of the surface, and mountain-walls on
des hem it in. On the northern edge ascend the
an mountains; on the east, the steep and lofty
lel chains of the Indo Persian boundary moun-
; and on the south, the plateau, for 1000 miles
g the Persian Gulf and Arabian Sea, is bounded
the wild terraced regions of Beloochistan and
stan. The *second* division, or the Median-
nian Alpine region, includes the mountainous
ns of Armenia, Kurdistan, and Azerbijan.
the table-land is compressed to about half its
ral width. From this plateau, of which a part
tioned in Scripture as 'the mountains of
,' rises the volcanic cone commonly styled
Ararat, to the height of 17,212 feet above
the sea-level. Anatolia, the *third* and most westerly division of the table-land, is bounded along the shores of the Black Sea by mountains rising to 6000 or 7000 feet, and partly covered with forests; on the south-west, the Taurus chain of mountains, beginning in the islands of Rhodes, Cos, &c., extends in several ramifications through a part of Asia Minor, runs in a single range along the coast of Karamania, and in the east has an occasional height of 12,000 and 13,000 feet.

The Western Plateau, thus divided into three sections, is full of diversities of soil and scenery. A great part of the table-land of Iran (or Persia) is extremely barren and arid, which serves to explain the enthusiastic terms in which the Persian poets have spoken of the beautiful valleys found here and there among the mountains. The coasts of the Persian Gulf are sandy wastes. Between Irak and Khorassan, a desert of clay, covered with salt and nitre, varied only by patches of verdure here and there, occupies 27,000 square miles, and joins the wide sandy desert of Kerman. A great part of Beloochistan is an arid plain, covered with red sand.

Besides these central masses, there are several detached mountain chains and plateaus. The Ural Mountains, forming the land-boundary between Europe and Asia, and separated from the Altai chain by salt lakes, marshes, and deserts, is divided into three sections: the Northern, Central, and Southern Ural. The second of these divisions is rich in minerals—gold, platina, magnetic iron, and copper. On the isthmus between the Black Sea and the Caspian, the alpine ridges of the Caucasus reach a height of from 10,000 to 11,000 feet, while individual peaks tower up to the gigantic height of 17,000 or 18,000 feet, as, for instance, the still faintly volcanic peak of Elbrus, the exact elevation of which is 18,493 feet, and Mount Kasbeck, 16,523 feet. The high lands of Syria rise gradually from the neighbouring deserts to the height of 10,000 feet in Libanus and Anti-libanus, and slope steeply in terraces down to the narrow coast-lands of Phœnicia and Palestine. The plateau of the Deccan, in India, rises to an average height of from 1500 to 2000 feet, and is divided on the west from the narrow coast-level of Malabar by the Western Ghauts, 4700 feet; on the east, from the broad level coast of Coromandel, by the Eastern Ghauts. On the north, it is divided from the low plains of Hindustan by the Vindhya and Malwah mountain-chains; and, on the south, the Ghauts unite at the sources of the Cavery, and form the Neilgherry (or Blue Mountains, 8760 feet high), the loftiest in the peninsular portion of Hindustan. These slope steeply down to a low narrow plain, then rise again to a considerable height in the Alagherry range, sink into the sea at Cape Comorin, and reappear in the group of Adam's Peak in Ceylon. The Malayan Mountains, or chains of the Eastern Peninsula, may be regarded as offsets of the Sine-shan, and extend to the extreme south point of A., reappearing with volcanic peaks in the Sunda Islands.

The six great *Lowlands* of A. are, 1st, The *Siberian* lowland in the north, which is by far the largest. It stretches from the northern declivities of the Altai and Ural Mountains to the shores of the Arctic Sea, and is, for the most part, cold, gloomy, and barren. 2d, The *Bucharian* lowland, or the wild sterile waste between the Caspian Sea and Lake Aral, much of it beneath the level of the sea. It is composed to a large extent of gravelly soil. 3d, The *Syrian and Arabian* lowland, the south of which is hot and arid, with almost no oases; but the north is watered by the Tigris and Euphrates. 4th, The lowlands of

Hindustan, comprising the great Indian desert, 400 miles broad, together with the vast and fertile plains of Bengal, generally called the Valley of the Ganges, and ranking, perhaps, next to China as a region of fertility. 5th, The *Indo-Chinese* lowlands, comprising the long levels of the Burman empire, through which flows the Irrawady, and the rich regions of Cambodia and Siam. 6th, The *Chinese* lowlands, commencing in the east at Pekin, and extending as far south as the Tropic of Cancer, containing 210,000 square miles, or an area seven times the size of Lombardy. It is watered by a copious river-system and numerous canals, and may be regarded as a vast garden, exceeding in productiveness all other parts of the world.

Hydrography.—The hydrography of A. displays as striking a variety as the structure of its land. The alpine regions send down in some directions torrents of water, which form rivers almost rivalling in magnificence those of America, and which flow for hundreds of miles through plains of unsurpassed fertility. On the other hand, there are wide stretching tracts, like the deserts of Africa, destitute of water, and doomed to eternal sterility. Only one large sheet of water, Lake Hamoon or Seistan (q. v.), refreshes the high table-land of Iran. The low steppe of Turan contains the Caspian Sea (q. v.), the largest of all lakes, and Lake Aral (q. v.). In the valley of Cashmere lies Lake Ular, 40 miles in circumference, and the only considerable sheet of water in the Himalaya chain. At the northern base of this mountain-chain, Lake Palte is remarkable for its annular form. In Tibet and the Altai Mountains, lakes are very numerous.

One of the most striking characteristics of Asian river-systems is found in its double rivers, or two streams rising in the same region, flowing in almost parallel directions, and either uniting, or nearly so, before entering the sea. Among these twin rivers may be mentioned—the Sihon and Gihon, flowing into Lake Aral; the Euphrates and Tigris, in Western A., surrounding the plain of Mesopotamia, uniting at Koona, and together flowing into the Persian Gulf; the Ganges and Brahmaputra; and the Yang-tze-kiang and Hoang-ho, in China, rising near each other, then widely separated in their courses, but again approaching each other, and both falling into the Yellow Sea, only 100 miles apart.

The six great river-systems of A., comprising rivers which will be found fully noticed under their respective names, are—the Mesopotamian, that of North-west India, that of North-east India and Tibet, the Indo-Chinese, the Chinese, and the Siberian. The *first* comprises the two famous streams, the Tigris and Euphrates. The *second* comprises the Indus with its tributaries. The *third* system comprises the Brahmaputra and Ganges. The *fourth* system comprises the rivers of the Indo-Chinese peninsula; the chief of which are the Irrawaddy, the Martaban or Saluen, the Me-nam, and the Me-king or Cambodia. The *fifth* system is the Chinese. It comprises four great streams, all of which flow in an eastern or north-eastern direction into the Pacific: the Hong-kiang, or Canton River; the Yang-tze-kiang (or Son of the Sea); the Hoang-ho, or Yellow River; and the Amur. The *sixth* system comprises the large rivers of Siberia, the principal of which are the Obi, the Yenisei, and the Lena. They all have their sources in the Altaian Mountains; flow north, or nearly so; and for 800 or 900 miles before their embouchure, traverse a dreary, flat, monotonous waste, until their sluggish waters creep into the Frozen Sea.

Geology.—The geological structure of Asia is so complex, the different formations are so broken up and scattered, that a general description would be unintelligible. We must refer to separate notices, where the geological structure and phen circumscribed districts will be given in d the reader will, in this way, be enabled correct impression of the geology of Asia See HIMALAYA, HINDUSTAN, CHINA, S

Natural History.—The vast extent great diversities of climate, natu expect in it a great variety of nat both animal and vegetable. This heightened when we consider how vast continent is divided into separate p mountain ranges of great altitude, and h sive the mountainous tracts themselves a as the great extent of the elevated plate lands, and when we add to these consid of the peculiar character of wide reg sand—level steppes—and extensive d the soil is strongly impregnated with ingly, we find, both in the flora and fa the variety which such considerations mig to expect.

The most northerly part of the continent, differs comparatively little in its product the corresponding parts of Europe and A exhibits the same arctic flora, with diffe ratively inconsiderable. Pines, birch form, as in the other continents, the the north; but upon account of the climate, they do not reach a limit so north Europe, and particularly in the west o Some of the common plants of Europe are as far east as Kamstchatka: the Crowber *trum nigrum*), so plentiful in the moors of is still more plentiful throughout Siberia; *Vaccinia* (Bilberries, &c.) and *Rubi* (Bran abound in the Kamstchatkan forests as in Scandinavia. There are, however, inter ferences. Heaths are comparatively rare flora agreeing in this respect with that of rather than with that of Europe. The lar in Europe occurs only on the central a extends far northward at the mouth of t the utmost limits of arborescent vegetation; a mere variety of the same species, althou been described as distinct. In Kamstchat ferent kind of birch replaces the common Europe as a forest tree, and the Siberian is different from that of the south of Europ in its less frigid regions produces a luxuria tion, of which herbaceous plants of unusu size for a cold or temperate climate are teristic feature; as species of Rhubarb, and Cow-parsnip (*Heracleum*), some of now well known in Britain. It is indeed central and eastern temperate parts of A cultivated species of rhubarb are derive the same region the rhubarb root, so medicine, is brought. In the abundance *lariaceæ* (Currants), the warmer parts resemble North America, although mos species are different.

To the south of the Altaian Mountains of Asia corresponds in part with that of eastern plain of Europe; but it exhibits liarities which may in some measure be a the saline character of large districts, the sandy desolation of others, and the elevat great central plateau. The flora of Asia of Syria has a general resemblance to south of Europe, although exhibiting als which belong rather to that of India or Shrubby *Labiatæ* are particularly c this region, from which not a few found their way into the gardens of E other parts of the world, upon acco fragrance, their medicinal qualities,

European Alps; forests of pines appear, and along with them the *deodar*, a cedar scarcely, if at all different from the cedar of Lebanon. The mountains of Java also produce oaks and other trees resembling those of the temperate zone, although the species are peculiar. But many parts of A. have as yet been very imperfectly explored.

Many of the cultivated plants of Europe are known to be natives of A., and others are supposed to be so. As the cradle of the human race, and the scene of the earliest civilisation, it is natural to suppose that it supplied the first fruits and other vegetable productions which man sought to improve by cultivation; and of some which, as the apple and the cherry, are probably natives of Europe, it seems probable that the first improved varieties were introduced from A. We do not know with certainty of what part of the earth some of the principal cereal plants or grains are natives—as wheat, barley, oats, and rye; but there seems great probability in the supposition that they are of Asiatic origin. Rice certainly is. It has been cultivated from time immemorial in some of the warm parts of A.; and its introduction into other quarters of the world is comparatively recent. Maize—introduced from America—is now to be reckoned among the most important cultivated plants of A., and its cultivation is rapidly extending, as is that of the potato. Wheat, oats, barley, rye, beans, pease, and buckwheat, are the principal crops of regions similar in climate to those in which they are cultivated in Europe. Barley and buckwheat are cultivated in the Himalayas at the extraordinary elevation of almost 12,000 feet, and crops of barley are to be seen even at 15,000 feet above the sea. Millet of different kinds, durra, and other grains of inferior importance, are cultivated to some extent in India and other warm regions; also different kinds of pulse. The banana and plantain are of the same importance as in other tropical countries; and the yam and coco or eddoes contribute largely to the supply of human food. The sugar-cane is cultivated in the warm parts of A., but not with so much spirit or success as in America, although it is a native of the East and not of the West Indies. Pepper is one of the native productions of the East Indies, and is extensively cultivated. Tobacco, whether or not any species of it is indigenous to A., is now produced in large quantities. Indigo is extensively cultivated in India, and the opium poppy too extensively. Different species of cotton are natives of India, and have long been cultivated there and in China. Hemp is cultivated in India, not for its fibre, but to afford the means of intoxication; and flax chiefly for the oil of its seeds; but both hemp and flax are extensively cultivated for their fibres in other parts of A.; and India and the other tropical regions produce many plants valuable for their fibres, among which are species of *Musa*, *Corchorus* (yielding the jute of commerce), and *Urtica* (nettle). Among the crops of India is sesamum, valued for the oil of its seeds.

It seems probable that we are indebted to the warmer temperate parts of A. not only for the orange, the lemon, and all the other species of the genus *Citrus*, but also for the olive, the peach, and nectarine, the apricot, the fig, the mulberry, and the vine, with many other of the fruits now most generally esteemed and cultivated. China and Japan, being the seats of an ancient civilisation, many useful plants have long been cultivated there, which have scarcely yet found their way into other parts of the world. Floriculture has be
there with great assiduity from a
and varieties of Hydrangea, Cam

Chrysanthemum, &c., have, from time immemorial, been scarcely if at all less numerous than those of the tulip and hyacinth in Holland.

The zoology of A. is not less interesting than its botany. Amongst domestic animals, the most important are the ox and buffalo, the sheep, the goat, the horse, the ass, the camel, and the elephant. A number of species of ox and buffalo are natives of A., from more than one of which the domesticated races appear to have derived their origin. Very distinct from all the others is the yak (q. v.) of Tibet, a creature which is of great use to the inhabitants of the elevated regions of the Himalayas, and is to them almost what the reindeer is to the Laplander. The sheep and goat are natives of the mountainous parts of Central A. The horse and the ass seem to belong to the same regions; and all of these have been domesticated from the earliest times. The camel is of incalculable value as a beast of burden in the regions of heat and drought, and as affording the means of traversing the great deserts. It is used principally in the south-west of A. and in India. The elephant is a native of the tropical parts of A., but is of a different species from that of Africa. The reindeer constitutes the chief wealth of some of the tribes of the north. Dogs are also used by some of the Siberian tribes for drawing their sledges. Different races of dogs are domesticated in different parts of A., and a small kind is fattened for its flesh in China; but in the Mohammedan parts of A., the dog is reckoned an unclean animal, and is known chiefly as a prowler about towns and villages, and a devourer of offal.

The tropical parts of A. abound in monkeys, of which the species are very numerous. Among them are some with long, and some with short tails, but none with prehensile tails, like the sapajous of America. Many are altogether tailless, and among these is the orang-outang, found in the south-eastern islands. A much larger ape, called the pongo, has been said to exist in Borneo, but it is still a doubtful species. The same warm regions abound in bats, many of which are of large size, and feed upon fruits, not upon insects. The flying lemur or colugo is another remarkable animal of the Indian Archipelago.—Bears are found in all parts of A.—the white bear in the extreme north, and other formidable species in the more temperate parts; whilst the tropical regions produce bears which are by no means ferocious, and feed chiefly on insects, fruits, and honey. Badgers are also found in A., and quadrupeds of several other plantigrade genera, allied to the bear, but of comparatively small size and inoffensive habits, as the beautiful Panda (*Ailurus*) of the north of India, and the Binturongs (*Ictides*) of Malacca and the neighbouring archipelago.—Animals of the Weasel family (*Mustelidæ*) are numerous, among which the Teledu (*Mydaus meliceps*) of Java rivals the skunks of America in the horrible stench with which it surrounds itself for defence. More important are the sable and the sea otter, pursued in the northern regions upon account of their furs.—Of the Dog family, or *Canidæ*, A. has not only wild dogs, but also wolves, foxes, hyænas, and jackals; the two former abounding chiefly in the colder, the two latter in the warmer regions. The arctic fox inhabits the most northerly shores and islands. The warmer parts of A. produce a number of species of the allied family of the *Viverridæ*, among which are the mangouste or Indian ichneumon—famous, like the Egyptian ichneumon, for the destruction of serpents—and the civet, from which is obtained a celebrated perfume.—Of feline animals, the most dreadful are the lion and tiger; the latter of which is peculiar to A., abounding in the warm regions of and east, never extending westward be mountains and deserts which separate I Persia; but, on the contrary, advan north, beyond the limits to which the and even to the confines of Siberia. the ounce, and many other cats, some o and dangerous, are found in A., esp warmer parts of it. Among them may the chetah, or hunting-leopard, tamed fo in India.—A few small marsupial (or quadrupeds (*Phalangers*) are found in the I and form one of the links by which the history of A. is connected with that of Au The *Glires* or *Rodentia*, on the contrary, are n in all parts of A., and many species to it. Squirrels, marmots, rats, mice, are common in all except the most no The brown rat, now so common in to have emigrated from Persia so re beginning of the 18th c. Lemming Siberia and the Tatarian deserts, of jerboa is also an inhabitant. Porcupines ar in the warmer parts of A., and the beaver in the north.—Of Edentate quadrupeds, golins (*Manis*) alone are Asiatic, and confined to the tropical regions.—Of *Pach* there are, besides the elephant, the ha already mentioned, several species of wild boars, the babyroussa, and a spec all, except the wild boar, natives of climates. One of the most interesting ever, connected with the natural histo the abundance of remains of the mammoth, elephant, in the coldest parts of Siberia, still affording a considerable supply of iv ruminating animals, besides those of the already mentioned, and the sheep and go are deer, antelopes, and musks or musk-de reindeer and elk are natives of Sibe south, the species of deer are much and the same countries produce antelope. The musks are found in the southern parts of the continent; one native of the highest mountains, yielding prized perfume from which it derives its possesses vultures, eagles, and other *Falconi* ravens, and other birds of the crow kind storks, cranes, &c. Swans, geese, ducks of species, and many other *Anatidæ*, frequ waters, some of them abounding even in regions. Albatrosses are very Kamstchatkan shores; flamingoes more southern countries. Pigeons ab among them is the turtle-dove. The Indian Archipelago are birds of the p which one species is almost as larg There are many kinds of thrush, finch, bunting, sparrow, and other birds identi or allied to those of Europe, nightingale, often mentioned by and many also, particularly in which are peculiar and charact be mentioned the splendid p south-eastern islands, peacock, pheasa gallinaceous birds of Asia are numerou this continent were probably derived poultry of other parts of the earth. ance of the parrot tribe constitutes a pe blance between the tropical parts of A tropical countries, but lories are pecu Indies. aces the inhabitants of Northern India,
, Persia, and part of Asiatic Turkey; the
ies the Syrian, Hebrew, and Arabian
(see ETHNOLOGY).

further subdivision and classification may be
as follows: 1. The *East-Asian group*, includ-
peoples of Tibet, China, Japan, Corea,
o-Chinese peninsula; all alike in the
syllabic languages. This last people,
at be subdivided into Western and
former comprising the inhabitants of
empire, Pegu, Laos, and Siam, having
with the Hindus; and the latter, com-
inhabitants of Tonquin, Cochin-China,
media, have affinities with the Mongolians
and China. 2. The *Tatar group*, includ-
Turkomans, Mongols, and Tungusians, who
read over the whole table-land of Central
neighbouring lands in the north. The
amily is divided into three sections—
cluding the east Turkomans, inhabiting
, Khiva, Balkh, and Usbekistan; the
cluding the so-called Tatars of the Urals
neighbourhood of Astrakhan and Kazan;
including the Turks or Osmanli. With
sion of a few small tribes in Siberia,
ish varieties are Mohammedans, use
alphabet, and employ numerous Arabic
their dialects. 3. The *Siberian group*,
Samoiedes, people of Kamtschatka,
, languages which have only recently
ed by philologists. 4. The *Malay-Poly-*
, mixed with Australasian negritos, are
over all the islands of Polynesia and the
Archipelago. The Malayan people of Java,
, Celebes, the peninsula of Malacca, the
slands, Moluccas, and Philippines, have
literature, which has been formed
and (since the 16th c.) under Euro-
. The South Sea islanders are clearly
two races by physical form, colour,
One race is allied to the Australasian
negrito, and the other to the Malayan. In most of the islands, there is a partial intermixture of the two races, but generally the distinction is obvious. It is probable that all the copper-coloured Polynesians belong to the same family with the people of the Indian Archipelago. 5. The *Deccan group*, including all the people employing the Tamul, Carnatic, Telugu, and Singalese languages, all having a certain measure of civilisation and a literature. 6. The *Indo-Germanic* or *Aryan group*, marked and subdivided by the three languages, Sanscrit, Persian, and Armenian. About thirty distinct nations, each having a peculiar dialect and literature, belong to the first subdivision; the second includes the peoples of Beloochistan, Afghanistan, Persia, and Kurdistan; the third, the Armenians. All these families have literatures partly written in dead languages—the Sanscrit, Pali, Zend, and old Armenian. 7. The heterogeneous tribes inhabiting the Caucasus, whose affinities are not yet settled. 8. The *Semitic group*, including all the peoples whose languages are related to the Hebrew and Arabic.

Religions. The same Asian characteristic of variety and wide contrast is found in the creeds as in the countries and tribes of people: the Brahminical religion of India; the doctrines of Buddha, Confucius, and Laotse in China; the worship of the Grand Lama in Tibet; the creed of Islam in several varieties in Arabia, Persia, and India; the rude heathenism of the north; the various sects of native Christians in Armenia, Syria, Kurdistan, and India; the Greek Church in Siberia; these and other forms of faith or religious profession display diversities and contrasts nearly as striking as those of Asian geography. Christianity, now the religion of Europe and America, owes its origin to Asia. For an account of the existing religious systems of Asia, see articles MOHAMMEDANISM, INDIA (*Religion*), BUDDHISM, LAMAISM, &c.

Civilisation. The number of people civilised—in the Asiatic sense of the word—is far greater than that of wild and nomadic hordes; but culture here, when arrived at a certain point, assumes a stationary character, widely differing from the restless intellectual activity and industrial progress of Europe. The laws of states, families, industry, commerce, art, and science are, in India and China, so many branches of one fixed and permanent religious system, which has maintained its sway through many centuries, and would long remain unchanged, if left undisturbed by European influence. The Arabs, Persians, and Turks, collectively known as the Easterns, are distinct in civilisation from the Hindus and Chinese. The institution of slavery among the former, of *caste* among the Hindus, and the civil and political equality of China, are distinguishing marks. The Turk is a monotheist and fatalist; the Hindu is either a mystical pantheist or polytheist, acknowledging a multitude of gods; the Chinese is rather a utilitarian moralist.

Industry. The industry and commerce of the Asiatic continent bear no adequate proportion to its capabilities—such as they are, they will be described under the different countries.

Political Aspect. The political institutions of A. present to us some striking contrasts. While the barbarous hordes in the north live almost without the idea of government, and scarcely know that the Russian czar claims them as his subjects; and the nomadic tribes, under their khans or sheiks, have a sort of patriarchal government, subordinate to higher powers; the most extreme forms of monarchy and despotism have existed among the more cultivated nations. The government of China is an absolute monarchy in form, but, in fact, is strictly limited by the force of tradition. The emperor is apparently

unlimited in authority; but it is an essential duty of an emperor to rule exactly according to the precepts handed down by his ancestors. Reverence for ancestors and their institutions is, therefore, the sole presiding and conservative principle which has so long preserved the great Chinese empire from political changes. A., now so passive, anciently took an active part in the great movements of the world's history; contended against Egypt and Greece, and afterwards contributed to the greatness and glory of the Macedonian and Roman empires. From the north of the Caspian Sea, came the vast hordes of the Huns who spread themselves abroad over Europe. The armies of Genghis Khan and Tamerlane overran the Slavonian plains, while the Arab califs, with their fanatical troops, established their religion and government in three quarters of the world. Under the Osmanli fell the eastern Roman empire, and still the Turk maintains a political position in Europe, but one now becoming very feeble and insecure. In proportion as Europe has advanced, A. has declined in political power, so as to countenance the theory of a gradual movement of the spirit of civilisation and progress from the eastern to the western world. It would appear that all great future changes in the destinies of Asiatic nations must proceed from European influence. The Portuguese, Spaniards, Dutch, and French have acquired possessions in India, but all are now insignificant when compared with the vast territory under British government. The following table, from the latest authorities from 1869 to 1872, gives the existing political divisions, with their extent and population as nearly as possible:

State.	Square Miles.	Population.
Arabia,	1,026,040	4,000,000
China Proper, including the islands of Formosa, Hainan, Loo Choo,	1,400,060	450,000,000
Chinese Empire, assumed Dependencies of Tibet, Mongolia, Mantchuria, Korea,	3,300,000	27,500,000
Japan,	149,399	35,000,000

A'SIA MI'NOR, the ancient name of what is now called Anatolia (q.v.). Here, in Ionia, was the early seat of Grecian civilisation, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, &c., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 years B.C.), to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates the Parthians; of the Arabs, Seljuks, Mongols, Osmans with the weak Byzantine empire. It here that Alexander the Great and the successively contended for the mastery of lised world. But, notwithstanding the country still continued to enjoy prosperity till it fell into the hands under whose military despotism has been sadly brought [illegible]

ASKEW, or ASCOUGH, ANNE, ferers for Protestant opinions at Reformation in England. Having views of the reformers, she was turned [illegible] by her husband, a gentleman of Lincolnshire, a zealous Roman Catholic. On this she went to London to sue for a separation; but was eventually arrested on a charge of heresy, and examined by the Bishop of London and [illegible] the doctrine of transubstantiation, the which she denied. After further ex torture by the rack, she was burned at Smithfield, July 16, 1546.

ASMANNSHAU'SEN, a village in the position of Rüdesheim, Nassau, is famed for which is produced on the slate-m vicinity. Of this there are two k white, the former of which is greatly has a rich red colour, like Burgundy. rare aromatic flavour, and is noted for

nd fire. But it retains its excellent nly about three or four years; after r by year, it becomes weaker, and loses The choicest sort, which is preferred by s to all the other red wines of the Rhine, o Burgundy itself, is cultivated in the ards at Wiesbaden.

EUS (properly, ASCHMEDAI, 'the de- n evil genius or demon mentioned in the writings. A. was described as the any evils. In the Book of Tobit (q. v.), nted as slaying the seven husbands of ence, in modern times, has been jocularly s the destroying demon of matrimonial In the Talmud, A. is described as the demons, and is said to have driven m his kingdom.

ÆANS. See MACCABEES.

pis), a venomous serpent, the name of come down from ancient times; the iptions of ancient authors, however, ertainty as to the species. It is very pposed to be the *Naja Haje*, the El Haje aher of the Arabs, which is very common Cyprus, &c., and often appears in hiero- d r sculptures as one of the sacred t Egypt. It is sometimes from length, of nearly equal thickness a gradually tapering tail; brown- dark and pale spots; the scales of and upper surface of the tail slightly the tail about one-fourth of the whole he animal. The neck is capable of con- latation, through the distension of its loose

Naja Haje.

ugh not so much as that of the nearly a da capello of India (*Naja tripudians*). tion of the neck takes place when the is ted. The jugglers of Egypt are m tricks with this serpent, as cobra da capello, causing it ; after they have first, how- ed the poison-fangs. It is eral varieties exist at the Cape of which is nearly white; and one is called Spuugh Slang, or Spitting Snake, by the colonists, from its supposed power of ejecting its poison to a distance when irritated; the poison which distils from the fangs in such circumstances being probably carried off by the forcible expirations which the creature makes—a characteristic, however, not exclusively belonging to a particular variety.—Other serpents of the same family, *Viperidæ*, are by some believed to be the true asp, particularly *Vipera Echis* and *V. Cerastes*. The former is of a grayish or yellowish brown colour, with rays and eye-like spots on the upper parts: it is found both in India and the north of Africa. The latter is of a grayish colour, and has a very broad heart-shaped head, a short obtuse rounded muzzle, and the superciliary or eyebrow scales remarkably developed, so that one of them is often produced into a sort of spine: it inhabits the deserts of Northern Africa.—The name asp is now generally given to *Vipera Aspis*, a native of the Alps, found also in the south-east of Europe and in Sicily, which much resembles the common viper, but is more slender, and has a larger head; it is also more venomous.

ASPARAGUS, a genus of plants of the natural order *Liliaceæ*, having an almost bell-shaped six-partite perianth upon an articulated stalk, six stamens, one style, with three recurved stigmas, and the cells of the berry two-seeded. The species of this genus are herbaceous or shrubby plants, natives chiefly of the south of Europe and of Africa, with abortively dioecious flowers; the stem is unarmed in some, in others thorny; at its first sprouting leafless, and covered with scales at the top; afterwards very much branched, with numerous fasciculate, generally bristle-like leaves. The most widely diffused species is the Common A., *A. officinalis*, a native of Europe, which grows on the banks of rivers and on the sea-shore, in meadows and bushy places, especially in sandy soils, occurring in a few places in Britain, and is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, forming a much esteemed article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance, called *Asparagine*, and have a specific action on the urinary organs, so that their long continued use in very large quantities is apt even to produce bloody urine. They are no longer retained in the pharmacopœia, but both the shoots and the roots of A. are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes, the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of A. are most esteemed for the table. It is one of those plants which have been much increased in size, and considerably altered in general appearance, by cultivation, being seldom more than a foot high in its wild state, and not much thicker than a goose-quill, whereas it has been obtained in gardens more than half an inch in diameter, and its stems rise to the height of four or five feet. It was a favourite vegetable of the ancient Romans. It is generally planted in rows, at distances varying from 1 foot to 2½ feet. Litter or vegetable mould is spread over it in autumn. It is allowed to occupy the same ground for many years, and the shoots are not gathered for use till the plants are four years old. Some of the growers of A. for the London market have 100 acres under this crop.—The seeds have been used as a substitute for coffee, and are recommended for that use upon the continent, even at the

present day. A kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*,

Asparagus.
a, a young shoot; *b*, flowers; *c*, the upper end of a stem, shewing branches, leaves, and fruit (all reduced).

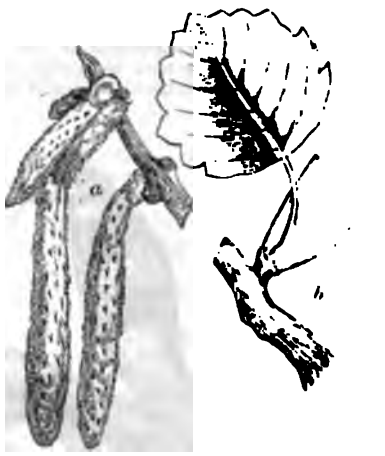
A. acutifolius, and *A. albus*, natives of the south of Europe; the last of which is much used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the Bitter A., *A. scaber*, which is very similar to the Common A., are uneatable, on account of their great bitterness.

ASPA'RAGUS STONE. See APATITE.

ASPA'SIA, one of the most remarkable women of antiquity, was the daughter of Axiochus, and born at Miletus. The circumstance that in Athens all foreign women, whatever their character, were equally esteemed, or rather disesteemed, and that their children, even when begotten in wedlock, were held illegitimate, has originated the erroneous notion that A. was a courtesan. She certainly broke through the restraint which confined Athenian matrons to the seclusion of their own homes; for after her union with Pericles, who had parted from his first wife by her own consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her eloquence and knowledge of politics were extraordinarily great. Her husband—though, strictly speaking, the Athenian law would have refused this appellation to Pericles—was honoured with the title of Olympian Jove, while she herself was dignified with the name of Juno. From the comic writers and others, she received much injustice. It was Hermippus, the comic poet, who took advantage of a temporary irritation of the Athenians against Pericles, to accuse A. of impiety; but the eloquence of the great statesman disarmed the enmity of the judges, and procured her acquittal. Her influence over Pericles must have been singularly great, although this has obviously been exaggerated, and even caricatured. The brilliant but not historically accurate Aristophanes charges her with the origin both of the Samian and Peloponnesian war, the latter on account of the robbery of a favourite maid who belonged to her. Plutarch vindicates her against such accusations; and Thucydides, who details minutely the causes of the Peloponnesian war, does not once mention her name in connection with these. A[fter] the death of Pericles, A. married Lysicles, a cattle dealer (an important, lucrative, and dignified profession in ancient times), who, through her influence soon became an eminent man in Athens. The [fame] of A. was, after her death, applied to many women of remarkable accomplishments and amiability.

A'SPECTS, in Astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five Aspects—Conjunction (indicated by the symbol ☌), Sextile (⚹), Quartile (□), Trine (△), Opposition (☍). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90°; trine when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these A. great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*.

A'SPEN, or TREMULOUS POPLAR (*Populus tremula*, see POPLAR), a tree which grows plentifully in Europe and in Siberia. It is a native of Britain and is frequent in Scotland, where it [grows] at an elevation of 1500 feet above the [sea]. It received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen-leaf has become



Aspen (*Populus tremula*), reduced.
a, a portion of a branch with catkins; *b*, do., with leaves

proverbial. The leaves are nearly or [quite] broadly toothed, so as almost to exhibit [a] footstalks are compressed, which favours [the] ness of motion. It grows quickly, with a [tall] stem, reaching to a height of from 60 to 100 feet. In unfavourable situations, as [on] dwarfish. The wood is soft, porous, light, and smooth; it does not make good fuel, but is fit for the turning-lathe, and especially for being made into troughs, trays, pails, &c. It is also excellent for arrows. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and is then capable of being used as timber for the interior of houses; and on account the tree is of great importance in many districts, and the more so as it succeeds in any [soil] although it prefers one which is moist and [rich]. The bark contains a great quantity of a bitter [principle], *Salicin*. The charcoal made from [it] be used in the manufacture of gunpowder.

similar species, a native of North
alled the American A. It is re-
as a mere variety. Very similar,
North American species, *P. grandi-*

I'LLUM, a remarkable genus of Lamel-
Conchiferous Mollusca, in which the
shell has the form of an elongated
cone, terminating at the larger
end in a disk, which is pierced
with numerous small tubular holes,
the little tubes of the outer range
being largest, and forming a sort
of ray around it. The animals of
this genus are borers, some of
them living in sand, others bur-
rowing in stone, wood, or thick
shells. *A. Javanum* is popularly
called the Watering-pot, and the
same resemblance has suggested
the name A. (from the Latin
aspergo, to sprinkle). The most
interesting circumstance in the
structure of the shelly tube of A.
is the presence of two small
valves, incorporated in the sub-
stance of the tube, to which they
bear a very small proportion.
'They there form the stamp,' says
Owen, 'of its true affinities, but
as little any ordinary final purpose as the
in the gums of the foetal whale.' The
with mollusca inhabiting bivalve shells.
ntary bivalve shell is found, in like manner,
into the shelly tube of the fossil *Teredina*,
ored the drift-wood of the London clay.
is also a genus ASPERGILLUS in Botany,
ing many of the small fungi commonly known
name of Mould (q. v.), which occur on decay-
stances of various kinds. Some of the species
liar to diseased animal tissues.

'ERN, or GROSS A'SPERN, a village of

ASPE'RULA. See WOODRUFF.

ASPHA'LT, or ASPHA'LTUM, is the name given to a bituminous substance of a solid consistence. See BITUMEN. It probably owes its origin to vegetable matter which has been subjected to a slow process of decomposition or decay, resulting in the production of a bituminous coal, from which, by volcanic agency, the A. has been distilled and diffused over the neighbouring district. The largest natural deposit of A. is in the island of Trinidad, where the plain known as the *Pitch Lake* is found. See TRINIDAD. The A. from Trinidad is largely used for ships' bottoms, and is reputed to kill the teredo or borer, which proves itself so very destructive to the wood of ships in tropical regions. A. is also found on the shores of the Dead Sea in large quantity, and is known to the Arabs by the name of *Hojar Mousa*, or *Moses's Stone*. It likewise occurs in South America at Coxitambo near Cuenca, in Alsace, and other parts of the European continent, in East Lothian and Fifeshire (Scotland), in Shropshire, &c.

During the manufacture of coal-gas, much tarry matter is evolved from the retort, and is received in the coolers or condensers. If this tar be subjected to partial distillation, naphtha and other volatile matters escape, and an artificial A. is left behind, which possesses the principal properties, and can be employed for the majority of purposes to which native A. is applied. The various kinds of A. have a pitchy odour, are of a black or dark-brown colour, but do not soil the fingers; are insoluble in water, sparingly soluble in alcohol; but are in great part dissolved by ether, oil of turpentine, and naphtha. *Petroleum* (q. v.), or *Rock Oil*, is a native liquid bitumen, which largely exudes from crevices in rocks in many districts, and is essentially A. dissolved in naphtha. The specific gravity of A. is very near that of water, ranging from 1080 to 1100. When set fire to, it burns readily with a smoky flame, and is often used in the smaller gas-works as fuel, by being allowed to run very slowly into the furnace-fires. A., besides being employed for coating the exterior of ships' bottoms, is also used, in a heated condition, for saturating timber which is intended for piles in the construction of breakwaters, river-bridges, and other situations where the combined action of the air, water, and minute animals would soon render ordinary wood rotten and useless. Wooden houses may be preserved in the same manner by a coating of A. applied externally; and ground-flooring placed in damp situations is much the better of the spaces between the planks being filled up with A.

About 1840, A. began to be generally used for foot-pavements in cities, and also for floors of cellars and outhouses. For purposes of this nature it is heated in portable boilers, into which, at a certain stage of the preparation, there is poured a quantity of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid A. The mixture is then spread on the spot prepared for it; and when cool, forms a hard kind of pavement. Of this method of forming footways, high expectations were at first formed; but latterly the process of asphalting has gone out of use in England, as it is found not to be so durable as stone, and therefore, in ordinary circumstances, more costly. In Paris, however, asphalting is still extensively practised in the more spacious thoroughfares. The better kinds of A. are used in the manufacture of the black varnish, which is employed in forming the enamel which coats the variety of leather known as *Patent Leather*. A. is not of itself used in medicine, but its natural solution in naphtha, viz., *Petroleum*, is a valuable agent when applied either externally or internally. The synonyms of A. are—

Native Pitch, Mineral Pitch, Jews' Pitch, Dead Sea Bitumen, Compact Bitumen, Trinidad Bitumen, and *Maltha.*

A'SPHODEL (*Aspho'delus*), a genus of plants which has by many botanists been made the type of a natural order *Asphodeleæ*, now, however, generally regarded as forming part of the order *Liliaceæ*. The *Asphodeleæ* are either fibrous-rooted or bulbous-rooted. Among the latter, are onions, hyacinths, squills, star of Bethlehem, &c.; among the former, asparagus, A., &c. The roots of the asphodels are

White Asphodel.

fleshy and thick. The species are not very numerous, and are mostly natives of the countries around the Mediterranean Sea. The Yellow A. (*A. luteus*) and the White A. (*A. albus*) have long been known in Britain as garden-flowers. The yellow A. has an unbranched stem 2–3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the white A. are all radical, and its flowers are in branched clusters. Both species flower about the time when spring passes into summer.

ASPHY'XIA (Gr.) means literally a cessation of the pulsation from any cause, but is usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid for oxygen. See RESPIRATION. A., or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the phrenic nerve, thus paralysing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen in proportion to other elements, as carbonic acid or sulphuretted hydrogen, which act as poisons when inhaled. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with the gases just mentioned.

As this condition of A. advances, in drowning or otherwise, the small vessels of the lungs become gorged with blood, which the heart has no longer power to force freely through them, the right side of the heart and pulmonary artery become filled with blood, while but little returns to the arterial or left side of the heart.

The person becomes pallid, except in such vascular parts as the lips, cheeks, and finger-tips, which become blue; and soon the blood, no longer aërated, produces the phenomena of poisoning by carbonic acid. After some slight convulsive movements, the person becomes insensible, the pulsations of the heart grow gradually feebler, and at last cease altogether. In man this occurs in from a minute and a half to five minutes. Some persons, no doubt, as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after apparent death. The object of all methods is of course to fill the lungs with fresh air. One of the most efficient is that of the late Marshall Hall: lay the person down at once with his head on his left arm, open the mouth, and draw the tongue forwards, then roll him gently over towards the left till he is nearly quite over on his face, then on to his back again, making the body by its own weight compress the chest, which, on expansion by its elasticity, fills with air. Repeat this about 15 times in a minute. This remedy nearly superseded all others for the restoration of still-born infants and other asphyxiated persons, before the introduction of the method of Dr Sylvester, an account of which is given under RESPIRATION, ARTIFICIAL.

ASPHY'XIANTS. Chemical substances enclosed in shells or other projectiles, and which act by producing a suffocating and poisonous effect. The French secretly made experiments with asphyxiating shot at Brest in 1851. The principle of these missiles seems to have been to carry into an enemy's ship the means of generating deadly gases which would suffocate the crews between decks. Scientific artillerists dread and discountenance these novelties; they have learned to regard war almost as a mathematical science, or, at any rate, as an elaborate application of such science; and they see nothing but savage cruelty in the 'diabolical chemistry' of asphyxiants. General Sir Howard Douglas, in a late edition of his *Naval Gunnery*, says: 'The author learns, with great regret, that some awful experiments have been made with fearful success, in the royal arsenal, with asphyxiant projectiles, combining in a frightful degree incendiary with suffocating effects.' Adverting to sick and wounded men on board a ship-of-war, he exclaimed: 'What shall be said of that inhuman system preparing for naval warfare in this age of enlightened humanity, which would advisedly, purposely, and deliberately consign the whole of these, and all other survivors, to indiscriminate death or mutilation? A ship may be sunk in action; yet there is always time to remove the sick and wounded, and save the survivors; but who shall approach a ship on fire to rescue her crew from the sudden and awful effects of that merciless

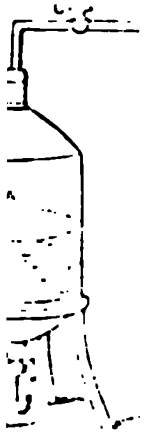
arous system, the object of which is to set
er at heart, and, if possible, blow her up?'
l of Dundonald, Captain Norton, Mr Mac-
nd many other inventors, have within the
years brought asphyxiating compositions
e notice of the English Admiralty and War-
nd the French are known to possess many
store. Some of these compositions are
hich burn fiercely, and ignite wood and
adily; some are contained in shells which,
ng, scatter the suffocating and burning sub-
ll around; and some assume other forms.

DIUM. See FERN, MALE.

SWALL, a town in Colombia, virtually,
a colony of the United States. It is
at the Atlantic extremity of the Panama
in lat. 9° 22′ N., and long. 79° 55′ W., being
miles to the north of the old Spanish
Chagres, 49 miles from Panama, and equi-
rom the great trading capitals of Valparaiso
Francisco. From its commanding position
e of transit, A. is one of the busiest and
sperous towns in the New World. It mono-
s benefits of the traffic in both directions,
most utter exclusion of the rapidly decay-
ma. Already the great link between the
and the west coasts of America, it promises
tant day to connect that ocean with Aus-
dia, China, and Japan.

RATE, the name given to the letter *h* in
as marking, not an articulate sound, but a
(Lat. *spiro*, I breathe). It is also applied to
l consonants. There is felt at once to be
a, accompanied by a difference, between *p*
nd *th*, &c. To express the difference, the
ed the first of such a pair *psilon* (bare),
d *dasu* (rough); the Latin grammarians
terms *lene* and *aspirate*, probably from
ous notion that the difference consists in
tion of the sound of *h*. There being no
ul no character in Latin corresponding to
k *θ* (*theta*), the Romans represented it by *th*;
misleading expedient is continued for repre-
this aspirate and several others in all the
s derived from the Roman. According to
word ought to be *asperate*, i. e., 'roughened.'
sixteen mutes in a complete system (see
), eight are lene, each having its correspond-
ate.

ene—	*p*,	*b*,	*t*,	*d*,	*k*,	*g*,	*s*, *z*.
spirate—	*f*,	*v*,	*th*(an),	*th*(ine),	*ch*,	*gh*,	*sh*, *h*.



spirator.

In the corresponding words of allied languages, nothing is more common than the interchange of an aspirate and a lene: Ex., Lat. *pater*, Eng. *father*; Gr. *thura*, Ger. *thur*, Eng. *door*; Lat. *caput*, Fr. *chef*, Eng. *chief*; Ger. *weib*, Eng. *wife*. Aspirated letters are also frequently interchangeable with one another: thus, Gr. *ther*, a wild beast, is in Lat. *fera*; Lat. *facere*, to do, becomes in Span. *hacer*.

ASPIRATOR is the name of an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical chemist. The simplest form of apparatus is that represented in the figure, where A is a large vessel capable of being filled with water, having a tube with stop-cock at B, a second tube with stop-cock at C, and a thermometer introduced at D. In working, the apparatus is filled with water; the tube C is attached to the vessels through which the gas is to be drawn; and the stop-cocks at C and B being opened, the weight of the water escaping at B acts as suction, and draws in the gas from the tube C and the attached bottles or other vessels. The thermometer at D denotes the temperature of the water, and subsequently gas, contained in the reservoir, while the upright turn of the tube B keeps any air from entering the reservoir by that route.—A more complicated form of A., but one which is much more convenient to experiment with, is that known as Brunners's A.; the principle of action, however, is the same.

ASPLENIUM, a genus of Ferns, of the order or sub-order *Polypodiaceæ*. The species are numerous, and widely diffused both in the northern and southern hemispheres. Many of them are of great beauty; and the small size of some recommends them to cultivators of ferns who find themselves much limited as to space. Some of the species bear the English name *Spleenwort*, as *A. Trichomanes*, *A. viride*, *A. Adiantum-nigrum*, &c., having been formerly supposed efficacious in removing obstructions of the viscera. From the same circumstance the name A. (Gr. *a*, privative, and *splen*, the spleen) is derived. They have now fallen completely into disuse, but were at one time very much employed, chiefly in the form of a syrup like *Capillaire* (q. v.), and were administered not only in cases of cough, asthma, diseases of the liver, and cutaneous diseases, but even in stone and gravel. But perhaps none of them was so extensively used as the species which is styled in old books Common Spleenwort (*A. Ceterach*), now the type of a distinct genus, and known as *Ceterach officinarum*. Some of them, as *A. Trichomanes* and *A. Adiantum-nigrum*, are frequently called Maidenhair. *A. Trichomanes* is a very beautiful little fern, common on rocks and old walls in Britain, and most parts of Europe, found also in some parts of Africa, and in North America. A very common British species, *A. Ruta-muraria*, is popularly known as Wall rue.

ASS (*Equus Asinus*), a well-known quadruped, usually referred by naturalists to the same genus with the Horse (q. v.), but which it has recently been attempted to make the type of a distinct genus (*Asinus*), including all the solid-hoofed quadrupeds (*Solidungula* or *Equida*, see HORSE) except the horse itself. The distinction is founded on the short hair of the upper part of the tail and the tuft at the end of it, the darker stripes with which the colour is marked, and the absence of the hard horny warts which are found on the hinder-legs of the horse, although the fore-legs exhibit warts in a similar position. The long ears of the A. are one of the characteristics of the species, but they are longer in domestication than in a wild state. It is usually also distinguished by a black cross over the shoulders, formed by a longitudinal and a transverse streak, the general colour being gray; but when the general colour is darker or lighter than usual, the cross is often less apparent, or to be observed with difficulty. The facial line is arched.

Some uncertainty still exists as to the origin of the domestic A.; a number of wild races having been described, some of which are perhaps, like the wild horses of America, the progeny of animals that have escaped from domestication. The probability, however, appears to be that the A. is a native of Central Asia, where it is found in a perfectly wild state, in Tatary, Mesopotamia, Persia, &c., on the

banks of the Indus, and even to the southern extremity of Hindustan; but its range does not extend so far northward as that of the wild horse—a circumstance which may perhaps partly account for the inferiority of the domestic A. in northern climates. The wild A. is found both in mountainous districts and in plains; vast troops roam over the great Asiatic deserts, migrating, according to the season, in summer, as far northward as the Ural; in winter, southward to the borders of India. It is fond of bitter and saline herbage, and of brackish water. It was first accurately described by Pallas, under the name *Koulan*, which it bears on the high steppes around the Caspian Sea. It was, however, well known to the ancients, and is called *Onager* and *Asinus sylvestris* by Pliny, who also mentions, under the name *Hemionus*, another species (*Equus Hemionus*), a native of the same regions, now called the *Kiang*, or the *Dziggethai*. The latter name appears to be of Turkish origin, and to signify Mountain A., but seems to be sometimes applied to the one of these species and sometimes to the other. This seems also to be the case with some of their other eastern names, as Khur or Goor, and is a source of no little confusion.—The cross on the shoulders is less observable in the Koulan than it usually is in the domesticated A. It ought also to be mentioned that, in one remarkable particular, the domesticated A. agrees with the *Equus Hemionus*, and differs from the Koulan, the infra-orbital foramen of the skull being situated much lower. But the Kiang neighs like a horse, and the other *brays*. The harshness of the voice of the A. is ascribed to two small peculiar cavities situated at the bottom of the larynx.

The allusions to the wild A. in the Old Testament, and particularly in Job xxxix., naturally excite the surprise of readers acquainted only with the dull domestic drudge, the emblem of patience and stolidity; but to this day they are beautifully appropriate to the wild A. of 'the wilderness,' which has the 'barren land' or 'salt places' for its dwelling, and 'the range of the mountains' for its pasture. —The wild A. has a short mane of dark woolly hair, and a stripe of dark bushy hair runs along the ridge of the back from the mane to the tail. It has longer legs, and carries its head higher than the domestic A. Its troops have always a leader. It is a high-spirited animal, very fleet and very wary, trying to the utmost the powers of the hunter. It is a principal object of the chase in Persia, where its flesh is prized as venison is in Europe, and it is accounted the noblest of game. Xenophon, in his *Anabasis*, describes the wild A. as swifter of foot than the horse, and its flesh as like that of the red deer, but more tender.

The domestic A. is also, in Arabia, Persia, Syria, and other eastern countries, a much finer animal than as it is usually seen in Europe, although in Spain the favourable influence of a more genial climate upon its development is visible, perhaps also of better treatment, the A. being more highly valued. The A. is much used for riding in the East. From Judges v. 10, we learn that, at a very early period, the great were accustomed to ride upon white asses, and a preference is given to white asses in the East to this day. The A. has been domesticated from the earliest times; but it does not seem to have been introduced into Europe till a comparatively recent date. In Britain, it is employed chiefly by the poor, but might probably with advantage be much more generally employed than it is. Its price is scarcely one-twentieth of the price of the horse, and it can be kept at one-fourth of the expense, delighting in the coarse herbage which other animals reject, and satisfied with comparatively scanty fare. The obstinacy ascribed to the A. seems to be very generally the result of ill treatment; and proverbial

The Wild Ass.

as it has become for stupidity, it is probably quite equal in intelligence to the horse.

There are two hybrids between the A. and the horse—the MULE (q. v.), bred between the male A. and the mare; and the HINNY (q. v.), the offspring of the horse and the female A.

The milk of the A. contains more sugar of milk and less caseine than that of the cow, and is therefore recommended as a nutritious diet in cases of weak digestion. Its usefulness in cases of consumption has been long known, and it was often prescribed as a kind of specific when that disease was treated on principles very different from those which regulate its treatment now, and when very nutritious food was not usually prescribed to consumptive patients.

The leather called Shagreen (q. v.) is made by a peculiar process from the skin of the A., which also affords excellent leather for shoes, and the best material for drums. The bones of the A., which are very solid, were used by the ancients for making flutes.

ASSAI, a beverage very much used at Pará and other places on the Amazon, and which is prepared from the fruit of certain species of palm nearly allied to the Cabbage Palm of the West Indies. See ARECA and CABBAGE PALM. The A. palms are remarkably slender trees; the most common species (*Euterpe oleracea* of Martius) rising to the height of sixty or eighty feet, with a smooth stem only about

inches in diameter. The fruit is small, in size
olour resembling aloes, but is produced in great
quantity upon branched *spadices*, which are thrown out horizontally beneath the crown of leaves. It consists of a hard seed, with a very thin covering of a firm pulp or flesh. The tree grows in swamps flooded by the high tides. Boys climb the trees for the fruit, upon which warm water is poured, and by rubbing and kneading, a liquid is procured, consisting simply of the pulp of the fruit and water, which is constantly vended in the streets of Pará, and of which the inhabitants are extremely fond. This is A. It is a thick, creamy liquid, of a purplish colour, and a flavour like that of a freshly gathered nut. It is commonly used along with the bread made from Manioc (q. v.), called *farinha*, and either with or without sugar. Half the population of Pará make a daily meal of A. and farinha; and upon this hundreds are said chiefly to subsist.—The stem of the A. palm is sometimes used for poles and rafters, and its terminal bud cabbage or as a salad with oil and vinegar; s too much valued upon account of its fruit often cut down for these purposes.—An species, *Euterpe Catinga*, is found in forests dry sandy soil and very peculiar vegetation, a as Catinga forests. The beverage made it is sweeter than the common kind, but roduce of the tree is much smaller.

Palm (*Euterpe oleracea*).

L, an important salt-lake in the east of 25 miles south-west of Tajurrah, the chief of Adel, lat. 11° 40′ N., long. 42° 40′ E. Its is 8 miles; its breadth, 4. It lies in a land le for its wild, waste, and sterile character. ed on all sides but the east by hills, and ..0 feet below the level of the sea. Abyss- ans resort to it for the purpose of carry- salt which incrusts its shores like ice, to the depth of half a foot. It has been d that it was at one time connected with the Tajurrah.

a province at the north-east extremity dia, stretching in N. lat. from 25′ 40′ , and in E. long. from 90° 40′ to 97° 1′, and ised, in 1872, 2,207,453 inhabitants on an area 30 square miles. It forms part of the basin Lower Brahmaputra, and is intersected also out sixty other rivers. Being thus irrigated, were, by nature, A. abounds in wood, and is fertile. Among its indigenous productions is a-plant. In the year 1872, 31,303 acres were cultivation for the growth of this plant, and ield was 6,257,643 lbs of tea. The other pro- are rice, mustard, gold, ivory, amber, musk, , iron, lead, petroleum, and coal. From d the principal imports are woollens, India s, salt, opium, glass, earthenware, tobacco, &c.

1826, at the close of the first Burmese war, A. ded to the British. The upper portion of the province, however, was conferred, as a separate principality, on the native rajah, whom the Burmese had expelled; and it was only in 1838, that, in consequence of his misgovernment, the entire country was actually placed under British administration. Since then, the province has exhibited a noticeable improvement, for which, considering that the population is barely 33 to the square mile, there is still, however, almost unlimited scope. The great evil is the prevalence of earthquakes, few months passing without a shock or two. The people, however, seem to think lightly of them—the only one that is specially remembered as being of extraordinary severity having occurred as far back as 1807.

A. is divided into Upper and Lower, which are again subdivided into districts. Gowhati is the only town worthy of the name.

One of the most striking features of A. is the abundance of wild animals, such as tigers, rhinoceroses, leopards, buffaloes, and elephants. Of the elephants, not less than 500 are annually caught; and, when tamed, bands of them may be seen, harmless as cows, in the charge of a single attendant. The forests teem with game, and the rivers with fish.

ASSASSINS, a military order, a branch of the secret sect of the Ismaelites (q. v.). The secret doctrines of these Ismaelites, who had their headquarters in Cairo, declared the descendants of *Ismael*, the last of the seven so-called imaums, to be alone entitled to the califate; and gave an allegorical interpretation to the precepts of Islam, which led, as their adversaries asserted, to considering all positive religions equally right, and all actions morally indifferent. The atrocious career of the A. was but a natural sequence of such teaching. The founder of these last, Hassan-ben-Sabbah-el-Homairi, of Persian descent, and imbued with the free-thinking tendencies of his country, had, about the middle of the 11th c., studied at Nishpur, under the celebrated Mowasek, and had subsequently obtained from Ismaelite *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of dai. But on betaking himself to the central lodge at Cairo, he quarrelled with the heads of the sect, and was doomed to banishment. He succeeded, however, in making his escape from the ship, and reaching the Syrian coast, after which he returned to Persia, everywhere collecting adherents, with the view of founding, upon the Ismaelite model, a secret order of his own, a species of organised society which should be a terror to his most powerful neighbours. In 1090, Hassan conquered the fortress of Alamut, in the Persian district of Rudbar; and continued to increase in strength, intimidating princes and governors by a series of secret murders, and gaining possession of several fortified castles, with their surrounding territories, both in the mountain range south of the Caspian, in Kuhistan, and in the mountains of Syria (Massiat). The internal constitution of the order, which had some resemblance to the orders of Christian knighthood, was as follows: First, as supreme and absolute ruler, came the Sheikh-al-jebal, the Prince or Old Man of the Mountain. His vicegerents in Jebal, Kuhistan, and Syria were the three *Dai-al-kebir*, or grand-priors of the order. Next came the Dais and Refiks, which last were not, however, initiated, like the former, into every stage of the secret doctrines, and had no authority as teachers. To the uninitiated belonged first of all the Fedavies or Fedais—i. e., the devoted: a band of resolute youths, the ever ready and blindly obedient executioners of the Old Man of the Mountain. Before he assigned to them their bloody tasks, he used to have them thrown into a state of

ecstacy, by the intoxicating influence of the *Hashish* (the hemp-plant), which circumstance led to the order being called Hashishim, or hemp-eaters. The word was changed by Europeans into Assassins, and transplanted into the languages of the West with the signification of murderers. The Lasiks, or novices, formed the sixth division of the order, and the labourers and mechanics the seventh. Upon these, the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as null. The catechism of the order, placed by Hassan in the hands of his dais, consisted of seven parts, of which the second treated, among other things, of the art of worming themselves into the confidence of men. It is easy to conceive the terror which so unscrupulous a sect must have inspired. Several princes secretly paid tribute to the Old Man of the Mountain. Hassan, who died at the age of 70 (1124 A.D.), appointed as his successor, Kia-Busurg-Omid, one of his grand-priors. Kia-Busurg-Omid was succeeded in 1138 by his son Mohammed, who knew how to maintain his power against Nureddin and Jussuf-Salaheddin. In 1163, Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islam in the Assassin state; which led to his falling a victim to his brother-in-law's dagger. Under the rule of his son, Mohammed II., who acted in his father's spirit, the Syrian Dai-al-kebir, Sinan, became independent, and entered into negotiations with the Christian king of Jerusalem for coming over, on certain conditions, to the Christian faith; but the Templars killed his envoys, and rejected his overtures, that they might not lose the yearly tribute which they drew from him. Mohammed was poisoned by his son, Hassan III., who reinstated Islamism, and thence obtained the surname of the New Moslem. Hassan was succeeded by Mohammed III., a boy of nine years old, who, by his effeminate rule, led to the overthrow of the order, and was eventually murdered by the command of his son, Rokn-eddin, the seventh and last Old Man of the Mountain. In 1256, the Mongolian prince, Hulagu, burst with his hordes upon the hill-forts of Persia held by the Assassins, which amounted to about a hundred, capturing and destroying them. The Syrian branch was also put down about the end of the 13th c., but remnants of the sect still lingered for some time longer in Kuhistan. In 1352, the A. reappeared in Syria, and indeed they are still reported to exist as a heretical sect both there and in Persia. The Persian Ismaelites have an imaum, or superintendent, in the district of Kum, and still inhabit the neighbourhood of Alamoot under the name of Hosseinis. The Syrian Ismaelites live in the district of Massiat or Massyad. Their castle was taken from them in 1809 by the Nossaries, but afterwards restored. See Hammer, *Geschichte der Assassinen* (Stutt. and Tüb. 1818).

ASSAULT. In the sudden and vigorous attack of a fortified post, which is called an *A.*, the troops are told-off into 'storming-parties,' 'supports,' and 'firing-parties.' The storming-parties are those who take the most terrible duty, being that of making a forcible entry into the place. The firing-parties or musketeers seek to shield the storming-parties as much as possible from the fire of the enemy; they spread themselves out in extended order, to keep down the fire of the garrison—aiming at any soldier who may shew his head above the parapet, and seeking to disable the artillerymen by firing into the embrasures. Many assaults are made by *surprise*; and in that case the storming and firing parties order all their preliminary movements as quietly as possible. In most cases, there is a necessity for the stormers to descend into a dry ditch, and to ascend from the ditch to a breach or a gate in the fortified wall. To aid in this duty, 'ladder-parties' are placed at the disposal of the storming-parties; these men have previously been practised in carrying scaling-ladders, descending and ascending ditches, and adjusting the ladders. In some celebrated sieges, ladders 40 feet long have been used, where the ditch was deep and the wall or bastion high; but it is seldom that a storming-party could venture on so perilous a work, for the men crowded on such a ladder would endanger each other. The 'supports' are troops who keep a little in the rear of the storming and firing parties.

ASSAULT, in Law. See BEATING AND WOUNDING.

ASSA'Y, or ASSA'YING, is the process employed in determining the proportion of pure metal in a metallic ore or in an alloy. This method of analysis is more generally followed in the examination of compounds of silver and gold, but is likewise resorted to in the investigation of ores of iron, copper, tin, zinc, bismuth, antimony, mercury, and lead. In manufactured articles, also, such as silver-plate and gold-plate, some foreign metal (generally copper) is present, to impart hardness to the metal; and in Great Britain, each article is assayed at the Goldsmiths' Hall, previously to being sold, so as to determine the exact richness of the metal whereof it is made. In the A. of compounds containing silver, the apparatus employed is a *cupel*—a small

Cupel.

basin-shaped vessel of the form and size of the figure, made of bone-ash; and a *muffle*, composed of fire-clay, about 8 inches in length and 3 to 4 inches in diameter, shaped like a miniature railway-tunnel,

Muffle.

open at the one end, A, closed at the other end, B, and having numerous slits or air-holes, C, along the side. The more simple A. of silver consists in the examination of argentiferous lead ore. By a preliminary process, the sulphur is separated (see LEAD); and weighed fragments of the mixed lead and silver being placed on cupels, the latter are introduced into the muffle, which has been previously heated in a furnace, where it still remains. The fire is then increased, and air being admitted to the muffle, the oxygen of the air unites with the lead, forming oxide of lead (PbO), which in part volatilises through the openings in the side of the muffle, and in other part sinks into the porous bone-earth of which the cupel is made. Whilst the lead is thus carried away, the silver remains behind as a molten metallic globule, and when the last traces of lead-fumes leave the silver bead, the latter suddenly *lightens*, and immediately thereafter becomes brilliant and white. On being slowly allowed to cool, the globule of silver may be weighed, and the amount of pure metal

letermined. The use of the cupel during this ess has led to the term *cupellation* being em-ed in place of A. When silver contains copper, ch it does in ordinary coinage and silver-plate, it omes necessary to mix lead with the alloy before mpting to separate the copper. The manner in ich the lead is generally added is to roll the y of er and copper in a piece of sheet-lead or l-f and place the whole package on the cupel. ase heating in the muffle, the lead oxidises l, and in part passing into the bone-earth of el, carries the copper with it. The amount a required to effect the separation of copper silver in this way is given in the following e :

ount of Silver in One Part.	Amount of Copper Alloy in One Part.	Quantity of Lead Necessary for One Part of Alloy.	Quantity of Lead in Relation to that of Copper
1000	0	½ part.	
950	50	3 parts.	60 to 1
900	100	7 "	70 " 1
"	200	10 "	50 " 1
	300	12 "	40 " 1
	400	14 "	35 " 1
	500	16 to 17 "	32 " 1
	600	16 " 17 "	27 " 1
"	700	16 " 17 "	23 " 1
	800	16 " 17 "	20 " 1

When the gold is accompanied by silver as well as copper, iron, and lead, it is necessary in the first place to subject the alloy to the A. process in the ordinary way, which gets rid of the copper, iron, and lead, but leaves the silver still incorporated with the gold. The weight of this residual button gives the combined weights of the silver and gold present in the alloy. The method of separating the silver from the gold is called *parting*, and consists essentially in acting on the alloy with hot nitric acid, which dissolves away the silver, forming the soluble nitrate of silver ($AgONO_3$), and leaves the gold undissolved. When the silver is present in small proportion, the gold assumes a protective influence, and keeps the nitric acid from acting on the silver ; and to effect this separation satisfactorily, it is necessary that there should be about three parts of silver to one of gold. As that proportion does not occur naturally, or in any kind of manufactured gold-plate, it is requisite to incorporate some silver with it. This is generally accomplished by taking the proper quantities of gold and silver, wrapping them up in a piece of lead-foil, and heating on a cupel. The lead, during its disappearance from the heating vessel, causes the most intimate amalgamation of the silver and gold, which are left on the cupel as a metallic button. The latter, on being allowed to cool, is beaten out on an anvil with a smooth hammer, and is then passed through steel rollers, which yield a ribbon of alloy about the thickness of an enamelled address-card. The ribbon of metal being coiled up, is technically called a *cornet*, and when introduced into the flask with nitric acid, the entire solution of the silver is accomplished, whilst the gold is left as a brown-coloured spongy mass, of the shape and size of the cornet. To give the metal the appearance and compactness of ordinary gold, the very friable metallic ribbon is gently transferred from the *parting glass* to a crucible by inverting the former into the latter ; and the liquid which runs in with the gold being poured off, the crucible and its contents are raised to a red heat in a furnace, when the gold recovers its beautiful yellow colour and metallic lustre, and at the same time becomes soft and flexible. The gold is now pure, and in a fit condition to be weighed, and the amount obtained indicates the proportion of pure gold in the original alloy. As the quantity of silver which is required to be present during this process, in order that the *parting* by nitric acid may readily take place, is three parts of silver to one of gold, it is customary to call this department of a gold A. *quartation* or *inquartation*.

During the A. of silver or of gold, it is necessary to guard against any sudden increase or decrease in temperature. Independently of the probable loss of metal through the fracture of the cupels, it is found that when the final buttons of pure metal are obtained on the red hot cupel, if great care be not taken to cool the whole very slowly, the bead of gold or silver *spits*, and little portions are thrown off.

The mode of assaying gold now described cannot always be followed out in the examination of jewellery and other manufactured articles, as, though only a few grains are required for the A., yet the removal of such might entail the destruction of the article, and in such circumstances the *touchstone* is resorted to. This stone was originally brought from Lydia in Asia Minor, and consisted of a coarse-grained quartz saturated with bituminous matter, but black basalt and other stones are now employed for the same purpose. The manner of using the stone is to draw a streak upon it with the auriferous article ; and from the colour of the streak the richness of the gold can be very accurately determined by the practised

assayer. The subsequent action of nitric acid on the golden streak serves still further as a means of determining the purity of the metal, as the acid readily dissolves the copper and silver, and leaves the gold.

ASSA'YE, a village in the territory of the Nizam, lat. 20° 18′ N., and long. 75° 55′ E. It stands in the doab, or fork, of the Juah and Kaitna. A. claims notice chiefly as the scene of the first great victory of the Duke of Wellington, then Major-general Wellesley, won on the 23d September 1803. The British troops in action were only about 4500, while the Mahrattas under Scindia and the rajah of Berar numbered 50,000, of whom 10,000 were commanded by French officers. 98 pieces of cannon, 7 standards, all the baggage, and a large part of the ammunition of the Mahrattas fell into the hands of the conquerors, whose military supremacy was soon acknowledged over a great portion of India. In 1851 a medal was struck in commemoration of the victory.

ASSEERGHU'R, a fort situated on an isolated mountain at the north-east angle of the presidency of Bombay, in lat. 21° 26′ N., and long. 76° 26′ E. Its elevation above the base of the mountain is estimated at 750 feet. Its extreme length and breadth are respectively 1100 and 600 yards; from the irregularity, however, of the outline, the area is computed at not more than 300,000 square yards, or somewhat less than $\frac{1}{10}$th of a square mile. With the exception of two avenues of ascent, both of them difficult and strongly fortified, the space is everywhere terminated by a carefully scarped precipice, varying in height from 80 to 100 feet. This formidable fastness has been twice taken by the British—first in 1803, and finally in 1819.

ASSE'MBLY (*assemblée*), in the conduct of an army, is the second beating of the drum before a march, at which the soldiers strike their tents if encamped, roll them up, and stand to arms.

ASSE'MBLY, GENERAL, in Scotland, Ireland, and the United States, denotes the highest court of the Presbyterian Church. It differs from the Anglican Convocation at once in its constitution and in its powers, representing as it does both the lay and the clerical elements in the church, and possessing supreme legislative and judicial authority in all matters purely ecclesiastical. The General A. of the Established Church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the General A. of the Established Church, and each of the Scottish universities sends a representative. The Assembly meets once a year, in the middle of May, at Edinburgh, and sits for ten days. Its deliberations are presided over by a Moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times, this office was sometimes filled by laymen: among others, in 1567, by George Buchanan. In modern times, the moderator is always a clergyman. 84 presbyteries, composing 16 synods, return members to the General A. of the Established Church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the A. beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a deputy clerk, both clergymen, a procurator, and an agent. All business not despatched during the session of the A. is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the A., and again quarterly. The General A. of the Free Church of Scotland, which has 16 synods comprising 71 presbyteries, and of the Irish Presbyterian Church, are similarly constituted, the only point of difference being the absence of the royal commissioner. See PRESBYTERY, SYNOD, ACT, &c.

ASSE'MBLY, NA'TIONAL (France). The first general (q. v.), convoked by Louis XVI. on 5th May and opened May 5, 1789, consisted of the three privileged orders, clergy and nobles, and of the third estate or commons. The privileged orders refusing to join the third estate and deliberate in a common hall, the latter, of its own authority, June 17, assumed the title of *Assemblée Nationale*, and the deputies in the name of France. The court attempted to annul this resolution in a royal sitting, June 23; but the deputies of the third estate, along with a few members of the other two orders, had bound themselves by oath not to separate until they had given France a constitution, and had resisted every attempt at violence on the part of the court. They refused to quit the common hall, and at last yielded, and commanded the nobles and clergy to join the National A. This was the beginning of the revolution, and the A. proceeded with astonishing rapidity to metamorphose old France. The abolition of all privileges on the 4th August was followed by that of hereditary jurisdiction, the removal of restraints on religion and the press, and the declaration of the Rights of Man (q. v.). In August 1790, the monastic orders were suppressed, and the remnants of feudalism swept away; in February the *lettres de cachet* and the oppressive salt-tax were abolished; in June, all orders and titles of nobility. In July, non-catholics had the property confiscated from their ancestors restored; Jews were relieved from personal taxation; and game-laws abolished. A decree of October 18 abolished the cruel penalties of Louis XIV. In January 1790, corporations and guilds were abolished, and trial by jury introduced. In February, political rights were conceded to Quakers; in May, the customs at the frontiers were abolished; in June, the torture; and the violation of the secrecy of letters was also declared illegal. In September, all citizens, of whatever creed or religion, received political rights.

The principles on which the Assembly proceeded were the sovereignty of the people, the independence of the communes, the limitation of the royal power through a conditional Veto (q. v.), the separation of the political authorities, and the responsibility of ministers. Accordingly, the A., shortly after it constituted, declared that to it alone, without the royal veto, belonged the legislative power. By decrees, in September 1789, determining that the legislative body should form only one chamber, and should be renewed every two years; that it alone declared the king inviolable, and the throne unable. A decree of 7th November forbade the members to undertake the place of ministers; in December the new organisation of the communes was fixed. By January 1790, France was divided into departments; in April, trial by jury was introduced; in May it was declared that the right of war and peace belonged to the nation alone, that is, to the A.

In regard to finance, which had been the immediate cause of the Assembly's being convoked, reforms were equally thorough. It was decreed at the outset that taxes were to be apportioned and raised without regard to rank or person, and followed the approval of a loan of 80 millions. A decree of November 1789 ordered the sale of the public accounts; another in December established a national bank. In March 1790 came the first law sanctioning the sale of the national domains worth of the national domains; and in May another ordering the issue of *assignats* (q.

...MBLY OF DIVINES, or WEST- ...ER ASSEMBLY, a celebrated convocation ... by the Long Parliament for settling the ..., liturgy, and government of the Church of ... It consisted of 120 clergymen and 30 lay- ... of whom were lords and 20 commoners — with 4 clerical and 2 lay commissioners ... Church of Scotland. Among the more ...shed of the divines were Usher, Saunder- ...nolds, Brownrigg, Ward, Twisse, Lightfoot, ..., Burges, Goodwin, Calamy, and Nye; of ...en, Selden, Prideaux, the two Vanes, Rouse, ...hitelocke, St John, and Maynard. The ... were Henderson, Gillespie, Ruther- ... ... 25 of those whose names were ...d ... ordinance calling the Assembly, ...ted 12th June 1643, never appeared ...ns, one or two of them having died ... ... of the first meeting, and the others ...pleasure of the king. To supply the ...se absentees, some additional members, called the superadded divines, were summoned to attend. This notable Assembly held its first meeting on the 1st of July 1643, and continued to sit till the 22d February 1649, during which time it had met 1163 times. Its most important work was concluded long before that time. One of the first things it did was to give its sanction to the *Solemn League and Covenant*, against which Dr Burges alone stood out for several days. The Presbyterians formed a large majority in the Assembly, and exercised a corresponding influence on its decisions. In doctrine, the members were almost unanimous; but on the subject of church government, opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal fruits of its deliberations were the *Directory of Public Worship*, submitted to parliament April 20, 1644; the *Confession of Faith*, October and November 1646; the *Shorter Catechism*, November 5, 1647; and the *Larger Catechism*, September 15, 1648. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorised standards of the Presbyterian churches of Scotland, Ireland, and England. The *Directory of Public Worship* was ratified by both Houses of parliament, October 2, 1644, and the doctrinal part of the *Confession of Faith* in March 1648. An order of the House of Commons, October 13, 1647, ordained that the Presbyterian form of church government should be tried for a year, but no further legislation followed. What has hitherto been known as to the details of the proceedings of this remarkable convocation, has been derived chiefly from the *Letters* of Baillie, and Lightfoot's *Journal*. See Hetherington's *History of the Westminster Assembly* (1843); and the 2d volume of Masson's *Life of Milton*, published in 1871 (pp. 539–527), where a list of the members, with brief biographic notices, is given.

ASSENT, ROYAL, is the regal act by which the sanction of the crown to bills which have passed through both Houses of parliament is given. See ROYAL ASSENT.

ASSER, JOHN, the learned and congenial biographer of Alfred, was a monk of St Davids, from the Latin name of which, *Menevia*, he is termed in the old records *Asserius Menevensis*. About the year 880, his reputation for learning and piety procured him an invitation to the court of Alfred, where he resided at intervals during the rest of the king's life, assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have been every way worthy. The king promoted him to various dignities, and finally made him Bishop of Sherburn. The *Saxon Chronicle* fixes the date of his death to the year 910. Several works have, with more or less authority, been attributed to A. The only one undoubtedly his, by which we can now judge of him as a man and a writer, is his *Annales Rerum Gestarum Aelfredi Magni*. This simple and most interesting narrative was first published in 1574 by Archbishop Parker. Its trustworthiness has recently (1842) been questioned by Mr Thomas Wright, in the article 'Asser' of his *Biographia Britannica Litteraria*. This gentleman has assuredly made the most of the objections to its reliability that can be legitimately urged. Langard and Dr Pauli have replied to these, and, at present, the general impression of scholars of Anglo-Saxon literature is that there is no good reason for doubting its general accuracy and fidelity. The best edition is that of Wise (Oxf. 8vo. 1722).

ASSES, FEAST OF. See FOOLS, FEAST OF.

ASSE'SSED TAXES. These are duties assessed and charged upon the people, under the authority of numerous acts of parliament, beginning with the 43 Geo. III. c. 99. The duties now comprised under this branch of taxation are those on inhabited houses, male-servants, carriages, horses, and mules, dogs, horse-dealers, hair-powder, armorial bearings, and game. The duty on inhabited houses was substituted, by the 14 and 15 Vict. c. 36, for a former tax on windows. The A. T. are under the management of the Commissioners of Inland Revenue. See TAXES.

ASSE'SSORS may be defined as persons who are sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They are called *A.*, because, according to the Latin derivation and literal meaning of the word, they sit *side by side* with others. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. A. are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the 5 and 6 William IV. c. 76, commonly called the Municipal Corporation Act, it is, by section 37, enacted that the burgesses shall annually elect from among those qualified to be councellors, two auditors and two A., the former to audit the accounts of the burgh, and the latter to revise the burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who, in fact, holds courts for the bishop. But in the case of a complaint against a clergyman for any ecclesiastical offence under the Church Discipline Act (the 3 and 4 Vict. c. 86), the bishop is directed to inquire into the matter, assisted by three A., of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a serjeant at law, or an advocate who has practised five years in the court of the archbishop of the province, or a barrister of seven years' standing, another.

The judges of the common law courts, and the Queen's counsel, being serjeants, are, as a condition of their offices, A. of the House of Lords, advising the House on points of law which may be propounded to them by their lordships.

A'SSETS. This is one of those terms in the law of England which in itself bears evidence of a Norman origin. It is derived from the French word *assez*, or more exactly, in Norman-French, *assetz*, 'enough' or 'sufficient,' signifying the property of a deceased person, which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptation, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

A. are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including all real estate, whether devised or descending to the heir at law. In connection with this distinction, A. are also said to be *A. by descent*, and *A. in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—A. in hand, again, signifying such property as a person leaves to his executors sufficient for the clearing of burdens and bequests affecting his personal estate. A. are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole A. which have come to his hands, by the payment of debts in due order, he be afterwards sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plene administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other A. that shall come to the defendants, which is called a judgment of A. *in futuro*.

A. is not a technical term in Scotland, but it is nevertheless much used in the legal business of that country.

ASSI'DIANS. See CHASIDIM.

ASSIE'NTO, i. e., treaty, a word specially applied to a compact between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. It was Charles I. of Spain who first concluded an A. with the Flemings. Next, a similar compact was entered into with the Genoese (1580 A.D.), the Portuguese (1696), and on the accession of Philip V. to the Spanish throne in 1702, with the French Guinea Company, which from that time took the name of A. Company, upon the understanding that for ten years it should have the exclusive right of annually importing 4800 negroes of both sexes to the continent and islands of Spanish America. The A. was next transferred to England at the peace of Utrecht in 1713, and made over by government to the South Sea Company for 30 years, permission being also granted to the company to send yearly, during the term of contract, a ship, carrying 500 tons of goods, to these Spanish colonies. The misunderstandings that grew out of this last clause contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them at the general Convention of 1750, upon the payment of £ and the concession of certain commercial advantages.

ASSI'GN, To, in Law, signifies to transfer or make over to a third party a security, a right of action, or other right, whether in possession or in reversion, granted by a party indebted or under obligation to the party assigning. The words of assignation are *to A., transfer*, and *set over*, and they operate to transfer both real and personal property. A *chose in action* (q. v.), contrary to the ancient principle, can now be assigned in England indirectly by the common law, and directly according to the recognised principles of the courts of equity. Besides its general application of the word, as a technical term in conveyancing, both in England and Scotland, it is also employed in England in judicial procedure where the decision of an inferior court is brought under review, and in proceedings in bankruptcy. See ASSIGNMENT, ASSIGNATION, APPEAL, ERROR, BANKRUPTCY.

ASSIGNATION is a legal term in Scots conveyancing, analogous to the English word assignment (q.v.), by means of which the holder of a debt or the creditor in any obligation, or the proprietor of any subject not properly feudal (see FEUDAL SYSTEM), transfers his right or estate to a

e party making the A. is called the *cedent*, rty in whose favour the A. is made is *assignee* or *cessionary*, and the act of thus made is irrevocable, an element in hich has been traced to the practice of h law, a source from which the Scotch the 16th c. borrowed so much—the Court itself being a mere copy of the Parliament direct conveyance of a debt in France was *transport*; the granter, *cédant*; and the *ire*; and these terms, derived from introduced into the Scotch law; s of the parties to an A., as we Unlike the English common-law view gnment, the Scotch A. has the effect of he assignee with the whole right, which cedent, although, according to the ancient e A. gave, not simply the sum or subject ut also the deed or written evidence of r assigned, a form arising from the instrument having been regarded a mandate or power of attorney to make his claim and to act as in In modern practice, however, , to ploy simply the terms 'assign, d make over,' which correspond with the ter of the deed. In order, however, to he A., it must be *intimated* to the common st in, the party originally indebted to the d so essential is this intimation, that in f competing claims against the right estate assigned, the A. first intimated d to one prior in date, but posterior tion. Such intimation ought to *Public* (q. v.), but other formal notice of the A. is sometimes admitted. But there are certain assignations which require no intimation, such as the endorsement of bills of exchange, adjudication (q. v.), which is a judicial A., and marriage, which is a legal A.; and the same is the rule with regard to all right and estate assigned under the operation of the bankruptcy laws. In Scotch agricultural leases, assignees are generally excluded expressly.

But although A. is the strict Scotch term for assignment, the latter is in Scotland the technical term for the transference of certain property, such as property in copyrights, patents, and registered vessels.

ASSIGNATS. After appropriating to national purposes the land belonging to the church, the French National Assembly (see ASSEMBLY, NATIONAL), instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land *assigned* to the holder. This paper-money consisted chiefly of notes for 100 francs (£4) each, though many of them were for sums as low as ten or five francs, and even lower; and the first issue amounted to 400 million francs. The first A., which were issued in the spring of the year 1790, bore interest; but subsequent issues did not. The facility of this plan of providing government income led to its being repeatedly had recourse to, as the property of wealthy emigrants—persons who abandoned their country in alarm—fell into the hands of the rulers, and was confiscated, till the amount rose to the enormous sum of 45,578 million francs, besides a great number of forged A. manufactured

Fac-simile of Assignat.

d smuggled into the kingdom. The A. naturally soon began to decline, ce once gone, the declension became June 1793, one franc in silver was worth s in paper; in August, it was worth six. ook the most extreme measures to compel ance of A. at their full nominal value. of these were to cause the A. to flow he public treasury, to raise the prices of ities, and to make every one averse to dealings with the state. One of these consequences was attempted to be met by fixing a maximum of prices. But no one could compel producers and dealers to produce and sell at a loss; so that all business became disorganised. At last the value of A. came almost to nothing. Millions of individuals had suffered incalculable loss, and only a few who had bought public lands with the A. that cost them little or nothing, had enriched themselves at the expense of the community. In March 1796, a louis d'or (24 francs) brought 7200 francs in A. After this, they were withdrawn from the currency

in 1796, and redeemed, at $\frac{1}{30}$th of their nominal value, by *mandats*, a new kind of paper-money, which enabled the holder at once to take possession of public lands at the estimated value, while A. could only be offered at a sale. The mandats also soon fell to a seventieth of their nominal value, and were returned to government in payment of taxes or of land.

At length, in July 1796, the system of paper-credit, so obstinately persisted in by government and so disastrous in its results to the public, came to an end. A law was passed, declaring that every one was entitled to transact business in whatever circulating medium he pleased; that the mandats should be taken at their current value; and that the taxes be received either in coin or mandats at that rate. The A. were executed on a coarse kind of paper, and, as will be seen by the accompanying fac-simile, the devices were so meagre as to be easily counterfeited.

ASSIGNEE IN BANKRUPTCY. See BANKRUPTCY.

ASSIGNMENT, in the law of England, is the name given to a conveyance by which the party making the A. transfers or grants over, for a sufficient consideration, a right in expectancy, in reversion, or other right not in possession, such as a bond, a debt, or other *chose en action* (q. v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose en action* by A.; and now the proceeding is in constant practice, the courts of equity, making the rule itself give way to the expediency of facilitating the transfer of property, having directly sanctioned the practice; and even in the courts of common law the application of the ancient principle is evaded. Mortgages may be assigned; indeed the right to make such a transfer is one of the properties of a mortgage security. A. is also the proper mode of assurance or conveyance for passing leasehold estates for years, and other chattel property; and by the 8 and 9 Vict. c. 106, s. 3, it is enacted that all assignments made after the 1st of October 1845, not being an interest which before the passing of the act might have been created without writing, shall be void at law, unless made by deed. But a mere note in writing, if duly signed by the parties, will nevertheless be supported in equity as an agreement, and pass an equitable interest to the assignee. It also appears that a parol or verbal lease for a term not exceeding three years, nor valid as such within the Statute of Frauds (q. v.), may be assigned by a simple note in writing, if impressed with a proper stamp. Copyright is assignable; indeed, by the 5 and 6 Vict. c. 45, s. 3, copyright is expressly given to the author *and his assigns*; but it is not required, like a patent right, to be in every case under the seal of the proprietor, it being enacted by section 13 of the same act that an A. properly entered in the book of registry at Stationers' Hall shall be as effectual as if made by deed.

In regard to the right of A. generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect of the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, is in general under an absolute incapacity to make any transfer of things personal; for, with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she may have possessed at the time of marriage, or subsequently acquired, belong, by the general rule of law, to her husband. There are also some few cases where, in respect of the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an officer of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See Stephen's *Commentaries*, vol. ii. p. 43.

An A. of goods and chattels is frequently made by a Bill of Sale (q. v.). Bills of Exchange (q. v.) and Promissory Notes (q. v.) are assigned by endorsement.

The corresponding term in the Scotch law is *Assignation* (q. v.). But in that system, A. is the legal and technical word for the transference of property in copyrights, patents, and registered vessels.

ASSIGNMENT OF ERROR is the technical statement of certain grounds on which the judgment of a court of law is sought to be reviewed by a higher tribunal; but by the Common Law Procedure Act (15 and 16 Vict. c. 56., s. 152), it is now limited to the case where the defendant in error intends to rely in support of the judgment on the proceeding in error being barred by lapse of time, or by release of error, or other like matter of fact. See APPEAL and ERROR.

ASSIGNS, or, in Scotch law, **ASSIGNEES**, is the legal name given to parties in whose favour an assignment or assignation (q. v.) is made.

ASSIMILATION. See NUTRITION.

ASSINIBOIA, the district round Red River Settlement. It takes its name from the Assiniboine river, as the settlement itself does from the river into which the Assiniboine flows. See RED RIVER SETTLEMENT.

ASSINIBOINE, a river in the Hudson's Bay Territory. Near lat. 50° N., and long. 96° W., it falls from the north-west into the Red River (q. v.), which discharges its waters into Lake Winnipeg.

ASSISI (*Asisium*), a town of Central Italy, is built upon a steep hill, in 43° 5′ N. lat., and 12° 37′ E. long. Pop. 14,033. It stands in a singularly picturesque situation, and is surrounded by a wall flanked with towers, and overhung by a lofty citadel in ruins. It is the birthplace of St Francis, who here founded the Convento Sacro, the first monastery of the Mendicant order that bears his name, a large and beautiful structure, and one of the earliest specimens of the Gothic style of architecture in Italy. The church and the galleries of the monastery contain fine paintings by Cimabue, Giotto, and other old masters. Besides the Convento Sacro, there are eleven other monasteries in A. Of these, the largest is the Portiuncula, which has a richly decorated church, with a cupola by Vignola. In the last century, this place was a great resort of pilgrims visiting the tomb of the saint, of whom one hundred thousand are said to have been assembled here on one day.

And now, by the effect of the statute 15 and 16 Vict. c. 76 (the Common Law Procedure Act, 1852), the course of proceeding is no longer even ostensibly connected with a proviso at nisi prius, but the trial is allowed to take place without the use of any such words in the process of the court, and as a matter of course, before the judges sent under commission into the several counties. The circuit system, however, does not extend to London and Middlesex, which have instead courts of nisi prius, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster Sittings—the times for which sittings are now regulated by the Common Law Procedure Act of 1854 (17 and 18 Vict. c. 125, s. 2); and the establishment of the Central Criminal Court (by the 4 and 5 Will. IV. c. 36, the jurisdiction of which has been recently extended by the 19 and 20 Vict. c. 16), has sufficiently provided for the administration of criminal justice within these districts.

The circuit courts of Justiciary in Scotland, of which there are three—the North, the West, and the South—very much resemble the assizes in England, and have, in criminal matters at least, very much the same jurisdiction; but in civil causes their authority is very limited.

In the sense of an ordinance or law, the term A. has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the 'Assizes' of Jerusalem were, as we are told in Gibbon's *Decline and Fall* (vol. xi. p. 93), a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were the 'Assizes' or ordinances regulating the price of bread, ale, fuel, and other common necessaries of life, but all of which have been abolished. The same regulations appear to have prevailed in Scotland in ancient times. See JURY TRIAL, FAIRS.

ASSOCIATE SYNOD, ASSOCIATE PRESBYTERY, &c., designations adopted among the SECEDERS (q. v.) from the Church of Scotland. There is also an Associate Synod in America, and an Associate Reformed Church, both of which have sprung from the Scottish Secession.

ASSOCIATION. See CO-OPERATION; also, SOCIETIES, LEAGUE, COMPANY.

ASSOCIATION OF IDEAS. This is a phrase of great importance in the Philosophy of the Human Mind, as expressing the most pervading fact at the foundation of our intelligence. By giving, therefore, a somewhat full exposition of this subject, we are able to explain, at once, a considerable number of the complex phenomena of mind in a more satisfactory way than by treating the several phenomena separately. What is meant by Association of Ideas, is familiarly illustrated by such occurrences as the following: When we see the sky becoming overcast, we think of rain as about to follow, the notion of rain not having previously been present to our mind. When we hear the church-bells, we are apt to think of the crowds in the street, or of some of the other circumstances of public worship. When we pass a house, we are reminded of its occupier; and meeting a person we know, we may be carried in thought to his office, and from that to other persons holding the same office, and so on. If an object is before my eyes, as a mountain, I am said to receive an impression or sensation of it, in consequence of the actual presence of the thing; but it is possible for me to remember the mountain, or to have an idea of it, when far away from the reality, in which case there must be some power in the mind itself, different

from the susceptibility to present objects, a power of retaining, reviving, or resuscitating those states at first induced by contact with the actual. Besides the sights, and sounds, and touches caused by contact with real things, we are greatly occupied with sights, sounds, and touches remembered, anticipated, or imagined, which is to live in a world of ideas; and it is in this world that the process termed Association has its sphere. When an idea is brought before the mind without its original, as when I picture to my mind the late Duke of Wellington, the circumstance is owing to the mention of his name, or of some incident connected with him; and my remembrance of his personal appearance, as I have seen him when alive, is said to be the result of an association existing in my mind between two ideas, so that the one is able to recall or restore the other. The association between names and things comprehends one of the most extensive applications of the power in question.

The circumstances under which one idea brings forward another into the view are principally these two—viz., first, previous *proximity;* and second, *likeness.* The terms 'Contiguity' and 'Similarity' are used in Mental Philosophy to express them. The first is exemplified in the examples of association given above; for in most of those it will be found that the conjoined notions have been frequently in the view at the same time, in consequence of which they have, as it were, grown together, or become part of the same whole. Thus, we have often noticed the darkened sky followed by a shower; the two facts have occupied the attention simultaneously, and in virtue of some power belonging to our mental framework, they have cohered into an inseparable couple or aggregate in the mind. This is proximity, or contiguity. When one idea suggests another which was never in company with it before, it is generally through the force of some *likeness* between the two. I meet an old man in the street with a very peculiar face, which reminds me of the bust of Socrates. These two things had never accompanied one another in my mind before, and therefore it could not be the force of proximity that made the second to arise at the instigation of the first; but there was a certain amount of likeness or similarity between the old man's features and the features of Socrates, as represented to us in the bust; and it is a fact of our constitution, no less certain and no less important than the foregoing, that in cases where something now before the mind has a strong cast of resemblance to something formerly observed or conceived by us, but not at present thought of in any way, the present is apt to recall that past idea, whatever it may be. By the force of likeness, the traveller in new countries is constantly reminded of the scenes and objects familiar to him, and so is induced to draw comparisons between the one and the other. Identification and comparison both imply that things are brought together by virtue of their similarity, they not having been in company before. The principle of proximity operates most in Memory, Habit, and Routine; similarity has to do with invention and originality, and is essential to the processes of Reason and Imagination.

Law of Contiguity.—The principle of association by proximity is not confined to ideas. We must state it in a more comprehensive form, in order to comprise the full sphere of its application; for our mechanical habits are formed through the very same power of our constitution that enables us to recall or remember ideas. The taught movements of a soldier or of a skilled workman are connected together so firmly that one succeeds to another almost of its own accord. Everything of the nature of acquisition supposes a plastic property in the human system, giving permanent coherence to acts that have been performed together.

The following is a general statement of the law under consideration:

Actions, Sensations, States of Feeling, and Ideas, occurring together, or in close succession, tend to grow together, or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to arise.

And first, as to association of Actions, or voluntary movements. When we perform a train of movements without any further aid of the will than to commence the series, there must be a fixed connection between each and the one that follows. this connection may be either instinctive or ac There are various cases of instinctive tra as the action of the heart, lungs, and inte the movements of deglutition. When a food reaches the back part of the muscles of the throat seize hold of it to the stomach, independent of connected movements in this case are in the original structure of the nervous lar system. In walking, there is partly an tive tendency to alternate the limbs, and confirming acquisition, the result of practi in those complicated operations that are taught to execute in the various life, the associating principle is e apparently simple and easy act of complicated acquisition; in other sive group of associated movements. the morsel is followed by the movemen that carries it to the mouth; the mouth is simultaneously; after which follow the of biting and chewing; all which take pl the certainty of a machine, and without attention directed to them. These asso originally built up by slow degrees. rule, it takes many repetitions to union between successive and ments as is implied in the above

A good example of the association of is furnished in our acquirement of spok as in committing to memory words, say passages of books. When a child has acquired the Lord's Prayer, the chain of is so firmly knit, that the articulation 'Our Father' is followed irresistibly succeeding, and so on to the end. The case is between the vocal to the enunciation of many times through this stream of nervous power, in some way not at present explain, acquires a te into this one definite track, and in futu on the movements in the exact order tha so frequently followed.

It is not merely actual mov joined together in this way, bu ment; for a man, meditating in speaking out his thoughts, can co so as to remember them afterwards.

When we proceed to Sensations and or subsequent traces, of Sensations, and with these the variety of our movements ideas, we find an unlimited scope for the principle; and the consequen of its spread far and wide in the d of our knowledge, and our acti possible here to present a few

In the various mechanical acqu include the whole of special hand and skill, as well as the use of the in the more general actions of daily life. be traced the linkings of a

rith sensations and ideas. The helmsman a ship associates in his mind each deviation edle from the proper point with the specific exertion to be applied to the wheel to e ship's direction. The workman fabricat- od, metal, or stone, acquires a firm connec- ween each aspect of the material and the nower to be applied to bring it one step desired form. The power of copying e see, as in writing, drawing, moulding, completely mastered, is made up of asso- between a visible appearance, and the train calculated to reproduce it. After is done, as it is called, mechani- hout those operations of considering, remembering directions, that are essen- learner in a new art. The associations up after a certain amount of practice, are ese associations between movements and as to the eye, or sensations of sight. In number of crafts, the eye is the guid- the operator, but not in all. Some- t is vocal, as in performing music, and ing musical instruments, in speak- , the touch is the guiding sense, as in cookery, the taste and smell direct r. ailed exemplification of ible ture might be given thr f the human intellect.

of speech, as already said, contain a wide range of instances. The adhesion of language is partly in the vocal organs, partly in the ear, and partly in the eye, when we come to written and printed characters. The associations of names with things, with actions (as in obeying direction and command), and with other names (in acquiring foreign languages), are a gradual growth favoured by such conditions as the above. The acquirements in Science, Fine Art, and Business, and in everything that constitutes skill or knowledge, proceed upon this plastic property of the mind. It also enlarges the sphere of our pleasures and pains. There are connections established in the mind between our states of feeling and the things that have often accompanied them, so that the accompaniment shall have power to revive the feeling. It is thus that we contract affections, both benevolent and malevolent, towards persons and things, our friends, our home, our country, our property, our pursuits.

This power of stirring up dependent associations to an extent that may be almost called unlimited (although there are limitations), is peculiar to the animal organisation. Nothing parallel to it occurs in the mineral or vegetable world. It is a property of mind alone, and has its seat in the nervous tissue. We know that growth or change is requisite to the process of the adhesion; for it proceeds most rapidly in youth, health, and nutrition, and decays in old age, and during exhaustion and disease. And even to keep our acquisitions from fading away, it is requisite that they should be occasionally revived. A language acquired in early years may be utterly lost by disuse. Constant practice seems particularly necessary in early childhood; children's acquisitions are very liable to deteriorate, if not kept up and confirmed by new additions.

Law of similarity.—This may be expressed as follows:

Present Actions, Sensations, Thoughts, and Emotions tend to revive their Like among previous impressions.

If the mind worked only by the principle of contiguity, nothing would ever occur to us except in some connection already formed. But some explanation is necessary as to the precise relationship subsisting between the two distinct forces of mental resuscitation, in order to shew at once their distinctness and their connection. When the cohesive link between any two contiguous actions, sensations, or ideas, is confirmed by a new occurrence or repetition, it is perfectly obvious that the present impression must revive the *sum total* of the past impressions, or reinstate the *whole mental condition* left on the occasion immediately *preceding*. Thus, if I am disciplining myself in the act of drawing a round figure with my hand, any present effort must recall the state of the muscular and nervous action, or the precise bent acquired at the end of the previous effort, while that effort had to restore the condition at the end of the one *preceding*, and *so on*. But this reinstatement of a former condition by a present act of the same kind, is really and truly a case of the principle before us, or of like recalling like; and without such recall, the progressive adhesion of contiguous things would be impossible. It would appear, therefore, that similarity is tacitly assumed in the operation of contiguity, and is indispensable to the process by which our acquisitions are gradually built up. Why, then, do we set up the associating force of likeness as something independent and distinct? To answer this question, we must advert to the fact, that in those cases where the same impression is deepened by every new repetition, the old and the new are not merely similar, they are *identical*, and the resuscitation takes place without fail, and

as a matter of course. But in going deeper into the explanation of the human intellect, we encounter many classes of similars, where there is not absolute identity, but the mixing up of a certain amount of *diversity* with the likeness actually existing. The botanist classing together all the plants of the same order, as, for example, the *Rosaceæ*, has to be struck with the occurrence of certain common characters—viz., the properties that distinguish the order—in the midst of great varieties in all other respects. It is important that he recognise these general marks, whether the plants be trees or shrubs, whether they be poisonous or wholesome, and under many other diversities. It is exceedingly important in science, in the business of life, and even in the creations of fine art, that the mind should take cognizance of likeness surrounded by unlikeness; which is the case that renders it necessary to characterise as distinct the associating force now under discussion. In the case of perfect identity between a present and a past impression, the past is recovered, and fused with the present, instantaneously and surely. So quick and certain is the process, that we lose sight of it altogether; we are scarcely made aware of the existence of an associating link of similarity under such circumstances. But when we pass from perfect to imperfect or partial identity, we are more readily led to perceive the existence of this link of attraction between similars, for we find that the restoration sometimes does not take place; cases occur where we fail to be struck with a similitude: the spark of resuscitation does not pass between the new impression and the old dormant one. Then it is that we recognise differences between different minds; one man tracing resemblance and making out identity better than another. Moreover, we can assign reasons connected with the culture of the individual, which partially explain superiority or inferiority in this important faculty; just as we have pointed out the conditions favourable to the rapid growth of the adhesive bond of proximity. The failure in reinstating an old impression by virtue of a present one like it, is solely ascribable to the want of perfect identity. When in some new presentation of an object, the old familiar form is muffled, obscured, distorted, disguised, or in any way altered, it is just a chance if we recognise it; the amount of likeness still remaining will have a tendency to revive the object, while the points of difference or unlikeness will operate against the revival, and tend to restore things of their own kindred. If we hear a musical air that we are accustomed to, the new impression revives the old as a matter of course; but if the air is played with complex harmonies and accompaniments which are strange to us, it is possible that the effect of these additions may be to check our recognition of the melody; the unlike circumstances may repel the reinstatement of the old experience more strongly than the remaining likeness attracts it. If our hold of the essential character of the melody is but feeble, and if we are stunned and confounded by the new accompaniments, there is every probability that we shall not be put upon the old mental track made by the same air; in other words, we shall not identify the performance.

A few examples may next be given, to shew the workings of this associating power, and the consequences thence arising. The intellectual operations known under the names Classification, Generalisation, Induction, and Deduction, all proceed upon the discovery of likeness among things lying wide asunder in space and time, and very often veiled by diversity. Thus, in order to include in one list all the species of the *rose*, botanists have had to trace the characters of the genus through its various members, wherever they occur, and under the greatest differences in every other respect. It takes a keen identifying faculty—that is, a strong natural tendency for the resurrection of like to meet like—to see the resemblance of some of these species to the rest; and it has happened in many departments of knowledge that a class has remained incomplete for a time, purely from the disguised character of some of the individuals. So in the process termed *induction*, by which a general law is arrived at by comparing instances of it everywhere, there must be an attraction of similars, in order to bring together in the mind the collection of particulars that the induction is based upon. Thus, Newton assembled in his view the various transparent bodies that he had found in the course of his experiments to refract or bend light strongly, his only intellectual instrument for doing so being the bond of likeness operating as a power of recall. Having looked at them in company, he saw that some were remarkable for their weight or specific gravity, and others for containing inflammable ingredients; upon which he raised the general induction, connecting these two properties with high refrangibility. Then, *deductively*, he applied the generalisation to the diamond, which refracts light more than any other known substance; and as it is not a heavy material, he extended the other inference to it—namely, that it was made up of some inflammable material, an inference afterwards confirmed by the discovery that it is crystallised carbon. Many of the greatest discoveries in science have turned on the identification of modes of action never before supposed the same, as when Franklin was struck with the resemblance between the atmospheric thunder and lightning and the phenomena of common electricity.

Another wide field for the operation of the same principle, is the region of *illustrative comparison*, whereby two things widely remote are brought together, in the view either to elucidate one another, or for the sake of ornament and poetic effect. Most men of genius in literature and poetry have contributed original illustrations, similes, metaphors, or comparisons in the course of their compositions. Shakspeare carries the palm in this faculty. The writings of Bacon are remarkably rich in those that serve the purpose of exposition. Science is with him the 'interpretation' of nature: final causes are 'vestal virgins;' they have no fruit: fallacies are 'idola.' Edmund Burke, another master of illustrative comparison, has termed revolutions the 'medicine' of the state, and regular government its 'food.'

If we inquire into the circumstances that render one mind more prolific in new identifications and comparisons than another, apart from difference of original capacity, we must refer mainly to the fact, that the one has had the greater previous familiarity with the class of things thus brought up by the attraction of similarity. A mathematician is the most likely person to bring up comparisons from mathematics; a botanist is prepared to identify plants; a travelled man provides illustrations from foreign countries; a historian, from history. The sailor is notoriously rich in nautical similes and illustrations. When any one not specially versed in a subject is yet prone to draw upon it profusely in the way of comparison, we must then refer to great natural endowment as the sole explanation. But our space does not allow us to dwell further on the subject. (For the full exemplification of both the associating principles and of the complications that they give birth to, see Bain on *The Senses and the Intellect*.)

ASSU'MPTION, a village and river of Lower Canada. About 8 miles below the village, the river flows into the St Lawrence, or rather into the Ottawa, nearly opposite to the lower extremity of the island of Montreal.—A., or Asuncion, is also the name of the capital of Paraguay, on the left bank of the river of that name. It has a population of 17,890, and has a trade in hides, tobacco, timber, wax, and Paraguay tea. The city was founded in 1535 by the Spanish, and soon became a place of importance, though not of beauty, being ill built, dirty, and disagreeable. The surrounding country is rich in pastures, and also produces crops of wheat, maize, sugar, tobacco, honey, wax, &c.

ASSU'MPTION OF THE VIRGIN MARY. A festival of the Romish Church. In the 7th c., the idea originated that the soul and body of the Virgin had been carried up to heaven by Christ and his angels. The Roman Catholic Church, therefore, has, ever since that period, kept the 15th of August in memory of Mary's translation into glory; although, from the 4th c. until then, it had kept the same day in memory of her death. Liguori, in his *Glory of Mary*, gives a very minute account of the circumstances of her Assumption.

ASSU'RANCE. See ISSURANCE.

ASSURANCE, COMMON, is described by Blackstone as the legal evidence of the translation of property, whereby every man's estate is assured to him, and all controversies, doubts, and difficulties are either prevented or removed. For an account of these common assurances or *conveyances*, as they are generally termed, see DEED and CONVEYANCE.

A'SSYNT, a mountainous, moorish, and very rugged district or parish, 25 miles long, and 15 broad, in south-west Sutherlandshire. It mostly consists of a net-work of rocky heights, interspersed with a multitude (200) of dark, motionless tarns or pools, of various sizes, with some larger lochs, the largest, Loch Assynt, being 10 miles long and 1 broad. The district consists of gneiss, Silurian rocks, and primitive limestone. There are a dozen mountains 3000—3500 feet high. Some of the mountains are covered with white bleached stones and protruding rocks like patches of snow. The mountains have frequently the form of artificial pillars and cairns, and are the remains of an enormous denudation of the nearly horizontal strata of the district. Suil Veinn is a perfect sugar-loaf, towering nearly 2000 feet above a rugged table-land of gneiss hills, 800 to 1000 feet above the sea. In Advreck Castle, on a promontory on the east side of Loch A., the famous Marquis of Montrose was confined in 1650.

ASSY'RIA (called Athura on Persian cuneiform inscriptions, and Assura on the Median) was the northernmost of the three great countries that occupied the Mesopotamian plain. It was bounded on the N. by the Niphates Mountains of Armenia; on the S., by Susiana and Babylonia; on the E., by Media; and on the W., according to some, by the Tigris, but more correctly by the water-shed of the Euphrates, for many Assyrian ruins are found to the west of the Tigris. It was thus about 280 miles long from north to south, and rather more than 150 broad from east to west. This plain is diversified by mountain-chains on the north and east, and watered by the Tigris and its affluents, between two of which - the Zab rivers - lay the finest part of the country, called Adiabené. As it was the boundary-land between the Semitic people and Iran, it became the scene of important political events. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity

and civilisation reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the many proofs—furnished by recent excavations—of an acquaintance with the arts and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekrit to Bagdad. Under the Mohammedans, this fine country is now almost a desert.

History.—Ancient authorities differ widely from each other respecting the rise and progress, the extent and the duration, of the Assyrian empire. Ctesias, a Greek of Cnidus, court-physician to Artaxerxes Mnemon, is quoted by various ancient writers; and his information, though utterly incredible and fabulous, has been followed by most classical historians, and by the whole series of ecclesiastical writers. Many ingenious but futile attempts have been made to reconcile his history with the Scripture narrative. Berosus, a priest of Bel at Babylon, who wrote about 268 B.C., and Herodotus, differ widely from Ctesias, but are confirmed in many important particulars by the Bible, and by the continually increasing evidence derived from cuneiform inscriptions.

In the Bible narrative, we are told that Nineveh was founded by Asshur from Babylon (Gen. x. 11). The latter city, therefore, must have been the capital of a more ancient empire, as Berosus asserts, and recent discoveries go far to prove, though Greek writers maintain the reverse. The next notice we have of A. does not occur till 770 B.C., when Pul, king of A., invaded Palestine, but was bought off by Menahem, king of Israel. Tiglath-pileser, who succeeded Pul (738 B.C.), conquered Syria, and carried off many of the Jews into captivity. Next, Salmanezer (730 B.C.) subdued Israel, which, at the instigation of the Egyptians, had refused to pay tribute. The next is Sennacherib (713 B.C.), who attacked Egypt, and threatened Judah under Hezekiah. He was slain by his two sons, and succeeded by his son Esarhaddon, who was also master of Babylon (2 Chron. xxxiii. 11), which, under Nabonassar, had been independent of Nineveh since 747 B.C. Very little credit is to be attached to the expedition of Holofernes recorded in the book of Judith.

After this, the empire appears to have gradually decayed, until at last, in the reign of Sardanapalus II., or Saracus, a league was formed for its destruction between Nabopolassar, governor of Babylon, and Cyaxares, king of Media, which was strengthened by the marriage of Nebuchadnezzar, son of the former, to Nitocris, daughter of the latter. The war and siege are said to have been interrupted by an invasion of the Scythians, which drew off Cyaxares; but at length Nineveh was taken and destroyed about 606 B.C., or, according to Rawlinson, 625. In the time of Darius Hystaspes, A. rebelled without success in conjunction with Media. In the time of Herodotus, the capital had ceased to exist; and when Xenophon passed it, the very name was forgot, though he testifies to the extent of the deserted city, and asserts the height of the ruined walls to be 150 feet. An inconsiderable town seems to have existed on its ruins in the reign of Claudius; and the last notice we have of Nineveh in the classics is in Tacitus.

According to the Greek legends, the Assyrian empire was founded by Ninus. To this monarch and his consort Semiramis are ascribed expeditions on an incredibly magnificent scale against Bactria, Ethiopia, and India. We are told that Semiramis led an army of 3,000,000 infantry, 500,000 cavalry, and 100,000 chariots, and a fleet of 2000 ships, and was encountered by forces more numerous still, and defeated; that she returned to Nineveh, where she soon afterwards died, and was reckoned among the gods, and was succeeded by her son Ninyas, an effeminate prince. The succeeding part of the history as related by Ctesias is equally false, though that writer managed to make the ancient world give credit to his narrative in preference to that of Herodotus. He gives a list of monarchs from Ninus to Sardanapalus, which is now considered to be a clumsy forgery. According to him, for thirty generations after Ninyas, the kings led a life of luxury and indolence in their palace; the last of them, Sardanapalus, made a vigorous defence against Arbaces, the rebel governor of Media, but finding it impossible to defend Nineveh, he set fire to his palace, and burnt himself with all his treasures; this event took place 1306 years after Ninus. ). No record has as yet been dis-

covered of this expedition against Palestine. His edifices are not inferior to those of his predecessors. He employed Greek and Phœnician artists, and to them probably we owe the beautiful bas-reliefs that adorn the edifices of his erection. The decline of the empire probably commenced with Asshur-banipal II. The arts of peace flourished, while the military vigour of the nation declined. The sculptures of this reign are decidedly superior to the earlier in spirit, delicacy, and freedom from conventionality. The slabs shew that hunting, not war, was this king's favourite pursuit. He was succeeded by his son Asshur-emit-ili, the last king of whom any records have yet been discovered. It is uncertain whether Nineveh was destroyed under him, or under a successor, the Saracus of Berosus, the effeminate Sardanapalus of the Greeks. The character usually given of this last king, as a debauchee throwing off his indolent habits, and after performing prodigies of valour, perishing by a glorious death, rather than surrender, is derived solely from Ctesias. All we distinctly know is that, finding himself betrayed to the Median king by Nabopolassar, governor of Babylon, he set fire to his palace and perished in the flames.

We may here note a singularly important cuneiform discovery made by Mr George Smith of the British Museum, and the substance of which was made public at a meeting of the Biblical Archæological Society in December 1872. While engaged on an examination of the collection of Assyrian tablets in the British Museum, Mr Smith lighted upon a curious series of legends, including a copy of the story of the Flood. On discovering these documents, which were much mutilated, he searched over all the collections of fragments of inscriptions, consisting of several thousands of smaller pieces, and ultimately recovered 80 fragments of these legends. The tablets were originally at least 12 in number, forming one story or set of legends, the account of the Flood being on the 11th tablet. Of the inscription describing the Flood, there are fragments of three copies, containing duplicate texts. These texts belong to the time of Asshur-bani-pal (circa 660 B.C.), and were found in the library of that monarch in the palace at Nineveh. The original text, according to the statements on the tablets, belonged to the city of Erech, and appears to have been either written in or translated into the Semitic Babylonian at a very early period. Mr Smith is of opinion that its composition cannot be placed later than the 17th c. B.C., while it may be much older. The Assyrian story of the Deluge is both like and unlike the Scripture narrative. The Flood is sent as a punishment for sin; the builder of the ark is called Sisit (the *Xisuthrus* of the Græco-Chaldæan Berosus); he gathers into the vessel all his male and female servants, all the sons of the army, and all the beasts of the field; the storm of rain lasts only six days, and yet submerges the whole earth; all life is destroyed; Sisit sends forth a dove which can find no resting-place, and returns; then a swallow, which is also forced to return; then a raven, which does not come back. The ark rests on a mountain, the animals are liberated, an altar is built by the grateful patriarch, and Bel, the Great God, makes a 'covenant' with Sisit. The minuter details of this Assyrian legend diverge greatly from the Hebrew account, and lead to the conclusion that in each we have an independent tradition of some great natural catastrophe in the early ages of human history. Mr Smith notices that the Biblical narrative is the version of an inland people; the name of the ark in Genesis means a chest or box, and not a ship; there is no notice of the sea or of launching, no pilots are spoken of, no navigation is mentioned. The

inscription, on the other hand, belongs to a maritime people; the ark is called a ship, the ship is launched into the sea, trial is made of it, and it is given in charge to a pilot. This seems to point to the Persian Gulf as the birthplace of the old legend. Mr Smith is of opinion that, 'beneath the mounds and ruined cities of Chaldæa, still awaiting exploration, lie, together with older copies of this Deluge text, other legends and histories of the earliest civilisation of the world.' Mr Smith returned in 1874 from a lengthened exploration of the Chaldæan ruins, and gave an account of his valuable discoveries in a work entitled *Assyrian Discoveries* (1875).

Government.—The government was despotic, as suited the character of the people. The empire was a mere congeries of kingdoms bound to the supreme authority only by certain obligations of paying tribute, giving presents, and shewing due respect. Each kingdom retained its own rulers, laws, and religion, although we do find some attempts to rule by satraps and collectors of tribute. Tiglath-pileser also boasts, in an inscription, of having punished and crucified the Chaldæans who refused to worship his gods. In consequence of this imperfect organisation, the empire was exposed to frequent revolts of the subject nations, when such opportunities offered as a disputed succession, or want of energy in the ruling prince. Then the labour of conquest had to begin anew, and it was sought to diminish the danger of the central power by inflicting severe punishments on the rebels. The history of the Jews has made us familiar with one of these devices—viz., the wholesale deportation of the inhabitants of the offending district. It may be readily believed that such an empire, though imposing from the magnificence and wealth of the capital, yet, from the impoverishment and weakness of the subject states, was continually liable to fall to pieces, and was ill fitted to resist an attack from without. That A. did actually last for five centuries, was owing to a long succession of warlike princes, and to the energy of the population.

Religion.—The religion of the Assyrians was nearly identical with that of the Babylonians. It was a gross polytheism, their gods being thousands in number, and each village having its own particular deity. From thousands of theological tablets now in the British Museum, it is known that each divinity had many names, and some of them as many as fifty titles besides. Again, many deities that are prominent in the Babylonian pantheon are either unknown or occupy a subordinate position in the Assyrian. Besides, the same gods did not remain equally popular throughout. The supreme god was Asshur, probably the deified patriarch. His worship was confined to Assyria. He is generally associated in the inscriptions with *Nin* and *Nergal* (2 Kings xvii. 30), who are represented by the man-bull and the man-lion. The winged globe, so often seen in the sculptures, from which a figure with a horned helmet shoots his arrows, is supposed to be the emblem of Asshur. Next in rank is the governing triad, answering to the Pluto, Jupiter, and Neptune of the classical mythology; the next group corresponds to Æther, the sun and the moon; then five inferior deities, representing the five planets. Each god is associated with a goddess. Mylitta, or Beltis, is the 'queen.' The male and female powers of the sun are represented in the Scripture phrase, 'Adrammelech, and Anamelech, gods of Sepharvaim'—that is, of Sippara, a town a few miles above Babylon. *Bel-merodach* was originally an inferior deity, son of Hea, the fish-god; but under the later Babylonians, we find him monopolising the greater part of the homage which used previously to be divided among several. Nisroch (2 Kings xix. 37) has not been yet ascertained. Nebo (Isaiah xlvi.) is one of planetary gods, and corresponds to Mercu systems of notation, divisions of time, the pla stars, animals and metals, divination and a were all more or less closely connected with t

Ethnology.—The Assyrians have been ass some ethnologists to the Aryan race, but it generally acknowledged that they were a b the Semitic family of nations, and the members of the same grand division of the as the Syrians, the Phœnicians w the Jews, and the modern Arabia... as e c. A'STACUS. See CRAYFISH and LOBSTERS.

ASTA'RTÉ (styled Ashtaroth in the Old Testament), the name of the chief female deity of the Phœnicians, Carthaginians, and Syrians (Syria Dea), also worshipped by the Jews in times when idolatry prevailed. A. was the original from which the Greeks borrowed their Aphrodite (q. v.). As Baal was god of the sun, A. was goddess of the moon. Her chief temples were in Tyre and Sidon. According to ancient accounts, her worship was of a licentious character. The oldest known image of her —that in Paphos—represented her simply under the form of a white conical stone. In Canaan and Phœnicia she was subsequently typified under the form of a cow, or sometimes she had only a cow's or bull's head; still later, her emblem became a star; and finally, she was conceived of as the 'queen of heaven,' sitting on a lion, her head surrounded with rays, and in the one hand a thunderbolt, in the other a sceptre.

ASTA'RTÉ, a genus of Mollusca, with bivalve shells, the type of a family *Astartidæ*, very closely allied to the *Veneridæ* or Venus family. It is interesting chiefly with reference to geologic changes and the history of life and organisation, because only a few species seem now to exist, and these limited to the North Atlantic and Arctic Oceans, whereas the fossil species are extremely numerous, commencing with the *lias* period, and distributed over the whole world. The Astartidæ may be regarded as having given place to the Veneridæ, which commenced with the oolitic period, and are among the most abundant bivalve mollusca of the present time.

A-STAY', the position of an anchor when, during heaving, the cable forms an acute angle with the surface of the water.

A'STER (Gr. a star, from the form of the flowers), a genus of plants of the natural order *Compositæ*, which Lindley has therefore chosen to call *Asteraceæ*. The ray and the disk are of different colours. The genus contains a great number of species, both herbaceous and shrubby, which have been arranged into six or seven groups, regarded by many as distinct genera. One species only, *A. Tripolium* or *Tripolium vulgare*, the Sea Starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New-England A. (*A. Novæ Angliæ*) and the Michaelmas Daisy (*A. Tradescanti*), both natives of North America, are perhaps the most common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China A. (*A. Chinensis*), a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China in the earlier part of the 18th c. The varieties exhibit great diversities of form and colour. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the

young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden.—*A. argophyllus*, or *Haxtonia argophylla*, is a shrub, a native of Van Diemen's Land, smelling strongly of musk. The whole plant has a whitish aspect. It grows to a considerable size, but succeeds in the open air only in the very south of England.

ASTERABA'D. See ASTRABAD.

ASTE'RIAS AND ASTERI'ADÆ. See STAR-FISH.

A'STERISK (Gr. a little star), a sign or symbol (*), used in writing and printing either as a reference to a note at the bottom or on the margin of the page. The obelisk (q. v.), or dagger (†), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, &c. The A. and other similar signs may have any arbitrary meaning assigned to them at the will of the writer, an explanation being previously given what the signification is to be. The Greek grammarians, or critics, used the A. to mark a passage that had been unjustly suspected, but was to be held as genuine, or a passage in any way remarkable; the obelisk, again, marked an interpolated or an objectionable word or passage.

ASTEROI'DS. See PLANETOIDS.

ASTEROPHY'LLITES (Gr. *aster*, a star, and *phyllon*, a leaf), a generic name, under which are included many of the most abundant fossil plants of the coal-measures. The leaves are arranged in a stellated manner around the stems or branches. The A. are ranked among the exogenous or dicotyledonous fossils, but they are of doubtful affinity, and the exact determination of their place in the system has not yet been accomplished.

A'STHMA is a disease characterised by the breathing, previously natural, becoming difficult, and accompanied by wheezing and a distressing sense of tightness in the chest. A. generally appears at first after some inflammatory affection of the respiratory mucous membrane, and more especially in those who have led dissipated lives. In others, it is clearly hereditary, and frequently affects several members of the same family. A. may be habitual, or may occur in spasms, generally preceded by some premonitory symptoms, as in some by great drowsiness; others, says Dr Hyde Salter, 'know by extreme wakefulness and unusual mental activity and buoyancy of spirits; and I knew one case in which an attack of ophthalmia occurred.'

The spasms may occur at any hour; but in nineteen out of twenty cases they waken the patient from sleep between three and four in the morning. The horizontal position facilitating the flow of blood to the right side of the heart, and therefore to the lungs, the disadvantage at which the muscles of respiration are placed, and the greater readiness with which sources of irritation act during sleep, explain this fact.

Persons subject to A. scarcely dare fall asleep after any imprudence in diet; if they continue awake till their supper is fairly digested, and the stomach empty, they may go to sleep fearlessly, and have a good night's rest. The asthmatic paroxysm is thus described by Dr Salter, the latest authority on this common but terrible disease: 'The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze, so as to waken those in adjoining rooms. He awakes, changes his position, falls asleep again and again, and the miserable fight between A. and sleep go on, till the increased suffering does not allow patient longer to forget himself for a moment becomes wide awake, sits up in bed, throws h forward, plants his elbows on his knees, and fixed head and elevated shoulders, labou breath like a dying man.'

If the spasm is protracted, the oxygenat blood is imperfectly performed, owing to supply of air, and his extremities get c but at the same time the violent respiration cover him with swea always small. The muscles of the attached to the ribs, act as extraor of respiration. The chest enlarge paroxysm, but in it there is almost tion of air. The respiratory tubes all small, and the parts at which they are so constr are constantly shifting.

The remedies for A. are numerous, but not depended on. They consist in paying attenti the digestive system, and in anti-spasmodics, taken internally or by inhalation.

A'STI (*Asta Pompeia*), a city of Pi government of Alessandria, lies on of the Tanaro, on the railway from T 26½ miles E.S.E. of Turin. Pop. It is a large town, with walls considerably and the streets generally very narrow an It is the seat of a bishop, and has a co and a royal college. There is carried on able trade in silk and woollen fabrics, le hats, as well as in wines and agricultura A. is a town of high antiquity, having been for its pottery before its capture by the G 400 B.C. On the occasion of its being and destroyed in an irruption of G rebuilt by Pompey, and received Pompeia. In the middle ages, A. most powerful republics of Upper captured and burnt by the Emperor 1155; and after a series of vicissitudes the possession of the Visconti of Naples, it was ceded to the French, in whose remained till the middle of the 16th c came into the possession of the Dukes of it still remains. Alfieri was born here, district of Asti, one of the six subdivisions government of Alessandria, is bounded on and N. by the province of Turin, S. by by Alessandria Proper, and N.E. by the Casale. The surface is hilly and picturesoil rests upon limestone abounding in fo fertile, producing corn, fruit, and wine. brated for a fine white wine resembling called *vino d'Asti*. Silk is one of its most ant products.

ASTON, LUISE, a German authoress of note, but principally known for her zeal in of the 'rights of women.' She was born ab in the vicinity of Halberstadt, and at an was married to a wealthy English man Their union was not happy; perhaps her views of society and of the proper position sex contributed to the estrangement of their thies. After separating from her attracted public attention, especially appearing on the streets in man's dr cigars, &c. This conduct brought collisions with the police, and she wa to leave the city. During the Slesvig however, she found a nobler sphere for nature, and displayed the greatest her self-sacrificing devotion as an hospital n has written various books, the principal are

the most ancient forms of superstition,
prevailing among the nations of the East
Chaldæans, Hindus, Chinese) at the very
ory. The Jews became much addicted
e captivity. It spread into the West and
nt the beginning of the Christian era.
Astrologers played an important part at Rome, where they were called Chaldæans and Mathematicians; and though often banished by the senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet Manilius, author of an astronomical poem still extant, was addicted to A.; and even Ptolemy the astronomer did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardour by the Arabs from the 7th to the 13th c. Some of the early Christian fathers argued against the doctrines of A., others received them in a modified form. In its public capacity, the Catholic Church several times condemned the system; but many zealous Catholics, even churchmen, have cultivated it. Cardinal d'Ailly, 'the Eagle of the doctors of France' (died 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge might have been predicted by A. For centuries the most learned men continued devoted to this delusive science; Regiomontanus, the famous mathematician Cardan, even Tycho Brahé and Kepler could not shake off the fascination. Kepler saw the weakness of A. as a science, but could not bring himself to deny a certain connection between the positions ('constellations') of the planets and the qualities of those born under them. The Copernican system gave the deathblow to A. When the earth itself was found to be only one of the planets, it seemed absurd that all the others should be occupied in influencing it. The argument has really little force, but it produced the effect. Belief in A. is not now ostensibly professed in any Christian country, though a few solitary advocates have from time to time appeared, as J. M. Pfaff in Germany, *Astrologie* (Bamb. 1816). But it still holds sway in the East, and among Mohammedans wherever situated. Even in Europe the craving of the ignorant of all countries for divination is still gratified by the publication of multitudes of almanacs containing astrological predictions, though the writers no longer believe in them.

Many passages of our old writers are unintelligible without some knowledge of astrological terms, numbers of which have taken root in the language. In the technical rules by which human destiny was foreseen, the heavenly *houses* played an important part. Astrologers were by no means at one as to the way of laying out those houses. A very general way was to draw great circles through the north and south points of the horizon, as meridians pass through the poles, dividing the heavens, visible and invisible, into twelve equal parts—six above the horizon, and six below. These were the twelve houses, and were numbered onward, beginning with that which lay in the east immediately below the horizon. The first was called the house of life; the second, of fortune, or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death, or the upper portal; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies, or of captivity. The position of the twelve houses for a given time and place—the instant of an individual's birth, for instance—was a *theme*. To construct such a plan was to *cast* the person's nativity. The houses had different powers, the strongest being the first; as it contained the part of the heavens about to rise, it was called the *ascendant*, and the point of the ecliptic cut by its upper boundary was the *horoscope*. Each house had one of the heavenly bodies as its *lord*, who was strongest in his own house.

ASTRO'NOMY (Gr. *astron*, a star, *nomos*, a law)

colder parts of the Old World, shrubby, and often spiny, or unarmed and herbaceous. A number of the shrubby species yield the substance called Tragacanth (q. v.), or Gum Tragacanth.—*A. Boëticus*, an annual, native of the south of Europe, with upright branching stems, is cultivated in Hungary, Germany, and other parts of Europe, for its seeds, which are roasted, ground, and used as a substitute for coffee, or mixed with it to improve its flavour.—The Sweet Milk-vetch, or Wild Liquorice (*A. glycyphyllos*), a native of Britain and other parts of Europe, perennial, with long and very thick roots, which penetrate deep into the soil, and almost prostrate stems, three feet in length, is occasionally cultivated for food of cattle, yielding a very abundant herbage. Cattle are not fond of it at first, but are said to become fond of it after being accustomed to it for some time. The roots have somewhat of the sweetness of liquorice.

ASTRAKHA'N, originally a province of the Mogul empire, but united with the Russian empire in 1554. At present, A. forms one of the south-east governments of Russia in Europe, and is bounded on the S. by the Caspian Sea and the Caucasus; on the W., by the country of the Don Cossacks; on the N., by the government of Saratov; and on the E., by Orenburg. Area, 50,000 sq. m.; pop. (1867) 319,278. The province of A. is almost entirely a barren waste, the only fertile portions being the banks of the Volga, which divides the province into two equal parts. Salt is procured from the marshes of the steppes, considerable numbers of cattle are reared, and the annual value of the sturgeon-fishing in the Volga is as much as 2,500,000 rubles (about £400,000). The climate varies from 70° F. in summer, to 13° in winter. The population is composed of diverse elements—Russian, Tatar, Georgian, Armenian, Bokharese, Persian, and Hindu.

ASTRAKHA'N, the chief town of the government of the same name, is situated on an island of the Volga, and near the Caspian Sea, in lat. 46° 21′ N., and long. 48° 4′ E. It is the seat of a Greek archbishop and an Armenian bishop; has thirty-seven Greek, two Roman Catholic, one Protestant, and two Armenian churches; fifteen mosques, an Indian temple, a gymnasium, a seminary for priests, a botanical garden, and many manufactories. Pop. (1867) 47,839. The houses are mostly of wood, and irregularly built. The fisheries in the Volga supply occupation to great numbers of the inhabitants of A. and its neighbourhood. The principal exports are leather, linen and woollen goods, salted sturgeon, caviar, and isinglass. Imports consist chiefly of gold-embroidered silken goods from Persia, silk stuffs, woollen goods, rice, rhubarb, raw silk, drugs, &c. From July to October, the neighbourhood of A. is frequently visited by swarms of locusts.—A. is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

A'STRAL SPI'RITS. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine, that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, A. S. are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented, according to the notion formed of their nature. As the belief in spirits witchcraft reached its height, in the 15th c., demonologists, or special students of this subj systematised the strange fancies of that wild per and A. S. were made to occupy the first rank am evil or demoniacal spirits. Paracelsus, however, others attributed to every human being an ast spirit, or sidereal element, in which the human so or spirit proper, is thought to inhere, and which li for a time after the person dies.

ASTRI'NGENTS, medicines employed fo purpose of contracting the animal fibres and cl so as to check fluxes, hæmorrhage, The drugs most commonly used as catechu, oak-galls, rhatany-root, &c. vegetable A. owe that property, in w part, to tannin. A severe degree powerful astringent.

ASTROCA'RYUM (from t Gr. and *karyon*, a nut), a genus of l sixteen species are known, America, remarkable for the abun and formidable spines—in some cases, a with which almost every part—stem, l and fruit-stalk—is armed. They have pinnated leaves; some of them are lofty, of very moderate height, as 8—15 feet, w are almost or altogether stemless. The fru species is eatable—a juicy pulp covering a seed—as the fruit of the MURUMURÚ pal *Murumuru*), the pulp of which is said to re a melon in flavour, has a sort of musky odo is highly esteemed. It is a palm of only about feet high, abundant about Pará and elsewher the Amazon. Cattle roam the forests in que its fruit, and swine fatten on the seed, which crush with their teeth, although to break it req a smart blow of a hammer, and in h

ation.

ASTROLABE (from two Greek words signifying 'stars'), the name given by the Greeks lar instrument for observing the stars. s, arranged as in the Armillary sphere used for this purpose. A projection of pon a plane, with a graduated rim and king altitudes, was known as an A. in ays of astrology, and was the badge of r. The A. has been superseded by the instruments of modern astronomy.

ASTROLOGY meant originally much the same , 'the knowledge of the stars,' but was restricted to the science of predicting s, especially the fortunes of men, from of the heavenly bodies. This was con- igher, the real science; while the mere f the stars themselves, their places and nomy), was, till a very recent period, ostly with a view to (judicial) astrology. the most ancient forms of superstition, prevailing among the nations of the East Chaldæans, Hindus, Chinese) at the very ery. The Jews became much addicted a ity. It spread into the West and beginning of the Christian era. Astrologers played an important part at Rome, where they were called Chaldæans and Mathematicians; and though often banished by the senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet Manilius, author of an astronomical poem still extant, was addicted to A.; and even Ptolemy the astronomer did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardour by the Arabs from the 7th to the 13th c. Some of the early Christian fathers argued against the doctrines of A., others received them in a modified form. In its public capacity, the Catholic Church several times condemned the system; but many zealous Catholics, even churchmen, have cultivated it. Cardinal d'Ailly, 'the Eagle of the doctors of France' (died 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge might have been predicted by A. For centuries the most learned men continued devoted to this delusive science; Regiomontanus, the famous mathematician Cardan, even Tycho Brahé and Kepler could not shake off the fascination. Kepler saw the weakness of A. as a science, but could not bring himself to deny a certain connection between the positions ('constellations') of the planets and the qualities of those born under them. The Copernican system gave the deathblow to A. When the earth itself was found to be only one of the planets, it seemed absurd that all the others should be occupied in influencing it. The argument has really little force, but it produced the effect. Belief in A. is not now ostensibly professed in any Christian country, though a few solitary advocates have from time to time appeared, as J. M. Pfaff in Germany, *Astrologie* (Bamb. 1816). But it still holds sway in the East, and among Mohammedans wherever situated. Even in Europe the craving of the ignorant of all countries for divination is still gratified by the publication of multitudes of almanacs containing astrological predictions, though the writers no longer believe in them.

Many passages of our old writers are unintelligible without some knowledge of astrological terms, numbers of which have taken root in the language. In the technical rules by which human destiny was foreseen, the heavenly *houses* played an important part. Astrologers were by no means at one as to the way of laying out those houses. A very general way was to draw great circles through the north and south points of the horizon, as meridians pass through the poles, dividing the heavens, visible and invisible, into twelve equal parts—six above the horizon, and six below. These were the twelve houses, and were numbered onward, beginning with that which lay in the east immediately below the horizon. The first was called the house of life; the second, of fortune, or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death, or the upper portal; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies, or of captivity. The position of the twelve houses for a given time and place—the instant of an individual's birth, for instance—was a *theme*. To construct such a plan was to *cast* the person's nativity. The houses had different powers, the strongest being the first; as it contained the part of the heavens about to rise, it was called the *ascendant*, and the point of the ecliptic cut by its upper boundary was the *scope*. Each house had one of the he as its *lord*, who was strongest in his

ASTRO'NOMY (Gr. *astron*, a

teaches whatever is known of the heavenly bodies. A. may be properly divided under three heads. 1. *Geometrical or Mathematical A.*, including the exact determination of the numerical and geometrical elements of the heavenly bodies—that is, their distances, shapes, magnitudes, the figures they describe in their motions, &c. 2. *Physical A.*, or the nature of the powers or forces that carry on the heavenly motions, the laws that they observe, and the calculation of the motions from a knowledge of these laws. 3. *Sidereal A.*, or whatever is ascertained regarding the universe of the fixed stars. *Practical A.* might form another division, which would include a knowledge of the various astronomical instruments; and a familiarity generally with the rules and calculations by which the requisite results are deduced from observations.

Such parts of this extensive subject as are deemed suited to the present work, will be found under their appropriate heads, such as CIRCLE, TRANSIT INSTRUMENT, ABERRATION OF LIGHT, REFRACTION, PARALLAX, EQUATOR, PRECESSION, TIME, SOLAR SYSTEM, SUN, LIBRATION, PLANETS, FIXED STARS, COMET, &c. A brief sketch of the history of astronomical discovery is all that can be attempted in the present article.

The history of A. dates from a very early period. It is the most ancient of all the sciences. The Chinese, Hindus, Chaldæans, Egyptians, and even the Greeks, are known to have investigated the heavens very long before the Christian era. But with the first four nations, A. may be said to have been a sentiment rather than a science—a vague notion built up out of crude speculations, rather than a correct theory founded on systematic observation. In China, A. was intimately associated with state politics; the Indians, Chaldæans, and Egyptians made it a matter of religion; and each of these nations applied it to astrological purposes. In Greece alone was it prosecuted for its own sake.

The Chinese, Chaldæans, Hindus, and Egyptians each claim the honour of having been the first students of A., and each has had advocates to support its claim. The Tirvalore tables (asserted by the Hindus to belong to an epoch of 3102 years B.C.—the commencement of the Cali-yug, or iron age, of their mythology—at which period a conjunction of the sun, moon, and planets is said to have occurred) are, so far as their date is concerned, altogether unreliable. Modern calculations have conclusively proved that no such conjunction could possibly have taken place at the time specified; and the elements of the tables are, in the general opinion of scientific men, of a character far in advance of the actual observations of that period. There is no doubt that the epoch is fictitious—that the date of these tables is fixed much earlier than their internal evidence justifies; but it is matter of dispute whether they were the result of the observations of Hindus themselves at some later period before the Christian era, or whether they were constructed after that era from data furnished to them by the Arabs or Greeks. Those who hold the former view, quote the well-known mathematical attainments of the Indians, and their aversion to intercourse with foreigners, as arguments in its favour; those who support the latter, point out that the tables are a mean between those of Ptolemy and Albategnius, or Al Batani, a distinguished Arabian astronomer, and therefore likely to have been derived from these two sources. Those who are interested in the question of the originality of these tables, may refer to Delambre, and to Bailly's *Hist. de l'Astronomie Indienne*.

The Chinese have astronomical annals claiming to go back 2857 years B.C. In these there is little record of anything but of the appearance of comets and solar eclipses; and regarding the latter phenomena, they tell nothing, save the fact and date of their occurrence. Professional astronomers were compelled to predict every eclipse under pain of death. The popular idea was, that an eclipse was a monster having evil designs on the sun, and it was customary to make a great noise, by shouting, beating of gongs, &c., in order to frighten it away from its solar prey. The many eclipses which the Chinese report have been recalculated, but not more than one anterior to the time of Ptolemy could be verified. At an early period, however, the Chinese appear to have been acquainted with the luni-solar cycle of nineteen years (introduced into Greece by Meton, and since known as the Metonic Cycle), and they had also divided the year into 365¼ days. Solstitial observances are said to have been [illegible] by a gnomon in the 11th c. B.C. The Egyptians, it is supposed, were the first instructors of the Greeks in A. They do not, however, appear to have observed much for themselves. The meaning of what data they have left behind them can be guessed at only in a few instances. No mention is made by Ptolemy of the idea entitled to them, that the planets Mercury and Venus move round the sun; the probability therefore is, Ptolemy not being likely to overlook such a novel thing, that they entertained no such notion at the time of his visit, but that it is an after-thought of more recent ages. From the accuracy with which some of the pyramids face the cardinal points, there is a supposition that they must have been erected for astronomical purposes; but if it be true, as is stated, that Thales taught the Egyptians how to find the height of the pyramids by the shadow, and that the latter informed Herodotus

we know to be false, and inferior to the Pythagorean notions; but it had the merit of being founded upon a long and patient observation of phenomena, a principle which finally brought about its own destruction, while the previous theories were the results of pure hypothesis.

The most interesting circumstances connected with the early history of the Alexandrian school are the attempts made to determine the distance of the earth from the sun, and the magnitude of the terrestrial globe. Aristarchus of Samos—the pioneer of the Copernican system, as Humboldt calls him—is the author of an ingenious plan to ascertain the former. See ARISTARCHUS OF SAMOS.

Among other eminent members of this school were Timocharis and Aristyllus, who made the observations, which, together with observations of his own, enabled Hipparchus (q.v.) to discover the precession of the equinoxes; Eratosthenes (q.v.), who was the first who attempted to determine on true principles the magnitude of the earth, and to clear, as Humboldt expresses it, 'the description of the earth from its fabulous traditions;' and Autolycus, whose books on A. are the earliest extant in the Greek language.

We have now arrived at by far the greatest name we have yet met in astronomical science—that of Hipparchus of Bithynia (160—125 B.C.), and here may be said to begin the real written history of scientific A.; for not until his era were there facts correct enough and sufficient in number upon which to build a system. Hipparchus was at once a theorist, a mathematician, and an observer. He catalogued no less than 1081 stars. This is the first reliable catalogue we have. He discovered, as we have already mentioned, the precession of the equinoxes; he determined with greater exactitude than his predecessors had done, the mean motion, as well as the inequality of the motion of the sun; and also the length of the year. He also determined the mean motion of the moon, her eccentricity, the equation of her centre, and the inclination of her orbit; and he suspected the inequality afterwards discovered by Ptolemy (the evection). He invented processes analogous to plane and spherical trigonometry, and was the first to use right ascensions and declinations, which he afterwards abandoned in favour of latitudes and longitudes.

For more than two centuries and a half after the demise of this indefatigable astronomer, we meet with no name of note. Ptolemy (130—150 A.D.) is the next who rises above the mass of mediocrities. Besides being a practical astronomer, he was accomplished as a musician, a geographer, and mathematician. His most important discovery in A. was the libration or evection of the moon. He also was the first to point out the effect of refraction. He extended and improved many of the theories of Hipparchus, and was the founder of the false system known by his name, and which was universally accepted as the true theory of the universe, until the researches of Copernicus exploded it. The Ptolemaic system, expounded in the *Great Collection*, or, as it was called by the Arabs, the *Almagest*—from which source most of our knowledge of Greek A. is derived—placed the earth immovable in the centre of the universe, making the entire heavens revolve round it in the course of twenty-four hours.

With Ptolemy closes the originality of the Greek school. His successors were men of no mark, confining themselves for the most part to astrology, or to comments on earlier writers. It is to the Arabs that we owe the next advances in A. They commenced making observations 762 A.D., in the reign of the Caliph Al Mansur, who gave great encouragement to science, as did also his succ
ssd Haroun Alraschid' and Al Mamo

whom were themselves diligent students of A. For four centuries, the Arabs prosecuted the study of the science with assiduity, but they are chiefly meritorious as observers. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. They, however, determined with much more accuracy than the Greeks had done the precession of the equinoxes, the obliquity of the ecliptic, and the solar eccentricity; and the length of the tropical year was ascertained within a few seconds of the truth. The most illustrious of the Arabian school were Albategnius or Al Batani (880 A.D.), who discovered the motion of the solar apogee (see ANOMALISTIC YEAR), and who was also the first to make use of sines and versed sines instead of chords; he corrected the Greek observations, and was altogether the most distinguished observer between Hipparchus and the Copernican era; and Ibn-Yunis (1000 A.D.), an excellent mathematician, who made observations of great importance in determining the disturbances and eccentricities of Jupiter and Saturn, and who was the first to use cotangents and secants.

In the northern part of Persia, an observatory was erected by a descendant of the renowned warrior Genghis Khan, where some tables were constructed by Nasir-Eddin; and at Samarcand, Ulugh Beg, a grandson of Timur, made, in 1433 A.D., many observations, and the most correct catalogue of stars which, up to his time, had been published.

In the 13th c., A. was again introduced into Western Europe, the first translation from the *Almagest* being made under the Emperor Frederick II. of Germany, about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alfonso X. of Castile. An Englishman, named Holywood (Sacrobosco), in 1220 wrote a book of great repute in its day on the spheres, chiefly abridged from Ptolemy; and among others who did much to promote a taste for A. were Purbach (1460), Regiomontanus (John Muller), who died in 1476, and Waltherus, a pupil of the latter, who made numerous observations of merit.

We now come to the illustrious name of Copernicus (b. 1473, d. 1543), to whom was reserved the grand honour and the danger—for there is ever danger in bringing old notions into disrepute by introducing new systems of truth—of exploding the Ptolemaic idea, and of promulgating a correct though imperfect theory of the universe. His system is in some part a revival and systematic application of the opinions said to have been held by Pythagoras. It makes the sun the immovable centre of the universe, around which all the planets revolve in concentric orbits, Mercury and Venus within the earth's orbit, and all the other planets without it. In the Copernican theory, there were many of the old notions which have since been exploded. It is a current belief that Copernicus, afraid to state boldly such heterodox views of the universe as those he entertained, gave them forth in the form of an hypothesis. Humboldt, in his second volume of *Cosmos* (p. 345), denies that he did so. This distinguished authority says: 'The language of Copernicus is powerful and free, and bursts forth from his inmost convictions, and thus sufficiently refutes the ancient opinion, that he has brought forward the system which is immortalised by his name, as an hypothesis made for the convenience of calculating astronomers, or for one which has but a probable foundation.' The same author also refutes the popular notion that Copernicus died a few hours after receiving a printed copy of his book. He was broken down in body and mind when his work *On the Revolutions of the Heavenly Bodies* was brought to him, but he did not die until 'many days afterwards, on the 24th May 1543.'

Among the contemporaries of Copernicus were Rheinhold, who constructed the Prutenic tables; Recorde, who was the first to write on A. in English; and Nonius, a Portuguese, who invented a method for dividing the circle. The study of A. was also much aided about this time by the liberality of the Landgrave of Hesse-Cassel, William IV.

Decidedly the most industrious observer and eminent practical astronomer from the time of the Arabs to the latter half of the 16th c. was Tycho Brahé (b. 1546, d. 1601). Considerable odium attaches to him on account of his repudiation of the Copernican system, but it should not be forgotten that in the time of Tycho that system was not supported by the conclusive evidence we are now in possession of. Tycho's system, which made the sun move round the earth, and all the other planets round the sun, they moving with it round the earth, explained all natural phenomena then observed equally well, while it must have appeared more probable than the crude and, at that era, undemonstrable theories of Copernicus. Tycho Brahé compiled a catalogue of 777 fixed stars, more perfect than any that had previously appeared. He made the first table of refractions, and discovered the variation and annual equation of the moon, the inequalities of the motion of the nodes, and the inclination of the lunar orbit, and rejected the trepidation of the precession, which had hitherto injuriously affected all tables. He also made some interesting cometary investigations.

To his researches are mainly due the discovery by Kepler (b. 1571, d. 1630) of those famous laws which have rendered his name immortal. See KEPLER. To Kepler is due the credit of divesting the Copernican system of its absurdities. Kepler is also said to have had some notion of the law of gravitation.

Galileo Galilei (b. 1564, d. 1642) first applied the telescope (which he made from a general description of the instrument of Hans Lipperhey of Holland, who was the first inventor of the telescope) to the investigation of the heavens. He was rewarded by the discovery of the inequalities on the moon's surface. The important discoveries of the four satellites of Jupiter, the ring of Saturn—not then distinctly recognised as a circle—the spots on the sun, and the crescent form of Venus, followed in quick succession. For propagating the Copernican doctrine of the world, Galileo incurred the displeasure of the priests, and was compelled by the Inquisition to retract his opinions.

But the eternal laws of nature are not to be suspended by the recantation of a philosopher forced by the tyranny of priestcraft. The earth moved gaily on round the sun in spite of both; and scientific truth was now too old to remain in the restrictive leading-strings of any ecclesiasticism.

The next great epoch in the history of A. brings us to England and Newton (b. 1642, d. 1727). In the interval, practical A. had profited largely by the logarithms of Napier; the mathematical researches of Descartes; the application of the telescope to the quadrant by Gascoigne, an Englishman, and afterwards by Auzout and Picard; by Römer's discovery of the progressive motion, and measurement of the velocity, of light; by the invention of Vernier; and the application of the pendulum to clocks by Huygens, who also brought into use the spiral spring, and made some valuable observations on the ring and satellites of Saturn; as well as by the investigations of Norwood, Horrocks, Hooke, Hevelius, Gilbert, Leibnitz, and Dominicus Cassini, to the last of whom especially the scientific world owes much. Among

Dr Halley, who suc- lamsteed as astronomer royal, discovered ated mean motion of the moon, and certain es in Jupiter and Saturn, but he is most r his successful investigations into the nd nature of comets. His successor was ey, who, in the year of Newton's death, important discovery of the aberration of ich furnishes the only direct and conclusive have of the earth's annual motion. To we are indebted for our knowledge of the of the earth's axis. He was, besides, an l observer, and left behind him at his ards of 60,000 observations. Altogether, is deservedly one of the most honoured modern A. Dr Maskelyne, who was l to the observatory after Bradley, origi- *Nautical Almanac*.

to mention the names of men who from of Bradley to the present time have added, y and practice, to our knowledge of A., tend this synopsis much beyond the limit assigned to it. If the 18th c. opened with ved from the physical demonstrations of it closed magnificently with the telescopic s of Sir William Herschel, who added to ...se a primary planet (Uranus) with its gave two more satellites to Saturn, resolved ...-way into countless myriads of stars, and d the mystery of nebulæ and of double e stars. Laland, Lagrange, Lacaille, and , in the latter half of the 18th c., did their researches and analyses to systematise ove the science of A. The instrumental observation were also, during that time, to high perfection. Laplace, in his great e *Mécanique Celeste* (1799–1808), gave ther proof was needed of the truth and ... of the Newtonian theory.

...e. opened with the discovery of the four ...ets—Ceres, in 1801, by Piazza; Pallas and Olbers—the former in 1802, and the latter in 1807; and Juno, by Harding, in 1804. In 1845, Hencke discovered the fifth of this group revolving between Mars and Jupiter, to which the name of Astræa was given; and, by the beginning of 1875 140 Planetoids (q. v.) had been discovered. The greatest event of the century has been the discovery of the planet Neptune in 1846.

Observations upon Uranus had shewn the motions of that planet to present great irregularities, which could not be explained by the action of Jupiter and Saturn; and after carefully examining the analytical theory of Uranus, Leverrier, a young academician of France, in the summer of 1846, published the elements of an undiscovered planet, the cause of the perturbations. He boldly predicted its existence, calculated its mass, and referred to its place in the heavens; and scarcely a month afterwards, on the 23d of September, the hitherto concealed object (Neptune) was found by M. Galle of Berlin. But it has only been by accidental circumstances that France has the honour of this remarkable achievement. Mr Adams of Cambridge had arrived at results more perfect than those of Leverrier, and had communicated them to Mr Challis, professor of A. at Cambridge in September 1845, a year before the discovery of the planet, and nearly a year before the publication of Leverrier's final calculations. Mr Challis, it appears, commenced a search for the planet on July 29th, and on August 4th and 12th, he actually seized the planet, and recorded two positions of it, but did not recognise it, through not comparing his observations, which a pressure of occupation, and an impression that the discovery required a much more extensive search, prevented. But for this, and the non-publication of the Cambridge mathematician's results at the time they were forwarded to Sir George Airy in October 1845, the honourable position of M. Leverrier would have been occupied by Mr Adams, and that of M. Galle by Mr Challis.

The century, however, has been chiefly remarkable for its laborious efforts to correct, systematise, and extend the results of former discoveries. Admirable and extensive catalogues of stars and double stars, and of nebulæ, have been made; and optical and other instruments have been brought to what appears almost a state of perfection. Lord Rosse's reflecting telescope, with a speculum six feet in diameter, being the triumph of modern mechanical and mathematical skill. In more recent years, research has been directed chiefly towards the physical nature of the sun and other heavenly bodies by means of spectrum-analysis. See SPECTRUM; SUN.

ASTUR. See FALCONIDÆ and GOSHAWK.

ASTURIAS, a northern province of Spain, bounded on the E. by Santander, on the S. by Leon, on the W. by Galicia, and on the N. by the Bay of Biscay. The low hills of Leon and Old Castile rise gradually to the mountain-chain which forms the south boundary, and towers to a height of about 11,000 feet in the summit *Peña-de-Peñaranda*. The main road from Leon to Oviedo passes over the mountain-chain at Pajares. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The summits of the mountains are covered with snow even as late in the year as August. The climate is damp; clouds hang almost continually about the peaks, gathering to them the fogs of the Atlantic. From the mass of calcareous rock, marble crags rise from 200 to more than 400 feet. The principal kinds of wood are oak, chestnut, silver and Scotch firs. Some of the forests in the remoter districts are very superb. Alpine pasturage decks the slopes, and a richer covering of green

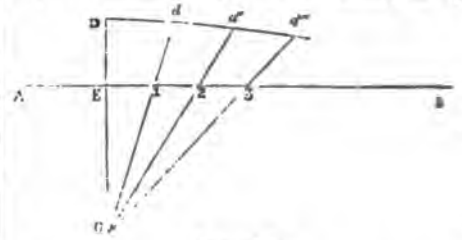
is found in the narrow valleys. In the wider valleys, the soil yields barley, wheat, maize, figs, olives, grapes, oranges. The coasts have good fisheries. The chief minerals of the province are copper, iron, lead, cobalt, arsenic, antimony, and coal. The pasturage of the higher valleys supports an excellent breed of horses, with numerous horned cattle.

A. was never firmly occupied by the Arabs, but afforded a place of refuge to the Goths in the 8th c. Here the famous Pelayo was made king in 718 A.D.; and his successors, after contending successfully against the Arabs, were made kings of Leon in the 10th c. The Asturian still boasts of his independence as a free hidalgo, and is simple in manners and brave, but less industrious and sociable than his neighbours in Biscay and Galicia. Many Asturians leave their province to seek a livelihood in other parts of Spain, and after saving money, return to dwell among their native hills and valleys. They have been termed the Swiss of Spain; and they are equally faithful and fond of money. Among them, the *Vaqueros* form a distinct caste, intermarrying among themselves, and leading a nomadic course of life, spending the winter on the sea-coast, and the summer on the hills of Leytariegos. OVIEDO, the capital of A., has, since 1833, given its name to the whole province. The other considerable towns are the ports Gijon and Aviles. The whole area of A. includes 3686 square miles, with a population of (1870) 610,883.

The eldest son of the Spanish king has the title of Prince of A., professedly an imitation of the English Prince of Wales, having been taken at the solicitation of the Duke of Lancaster in 1388, when his daughter married the eldest son of Juan I.

ASY'LUM, a place of refuge. In ancient times, sacred places, especially the temples and altars of the gods, were appointed as asylums to which criminals, as well as persecuted individuals, might flee for refuge; and to molest them in such places was regarded as an impiety. An analogous institution is found in the laws of the Jews as described in the 35th chapter of Numbers, where six 'cities of refuge' are appointed for persons guilty of manslaughter. Among the Greeks in early times, these asylums might be sometimes useful in preventing hasty retribution; but in the course of time they were so much abused that their sanctity was in a great measure disregarded. Thus Pausanias, who fled to the altar of Minerva, was taken and slain there by the Lacedæmonians, and in other cases the refugee was compelled to leave the A. by fire or starvation. In Rome, the Emperor Tiberius abolished all such places of refuge from law, excepting those in the temples of Juno and Æsculapius. The custom of allowing to real or supposed criminals a place of safety in temples, was also adopted by the Christian Church. In the time of Constantine the Great, the churches were made asylums; and Theodosius II. extended the privilege to all courts, alleys, gardens, and houses belonging to the church. In 681 A.D., the synod of Toledo extended the privilege of A. to a space of 30 paces around every church. In the lawless periods of the middle ages, the influence of the church often prevented deeds of gross injustice and violence; but the sanctity of churches was abused by criminals; and this led to several modifications which gradually destroyed the privilege of Sanctuary (q. v.). In England, it was abolished by acts passed in 1534 and 1697. The word A. is now applied to places of shelter for unfortunate or destitute persons, and especially to hospitals for the insane. See LUNACY.

ASYMPTOTE (Gr. not coinciding), a line that approaches nearer and nearer to some curve without ever meeting it. An example of an A. will be seen under HYPERBOLA. As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line, and draw a perpendicular reaching to any



Asymptote.

distance, D, beyond the line; set off any equal distances, E—1, 1—2, 2—3, &c., along AB; and draw C1*d*, C2*d'*, C3*d''*, &c., making 1*d*, 2*d'*, 3*d''*, &c., equal to ED. Now, it is evident that each of the points *d*, *d'*, &c., is nearer to the line AB than the one to the left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoid*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB; for a line drawn from C to any point in AB, however distant that point, must, when produced, cross AB. AB is thus an *A.* to the curve. To the senses, indeed, the curve and line seem become one, because all physical or sensible lines have breadth. It is only with regard to mathematical lines (see LINE) that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented.

ATA'CAMITE, an ore of copper, found as a crust on the lavas of Vesuvius and Etna, especially on those of Vesuvius erupted in the years 97, 1794, 1820, and 1822. It occurs abundantly in some parts of South America, as at Atacama in Peru, from which it derives its name; at Remolinos, Santa Rosa, and other districts in Chili; and at Sarapca in Bolivia, where it is associated in veins with ores of silver. The natural varieties of A. are crystallised, massive, and pulverulent or granular. The massive or compact variety is usually reniform, with a fibrous structure. The crystals are short and needle-shaped; the primary form is a rhombic prism. It has been sometimes described as a chloride of copper, but incorrectly; and sometimes as a hydrochlorate (muriate) of copper; it is rather to be regarded as a combination of protoxide of copper with chloride of copper. It is a rich and productive ore, containing about 55 to 60 per cent. of copper. The percentage composition of various specimens of A. is as follows:

	Copper Protoxide.	Muriatic Acid.	Water.	Total
Compact atacamite,	72·0	16·3	11·7	100
" "	76·5	11·0	12·5	100
Sandy atacamite, . .	70·5	11·5	18·0	100
Crystallised atacamite,	73·0	16·2	10·8	100

A. often forms on the surface of copper exposed to the air or sea-water; and the greenish incrustation observed on antique bronze utensils, weapons, and other articles, and commonly known as the *æruginis nobilis*, is composed of this salt. On some antique bronzes from Egypt the A. is crystalline. Atacamite is worked in South America as an ore of copper; and considerable quantities are sent to England to have the metal extracted therefrom. See COPPER.

ALPA, the favourite son of Huayna of Peru, who died in 1525, about seven Pizarro's arrival in Peru. The mother ing of the pure Inca blood, her son was luded from inheriting the throne; but figure, bold spirit, and quick intelli- upon the affections of his father, that bed he declared it to be his will that ceive as his portion the ancient kingdom cently conquered), while Huascar, his hould possess Peru. For five years the ed on terms of real or apparent friend- length the restless ambition of A., who tly aspiring to new conquests, excited ess of Huascar, who, in an evil hour, l to send an envoy to his brother, with to require him to render homage for a of Quito. A. fired at the proposal, instantly declared. Placing himself at army of veterans which his father invaded Peru, and in the spring of defeated Huascar on the plains of neighbourhood of Cuzco, the tropolis, only a few months al the Spaniards. Huascar was , and confined in the strong fortress of an followed, according to Garcilasso de series of atrocious massacres of all in ran the blood of the Incas; but his are so monstrous, and possess so little they are rejected by Prescott as redible. In the meantime, the embarked at Tumbez; and after and perilous march through the Pizarro, at the head of his two approached the victorious camp found some fifty thousand men By a daring but diabolical stratagem, ained possession of the person of the d come to visit him in a friendly spirit. st was explaining the Christian religion, er of the pope over all the kingdoms of nd how the pope had presented Peru narch, in whose name they had tly interrupting him, told him pe whoever he was) must be a crazy of giving away countries which were When he inquired on what authority were made, the priest pointed to the ch A. dashed the book on the ground, and gan to fill with Indians. The moment The crime which Pizarro had resolved ight before must be executed then or waved a white scarf, which was the l upon. The mysterious artillery poured into the terrified masses of Peruvians, h cavalry rode them down with y. Confusion seized the natives; ted—being unarmed—to this horrible ly anxious to save their sacred Inca; efforts to accomplish this proved un- l after exhausting hours in the miserable rder, the inhuman Spaniards succeeded him. A. was treated with a great show at first, and more especially when he ransom, 'not merely to cover the floor, the room in which he stood with gold he could reach.' When A.'s brother, was still a prisoner, heard of this, he more advantageous terms for himself. this, A. had him secretly assassinated. treasure which was to constitute the A. now began to pour in, and at length d his freedom. Thus Pizarro refused to cused A. of plotting against him. The much base treachery on the part of the Spaniard, was a mock-trial, in which A. was condemned to be burned. On the 29th of August 1533, he was led to the stake, but on agreeing to be 'baptised,' his sentence was commuted to death by strangulation.

ATALA'NTA, a mythical personage, the daughter of Jasus and Clymene, was born in Arcadia, and celebrated as a huntress, well skilled in the use of the bow and arrow. Her father, who had wished a son, exposed her, while an infant, on Mount Parthenios, where she was found near the entrance of a cave by hunters, who are said to have brought her up, and afterwards restored her to her parents. While living as a wild mountain-maiden, she slew the centaurs Rhœcus and Hylæus. Afterwards, she sailed with the Argonauts (q. v.) to Colchis, and took a prominent part in the chase of the Calydonian boar (q. v.). She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length she was conquered by a trick of one Meilanion, whom she was compelled to marry. He obtained from Venus a gift of three golden apples, which he successively dropped in the race; and A. was so charmed by their beauty, that she could not refrain from stooping to gather them, and so lost.—Mention is made of another A. in Greek antiquity, to whom a different parentage is assigned, but regarding whom the myth is essentially the same.

ATARAIPU', a term signifying *Devil's Rock*. It is applied to one of the most singular eminences in the world, a granite pyramid in British Guiana, which rises abruptly from the plain about 900 feet, wooded for rather more than one-third of the height, but bare thence to the peaked summit.

ATCHAFALAY'A, a branch of the Mississippi at its delta. It forms so large an angle with the main river, that, after a course of only 130 miles, it enters the Gulf of Mexico, 120 miles to the west of New Orleans. From the Red River, which enters the Mississippi just above its own point of departure, the A. had received so much drift-wood, as formed at last a stationary raft 10 miles long, 220 yards broad, and 18 feet deep—an obstacle to navigation which the state of Louisiana required four years to remove.

ATCHEE'N, a kingdom forming the north-west part of Sumatra; area, 2260 sq. m.; pop. 500,000; in 95° 20'—97° 40' E. long., and 2° 50'—5° 40' N. lat. The interior is mountainous—Abong Abong, 11,000 feet; Loose, 11,000; the Golden Mountain, 6460; Batu Gapit, 6155; Tampat Tuan, 4020. The natives well made, industrious, intelligent, treacherous. In March 1873, the Dutch declared war, and though at first repulsed, may now be said to have conquered the country. A., the capital, lies on both sides of the river in 5° 35' N. lat., and 95° 25' E. long., in a large valley formed by ranges of hills, of which the Golden Mountain is the highest. Pop. 36,000. They barter for opium with Penang and Singapore, pepper, edible nests, gold-dust, camphor, benzoin, sulphur, satin-wood, betel-nuts, &c.

ATCHEVEMENT is a term nearly equivalent to armorial bearings, and is often used when speaking of the arms of a deceased person as displayed at his funeral or elsewhere. In this sense it is more commonly used in its abbreviated form of Hatchment (q. v.).

A'TÉ, according to Homer, the daughter of Jupiter—or of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Jove, whom she

had incited to take an oath of which he subsequently repented. She then travelled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence upon mankind. But her steps were followed by the goddesses *Litai* (prayers), benevolent daughters of Jove, who healed those who had been afflicted by A. The tragic writers describe A. as the goddess of retribution. Their representations almost identify her with NEMESIS and ERINNYS.

A'TELES (Gr. incomplete), a genus of American monkeys, of the division with long prehensile tails, to which the name SAPAJOUS (q. v.) is sometimes collectively applied. In the genus A., the head is round, and the facial angle about 60°; the limbs are remarkably long and slender, upon which account the English name SPIDER MONKEY (q. v.) is sometimes used as a generic designation; and the forelimbs are either entirely destitute of a thumb, or have a mere rudimentary one, a peculiarity in allusion to which the name *A.* was given. The name Coaita or Quata is frequently given to some of the species of A., but is sometimes limited to *A. Paniscus*, as Spider Monkey sometimes is to *A. arachnoides*. One of the best known species is the Marimonda (*A. Belzebub*), a common monkey of Guiana, and which occurs in immense numbers on the banks of the Orinoco.

ATELIERS NATIONAUX, or NATIONAL WORKSHOPS, a term under which such institutions became renowned in connection with the French revolution of 1848. In almost all countries and ages, there have been projects for organising labour under public authority, designed generally for the benevolent purpose of obviating the distress caused by casual depressions in trade. However distinctly the laws of political economy were laid down on the point, it could always be said that these were merely theoretic, and therefore this one instance of practical experiment, however calamitous in its day, left behind it a valuable lesson. The principles of political economy on this matter are—that competition only can fix the extent to which labour is required in any department, and the rate at which it must be remunerated; that it is this competition which gives the workman a stimulus to labour effectively and profitably; and that if this stimulus were withdrawn, and all were paid alike, whether they worked well or ill, all would work ill, the public would be losers, and the large fund out of which labourers are supported under the competitive system would cease to exist. Immediately on the formation of the Provisional Government in February 1848, a permanent department was established, called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine, that all workmen were entitled to have a living provided for them on a certain uniform scale. They did not forcibly abolish private employment, but they held out inducements which made workmen leave and employers break up the existing establishments. Consequently, nearly all the Parisian workmen threw themselves on the government, and others flocked in from other quarters in alarming numbers. It was found that these crowds of men, who claimed the privilege of employment by the state, had very little idea of the duty of working, even were there distinct employment for them. But when the body had increased to considerably above a hundred thousand, the government found that they had this ever-increasing mass to feed, and nothing to feed them with, since trade thus meddled with was in reality ruined. It was consequently found necessary to put an end to the system, and the result was the bloody battle of Paris, which brought about the restoration of despotism. One incidental experiment will perhaps best explain the ruinous tendency of the whole the Hôtel Clichy, 1500 tailors were assemb uniforms for the new *garde mobile*. Th to receive among them for the complet much as an army-contractor would have In the meantime, they were paid two fra subsistence money; the rest was to be div them at the end. The men were buoyed notion that they were to receive not onl proper wages, but the indefinite and e which they supposed to form the profi. tractor, forgetting that such profit about 3 per cent. Their disappoin when they found nothing to divide. fact, a loss. When paid their two fran more than half what they obtained when a contractor—they were paid more tha their labour and the profit of the transa The reason is pretty obvious. Each m for himself, and paid for his work on the system, exerted himself; but when one n tions went virtually for nothing, unless 1499 others to exert themselves to the sam all were alike lazy.

ATELLA'NÆ, *Fabulæ Atellanæ*, *Ludi Osci*), a kind of popular drama in introduced from Atella, a town in Campan Capua and Naples. After the Greek been brought to Rome by Livius Androni *Fabulæ Atellanæ* were still retained as and after-pieces. They are not to be with the Greek satiric drama, although th of both was to some extent the same. It satyrs figured; while the former pers Oscan characters. The *Macchus* and *B Fabulæ Atellanæ* may be considered the o modern Italian arlecchino (harlequin), characters of the same stamp. They favourite characters; spoke the Oscan excited laughter by its quaint old-fashi and phrases. The A. were neither so the *comœdia prætextata*, nor so low as t *tabernaria*, but indulged in a kind of decent drollery. The caricature was at pleasant, and though quizzical, it did no obscenity, like the *mimi*. Respectable R who could not appear as actors in the r drama without losing *caste*, were allo parts in the *A.* A few fragments of th farces have been collected by Bothe in hi *Latinorum Scenicorum Fragmenta* (Leip. also Munk, *De Fabulis Atellanis* (Leip. 1

, C, a king of the Western Goths,
ments lay on the north bank of the
ube, in the 4th c. Having taken advan-
weakness of the Roman empire when
armies were engaged in suppressing the
Procopius, war was declared against him
peror Valens. A. acted strictly on the
during two campaigns, in which the
gained no advantage over him; but in
year of the war (369 A.D.), he hazarded
battle, and was defeated, whereupon he
peace, and, with that object, had a confer-
h Valens in a boat on the Danube. Peace
luded, and A. had his attention occupied in
settling dissensions arising out of the Arian controversy which then agitated his people, when the first advance of the Huns on Europe alarmed the Gothic nation. A. attempted to secure the eastern borders of his kingdom; but the Huns forced the passages of the Dnieper, defeated the Goths, and advanced in great force into the plains of Dacia. When, in 374, the Western Goths were received by the Romans as allies, and had settlements granted them on the south of the Danube, A., with a part of his people, refused to accompany them, removing to the west, and fortifying himself against the new enemy. In 390, however, he was obliged to retire, when he accepted the hospitality of the Empire, and removed to Constantinople, where he met with a cordial and honourable reception by the Emperor Theodosius. At this time died Fritigern, the king of the Goths that had settled on the south of the Danube; and A. being made king of the whole Western Gothic nation, concluded a treaty of peace, in behalf of the whole, which had the effect of incorporating that people with the other subjects of the empire. He died at Constantinople in 381.

ATHANA'SIAN CREED, the third of the three œcumenical symbols, derived its name from its composition being attributed to Athanasius; it is also known, from its initial words in Latin, as the creed *Quicunque Vult*. The first part of this creed contains a detailed exposition of the Trinity; the second, the doctrine of the incarnation. Modern criticism has called in question the title of Athanasius to be considered the author of this creed. It was known as early as the beginning of the 6th c., but not under its present name. It is spoken of as 'Athanasius's Tract on the Trinity,' in some Articles of the middle of the 8th c., and is supposed to be alluded to, 'as the Faith of the holy prelate Athanasius,' in the Council of Autun, about 670. Athanasius himself makes no mention of this creed, although its doctrines are essentially his; nor do any of the church fathers. Other two circumstances speak against its authenticity: it is in Latin, and Athanasius wrote in Greek; the expressions, again, are different from those used by Athanasius in speaking of the same things. By Protestants, therefore, and even by most Catholics, its Athanasian origin has been given up, and its production has been assigned with most probability to the 5th c., and to Gaul; Hilary, Archbishop of Arles (about 430), being conjectured to be the author. The title of Athanasian probably became attached to it during the Arian controversy in Gaul, as being an exposition of the system of doctrine which was opposed to the Arian system, and which would naturally be called Athanasian from its chief propounder. It was received into the public offices of the Gallic Church in the 7th c., and by the middle of the 10th c. it was adopted at Rome and all over the West. In Britain, it was probably in use as early as 800. The Greek Church was late in receiving it, and even then not without altering the article concerning the 'Procession of the Holy Ghost.' The Reformers adhered to the A. C., and Luther called it 'a bulwark of the Apostles' Creed.' Even those churches that do not in any way acknowledge it as a symbol (as the Presbyterian Churches of Britain and America, as well as the Independents) generally accept its doctrines.

The A. C. is the most rigid and intolerant of the three Catholic symbols, and has given rise to much controversy; and though still generally received by Protestants as well as Catholics, the regard once had for it has declined. The points in this creed that give offence to some are defended by others, on the plea that it was not drawn up for the sake of gratuitously dogmatising on abstruse speculative

truths, but to counteract other dogmas which were held to be dangerously heretical. Waterland, in his *Critical History of the Athanasian Creed*, says: 'The use of it will hardly be thought superfluous so long as there are any Arians, Photinians, Sabellians, Macedonians, Apollinarians, Nestorians, or Eutychians, in these parts.' (See Articles under these heads.) With respect to what are called the 'damnatory clauses' (the clauses, namely: 'Which Faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly;' and: 'This is the Catholic faith, which except a man believe faithfully, he cannot be saved'), the churches which adopt the creed do not mean by them to imprecate curses, but to declare, as a logical sequence of a true faith being necessary to salvation, that those who do not hold the true faith are in danger of perishing; as it is said, Mark xvi. 16, 'He that believeth not shall be damned.' These clauses are also held to apply to those who deny the substance of the Christian religion, and not infallibly to every person who may be in error as to any one particular article. A rubric to this effect was drawn up by the commissioners appointed in 1689 for the review of the English Common Prayer Book, but none of their suggestions took effect. Compare also the 18th Article of the Church of England with these clauses.

ATHANA'SIUS, Primate of Egypt, was born in Alexandria about the year 296 A.D. There are no particulars on record of his lineage or his parents. Alexander, then officiating as primate or patriarch of Alexandria, brought him up in his own family, and superintended his education, with the view of his entering on the Christian ministry. In his youth, he often visited the celebrated hermit St Antony, and embraced for a time the ascetic life with the venerable recluse. He was but a youth and only a deacon when appointed a member of the first general council at Nice, in which he distinguished himself by his erudition and his eloquence.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. A., it is said, refused on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the Emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. His sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Treves. In 338, Constantius, now Emperor of the East, though unfriendly to the principles of the Trinitarians, recalled A. from his banishment, and restored him to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by a council of 90 Arian bishops assembled at Antioch. Against this decision a protest was made by 100 orthodox bishops at Alexandria; and in a council held at Sardis, 300 bishops, with Julius, bishop of Rome, at their head, confirmed the decision in favour of A., who was again replaced in his office (349 A.D.). The Arians once more acquired the ascendency after Constantius (in 353) had been made Emperor of both the East and the West; for in that year A. was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorets to a remote desert in Upper Egypt, where he was attended by one faithful follower. Here he wrote several works to confirm orthodox Christians in their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and A. returned to his former position as Patriarch of Alexandria (361 A.D.). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life, he was compelled again to flee from Alexandria, and remained concealed in the Theban desert until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the Emperor Valens. A. now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

A. was the leading ecclesiastic in the most trying period of the history of the early Christian Church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as an ornament of the age, as well as the most influential public character in matters of religion. Though twenty years of his life were spent either in exile, or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertions with complete success. He was a clear thinker, and as a speaker, was distinguished for extemporaneous precision, force, and persuasiveness.

His writings are polemical, historical, and moral; all marked by a style simple, cogent, and clear. The polemical works treat chiefly of the doctrine of the Trinity, the incarnation of our Saviour, and the divinity of the Holy Spirit.

The earliest edition of the collected works of A. in the original Greek appeared in two volumes, folio, at Heidelberg in 1600. It was accompanied with a Latin translation. The most complete edition is that published at Padua in 1777. A.'s Four Orations against the Arians, and his Oration against the Gentiles, were translated by S. Parker (Oxford, 1713); also, his Treatise on the Incarnation of the Word was translated by W. Whiston, forming part of that gentleman's *Collection of Ancient Monuments Relating to the Trinity and Incarnation*, London in 1713. The Epistles of A. in defence of the Nicene Creed, and on the Councils of Ariminum and Seleucia, together with his first Oration against the Arians, were translated, with notes, by the Rev. John Henry Newman, Oxford (1842).

A'THEISM, a word of modern formation, from Gr. *atheos*, 'without God,' signifies the doctrine of those who deny the existence of a God. The term atheist conveys such terrible associations to almost all minds, that there is perhaps no reproach from which men shrink more; and yet it has been freely applied by the zealous of all ages to those whose notions of the invisible powers differed from their own. The imputation is the most damaging that can be made, and it requires only a little ingenuity to make out a case of *constructive* A. from any set of opinions at all differing from the common. Thus, the ancient Greeks accused some of their philosophers

they did not deny the existence of a
nly rejected the common notions of a
gods. And in the Christian Church,
doctrine of the Trinity had been fixed and
those that denied the divinity of Christ
unusually branded as atheists.
error inspired by this name is strikingly
way it is repudiated by the adherents

ATHENÆUS, a Greek *rhetor* and *littérateur*, born at Naucratis in Egypt. He lived at the close of the second and beginning of the third century. His work, entitled *Deipnosophistæ* (Banquet of the Learned), in fifteen books, but of which we possess the first two, and parts of the third, eleventh, and fifteenth only in an abridged form, is very interesting, as it has preserved for us copious fragments of old writers, and treats, in the form of dialogue, of almost all the topics of ancient Greek manners, private and public life, arts, sciences, &c. It is not a work indicative of any high ability; the author, for the most part, appears in the character of an agreeable, well-read, epicurean gentleman, excessively fond of *tit-bits*, both of scandal and cookery. He tells many stories to the disadvantage of people whom history praises; but these we are by no means bound to believe, nor, indeed, is he a man whose opinions are worth much on any subject; but as a melange of literary, social, and domestic gossip, the value of the work is unrivalled. A. appears to have read enormously; he states that he had made extracts himself from 800 plays of the middle comedy alone. But his dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius, and has only achieved immortality through being a store-house of miscellaneous information, that otherwise would have been lost to the race. The best editions are by Schweighäuser (14 vols. Strasb. 1801—1807), and Dindorf (3 vols. Leip. 1827). There is an English translation of A. in Bohn's Classical Library (3 vols. Lond. 1854).

ATHENA'GORAS, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is one of the oldest of the apologetical writers, and is favourably known by his *Legatio pro Christianis*, which he addressed to the Emperor Marcus Aurelius in the year 177 A. D. He therein defended the Christians against the monstrous accusations of the heathen, viz., that they were guilty of atheism, incest, and cannibalism. His work is written in a philosophical spirit, and is marked by great clearness and cogency of style. We likewise possess a valuable treatise of his on the resurrection of the dead.

ATHENA'IS, an Athenian of distinguished beauty, the daughter of Leontinos the Sophist, was born about the close of the 4th c., A. D. She received from her father a superior education, being skilled in Greek and Latin literature, rhetoric, astronomy, geometry, and the science of arithmetic. After his death, she repaired to Constantinople, to obtain justice for the harsh treatment to which her brother subjected her. Here her beauty and intelligence made her the favourite of Augusta Pulcheria, sister of Theodosius II., who considered that she would make an excellent wife for the emperor. In 421, A. having been baptized and named Eudocia, was married to Theodosius, and in 438, made a splendid pilgrimage to Jerusalem, bringing with her, on her return, the supposed relics of the first martyr, Stephen. Afterwards, she lost the favour of Pulcheria the real manager of affairs—and was banished from the court. She then retired to Jerusalem, where she suffered many persecutions, and died, in the odour of sanctity, 460 A. D. A. wrote an epic poem on the war of Theodosius against the Persians, and several other metrical works which have not been preserved.

ATHENS, the capital of the ancient state of Attica, is said to have been founded by Cecrops, about 1550 B. C., and styled Cecropia; but even the ancients themselves doubted this tradition. Equally

uncertain is the story that it was first styled A., in honour of Athene, during the reign of Erichthonius. The ancient citadel was situated on the top of a square craggy rock, 150 feet high, with a flat summit, 1000 feet long, and 500 broad. Gradually, as population increased, A. extended itself over the wide and beautiful plain below. This increase is said to have been occasioned by the organisation of the twelve Attic tribes into a political confederacy or union by Theseus, the brightest figure that shines through the 'dark ages' of Attic history. The position of A. near the Gulf of Saronica, opposite the eastern coast of the Peloponnesus, was favourable to the acquirement of naval power. The city, which was distant four or five miles from the sea, possessed three harbours, all situated on the south-west, and connected with it by walls. The oldest of these harbours was Phalerum. It was also the nearest to the city, and accessible at all times by a dry road. The Peiræus was first used as a harbour by Themistocles. Munychia was the Acropolis of the whole rocky peninsula termed the Peiræus, and of immense importance strategetically. The two last harbours were connected with the city by the famous 'long walls,' of which we read so much in Athenian history. They were forty stadia, or nearly five miles in length. Two streams flowed in the vicinity of A.; on the east side, the Ilissus, which also washed the southern part of the city; and on the west, the Cephisus, about a mile and a half beyond the walls. To the west lay Salamis, with Eleusis on the north-west, Phylæ and Decelea on the north, Marathon on the north-east, and Hymettus on the south. All along the coast rose splendid buildings.

The whole of the magnificent prospect was crowned by the Acropolis, where all the most glorious monuments of A. were assembled. First rose the Parthenon (q.v.), or Temple of Minerva, a pile which even now, after the lapse of centuries, remains among the wonders of the world. The Propylæa, all built of white marble, formed the entrance to the Parthenon. Close to it, on the north side of the Acropolis, rose the Erechtheium, the most venerated of all Athenian sanctuaries, and connected with the oldest religious history of the city. The whole of it was destroyed by the Persians, but was restored during the Peloponnesian war. Its ruins still exist, and allow us to form a very correct idea of its external form and structure. In some points, it differed from all other examples of Greek temples. But it would be tedious and unprofitable to mention in detail all those magnificent buildings which were the glory of ancient Athens. It is sufficient to say, that gods were never more superbly honoured in any land. That enthusiastic love of the beautiful which animated the Athenians, turning their religion into an art, and making worship an education in æsthetics, is nowhere so clearly visible as in their religious architecture. Their mythological faith stood daily before their eyes in monumental splendour, for almost every deity had his temple or shrine in the city. Two of the finest buildings – the Temple of Theseus, and that of Jupiter Olympus – were on the outside of the city; the first to the north-west, the second to the south. The former was both a temple and a tomb, inasmuch as it held the remains of Theseus himself. It was built about 465 B.C., and was therefore older than the Parthenon. It had the privilege of an asylum for slaves, and the large space of ground which it enclosed was frequently used as a muster-ground for the Athenian soldiery. It was built of the favourite Pentelic marble, in the Doric style of architecture, and is the best preserved of all the monuments of ancient Athens. For centuries it was a Christian church, appropriately enough dedicated to St George, the chivalrous hero of the 'dark ages' of Christianity, as Theseus had been of the 'dark ages' of Attic history; but is now the national museum of the city. The Temple of Jupiter, of which sixteen grand Corinthian columns are still extant, to the south-east of the Acropolis, and near the right bank of the Ilissus, in size, splendour, and beauty, excelled all other Athenian structures. Immense sums of money were expended upon it from the time when it was commenced by Pisistratus, until it was completed by Hadrian, a period of 700 years. The building of it was frequently suspended, so that Philostratus calls it 'a struggle with time.' At the time the Persians sacked the city, it was fortunately only beginning to be built, and so escaped destruction. Aristotle speaks of it as a work of despotic grandeur, and equal to the pyramids of Egypt. The exterior was decorated by about 120 fluted columns, 61 feet in height, and more than 6 feet in diameter. It was 354 feet long, and 171 broad, and contained the celebrated statue of the Olympian Jupiter in ivory and gold, the work of Phidias.

Besides these wonders of art, the city contained places of interest of which the memory will perpetually remain—the Academy where Plato, whose estate lay near it, gave his lessons in a grove of plane-trees adorned with statues; tradition alleged it to have belonged originally to Academus. Hipparchus surrounded it with a wall, and Cimon adorned it with walks, fountains, and olive-grove. The Lyceum, the most important of the Athenian gymnasia, where Aristotle lectured; and, near to this, the Cynosarges, where Antisthenes the Cynic expounded his 'harsh and crabbed' doctrine; the hill of the Areiopagus, where the most venerable court of judicature was held; and the Prytaneum, or senate-house. About a quarter of a mile to the west of the Acropolis rises a low hill, which marks the locality of the Pnyx, a place of public assembly, forming a large semicircular area, bounded at the base by a limestone wall, from which projects a pedestal, carved out of the rock, and ascended by steps. This most interesting place has been preserved almost in its integrity, and, as we look around, we are carried back to the times when some six thousand Athenian citizens were here assembled, when the orator, standing upon the pedestal, could survey the Acropolis, with all its temples, the venerable Areopagus, and beyond the city, the extended plains and villages of Attica, with corn-fields, olive-grounds, and vineyards.

A., in its most flourishing period, numbered 21,000 free citizens; from which we may calculate that it contained about 200,000 inhabitants. More than two thousand years have passed over the beautiful city, and still its remains excite the admiration of the world. The Turks surrounded it with wide irregular walls, partly built out of the ruins of the old walls, and containing many fragments of noble columns. Of the Propylæa, the right wing, or Temple of Victory, was destroyed in 1656 by the explosion of a powder-magazine. Six columns, with lofty arches, remain to mark the site of the opposite wing. The interior of the Parthenon was used for some time as a Turkish mosque. Eight columns remain on the east of the front, several colonnades at the sides; and of the back pediment, where the combat of Minerva and Neptune was sculptured, nothing remains save the head of a noble horse, and two decapitated female figures. Of the pediment in front, several figures belonging to the group representing the birth of Minerva are preserved in the British Museum, and justly regarded as master-pieces of ancient sculpture. Of all the statues which the Parthenon contained, only one

Beyond the city, the attention of the spectator is arrested by the sublime ruins of the Temple of Jupiter Olympus. Pedestals and inscriptions have been found here and there, sometimes buried in the earth. The sculptures on the friezes of the interior of the Temple of Theseus, representing the exploits of Theseus, have been well preserved, while the external sculptures are almost utterly destroyed. The surviving industry of A. was inir-
of Sicily, who removed its silk ma

In 1456, A. fell into the hands of Omar, and, to consummate its degradation, under the low, sensual Turks, the city of Athens was regarded as an appanage of the harem, and governed by a black eunuch. The Venetians, having captured the city in 1687, intended to carry away as a trophy the quadriga of victory from the west front of the Parthenon, but shattered it in their attempt to remove it. In 1688, A. was again delivered into the hands of the Turks, and the work of demolition now proceeded rapidly. The grand remains of antiquity were used as quarries to supply materials for all ordinary buildings, and, in the course of another century, the city was reduced to its lowest point of degradation.

Modern A. (styled by the Turks Athina or Setines) is now the capital of the new kingdom of Greece. Previous to the Greek revolution (1821), it was a provincial city of inferior importance, the seat of a Greek metropolitan bishop, and under the jurisdiction of the Turkish governor in Eubœa. In 1821, the war of liberation commenced, and the Turks surrendered Athens in the following year; but again captured it in 1826, and took the Acropolis in 1827. After this it was left in ruins until 1830, when Attica was declared united with Greece by the protocol of the London Conference. In 1834, Otho, the son of the Bavarian monarch, who had been elected to the sovereignty of the new kingdom, removed his residence from Nauplia to A. Improvements now proceeded rapidly: Turkish manners and customs disappeared; the contemptible wooden houses and crooked streets were superseded by new ones - among which the Hermes, Æolus, Athene, and New Stadion streets are conspicuous; and, in 1836, the foundation of a new palace was laid, and it was completed in 1843. The municipal affairs of A. are now regulated by a mayor
chos) and council elected by the citizens.
A. has a gymnasium, a library enriched
donations from France and Germany
ity, where about 52 professors a

engaged. The number of students is between 500 and 600. Several interesting works have been printed in A. The French government has founded an Archæological Institute, and several missionary societies have appointed agents here. A. has almost no trade except in walking-sticks and smoking-tubes made of black-thorn. Pop. (1871) 44,510.

Political History of A.—It was the Ionic race that manifested most signally the distinguishing characters of Greek civilisation; and of this portion of Hellas, A., in the brilliant part of its history, stands out most prominently. According to tradition, its political power was first established by Theseus, king of Attica, who made A. the metropolis. Here he instituted the great popular festival of the Panathenæa, and, by encouraging settlements in the city, greatly increased its population. He divided the citizens into three classes: nobility, agriculturists, and mechanics. Until the death of Codrus in 1068 B.C., A. was governed by kings; afterwards, by archons elected from the nobility. The time of holding office was limited to ten years in 752 B.C., and to one year in 683 B.C., when nine archons were annually elected, one being called the *archon eponymus*, because the year was distinguished by his name. Here begins the authentic history of A. These archons, together with the council of nobles, afterwards called the Areiopagus, exercised the whole power of the state, and administered justice. The Athenian government was thus, like all other Hellenic governments, an oligarchy; but the changes introduced by the archon Solon, 594 B.C., though remarkably moderate, laid the foundation of that democratic constitution which was afterwards perfected by Cleisthenes. The condition of the population at the time of Solon was one of extreme suffering and discord, arising chiefly from the oppressive execution, by the aristocratic archons, of the law of debtor and creditor. This law was of old extremely harsh in Greece as well as in Rome; it assigned the debtor that could not fulfil his contract as the slave of his creditor. The great part of the soil of Attica was in the hands of the rich, and the mass of the population, who tilled the lands as tenants, were either in hopeless arrears, or already, with their families, actual slaves. Driven to desperation, the populace were ready to rise in mutiny; the oligarchy were afraid or unable to enforce the laws; and thus it was agreed to confer dictatorial power on Solon, well known for his wisdom, integrity, and sympathy with the people, and allow him to solve the problem. The disease being desperate, Solon applied the desperate remedy of abolishing existing contracts, liberating those that had been reduced to slavery, and forbidding for the future any one from pledging his own person or that of a member of his family. He next reformed the political constitution by dividing the freemen into four classes, according to the amount of their property. It was only the richer classes that paid taxes and were eligible to the offices of state; but all had votes in the assembly that elected the archons, and all sat in judgment on their past conduct, on the expiry of their year of office. The government, though still oligarchical, was thus modified by popular control. Its free operation was for some time (560—510 B.C.) interrupted by the usurpation of Peisistratus and his sons, whose *tyranny*, however, was mild and enlightened, the forms at least of the Solonian constitution being preserved.

On the banishment of the Peisistratidæ (510 B.C.), a further political reform was introduced by Cleisthenes, who extended the basis of the constitution, and rendered it essentially democratic. To Cleisthenes is ascribed the origin of the practice called *ostracism* (q. v.).

Then followed the brilliant period of the Persian war, when out of the circumstances which had seemed to threaten destruction, A. rose to the highest point of power and prosperity. Miltiades at Marathon, and Themistocles at Salamis, gained the victories which infused new courage and enthusiasm into the Greek nation. The period between the Persian war and the time of Alexander the Great, or from 500 to 336 B.C., was the most glorious in Athenian history; and in 444, Cimon and Pericles raised the city to its highest point of grandeur and beauty. But under Pericles, the beginning of a decline took place, through the decay of ancient morals and the Peloponnesian war, which ended in the capture of A. by the Lacedæmonians. After this, A. retained only the shadow of its former power and dignity. The thirty appointed ministers of government were, in fact, so many tyrants, supported by the Lacedæmonian army. After eight months of despotism had been endured, the tyrants were expelled by Thrasybulus, a free constitution was restored to A., and a new period of prosperity commenced. But it was not destined to endure long; a formidable foe, Philip of Macedon, now appeared in the north. The Athenians having opposed him in the Phocian war, Philip took from them several of their colonies. Then followed the defeat of the Athenians at Chæroneia (338 B.C.), a fatal blow to Greece. A. with other states became subject to Macedon. The free spirit of the citizens was broken, and in moral character they degenerated. After Alexander's death, a fruitless attempt was made to regain their liberty. Antipater instituted an oligarchy of wealth. Soon afterwards, A. was taken by Cassander, and placed under the rule of Demetrius Phalereus, who employed his power wisely and beneficently. Once more the old constitution of A. was restored by Demetrius Poliorcetes, and a short interval of independence was enjoyed, until the city was taken by Antigonus Gonatas. After liberating themselves from the dominion of Macedon, and joining the Achaian confederacy, the Athenians were so misguided as to support Mithridates against the Romans. This last error was fatal. Sulla conquered A., destroyed the port of the Peiræus, and left only the appearance of liberty and independence, which entirely vanished in the time of Vespasian. Still, after the spirit of liberty and progress had departed, A. long remained safe from spoliation. The Romans, in their respect for Grecian pre-eminence in art and philosophy, and moved also by religious reverence, long regarded Athens as a captive too noble and beautiful to suffer any indignity.

A'THENS, a name applied to twenty-three places in the United States. The most important of these is a thriving town in Georgia, 92 miles to the west-north-west of Augusta. It is the terminus of a branch-railway, which joins the Georgia Central. It contains a cotton manufactory, and is the market for an extensive cotton-growing region. It is the seat also of Franklin College, a flourishing seminary of education.

A'THERINE (*Atheri'na*), a genus of small fishes allied to the Mullet family (*Mugilidæ*), but latterly separated into a distinct family, *Atherinidæ*. The Atherines have more than twice as many vertebræ as the Mullets; they are of a rather slender form, but few of them exceed six inches in length. They have a protractile mouth, and very small teeth; some are quite toothless. Almost all the known species, which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each flank. Some of them are much esteemed for their delicacy. They all congregate in great shoals. They abound in the Mediterranean.

, a small town in the of
Ireland, on both sides of the Shannon, chiefly in the county of Westmeath, but partly in that of Roscommon. It is the largest town between Dublin and Galway, and lies on a commanding situation, 3 miles below Lough Ree, in a carboniferous limestone district. The chief manufactures are felt-hats, friezes, linens, and stays. A canal here, a mile long, enables large river-steamers to navigate the Shannon for 116 miles, from Killaloe to Carrick-on-Shannon, uninterrupted by the river-rapids. The Shannon is crossed by a fine bow-string and lattice iron bridge of two arches, 175 and 40 feet span. Pop. in 1871, 5748. A. sends one member to parliament. A. Castle, on the Roscommon bank of the Shannon, was founded in the reign of King John, and has now been rendered one of the chief military positions in Ireland. The fortifications cover 15 acres, and contain barracks for 1500 men.

ATHOLE (Pleasant Land), a district of 450 square miles, in the north of Perthshire. It occupies a great part of the southern slopes of the Grampian mountains, and is intersected by many narrow glens, down which flow the rapid tributaries of the Tay. It is chiefly composed of gneiss and quartz rock, with beds of primary limestone. Dr Hutton's explorations among the granite veins in Glen Tilt, were among the chief means of establishing the Plutonic theory of geology. A. was once one of the best hunting districts in Scotland. Athole deer-forest is said to contain 100,000 acres, and 15,000 head of deer, of which 100 are killed annually. In the picturesque Pass of Killiecrankie, in this district, 17 miles north-west of Dunkeld, Claverhouse fell in 1689, though victorious over the troops of King William III.

ATHOR, or ATHYR, but properly, *Het-her*, i.e., 'the habitation of God,' the name of an Egyptian goddess who, in the mythological system of that people, is ranked among the second class of deities. She was the daughter of Ra, the sun. By the Greeks, she was identified with Aphrodite (Venus). The cow was regarded as her symbol, and, in hieroglyphics, she generally appears with the head of that animal, bearing between her horns the figure of the sun's disk. A. is also represented as a cow itself, and as a bird with human face, horns, and the sun's disk. On the oldest monuments, she is frequently portrayed bearing a temple on her head, as in the Athor-capitals of the Ptolemaic buildings, falsely supposed to be heads of Isis. Originally, the goddess had a cosmogonic significance; later, she was called the 'mistress of dance and jest,' and held in her hands, as symbols of joy, the cord of love and the tambourine. Queens and princesses were often represented by the figure of A. Her worship was generally spread through Egypt. Her most sacred abode was at Denderah. After her the third month of the Egyptian year was named.

ATHOS, HAGION ORÓS, or MONTÉ SANTO, i.e., the Holy Hill, the principal mountain of a chain extending, in a peninsular form, from the coast of Macedonia into the Ægean Sea, between the Gulfs of Contessa and Monté Santo, and connected with the mainland by a narrow isthmus. The length of the peninsula is 40 miles; breadth, 4. According to tradition, it received its name from A., son of Neptune, or from A., a giant who battled against the gods. The highest summit in the chain, or Mount A. proper, a solitary peak at the southern extremity of the peninsula, rises 6350 feet above the sea-level. In ancient times, several towns were built on A. Herodotus mentions five. The most memorable thing in connection with A., is which Xerxes cut through the isthmus escape the stormy gales which rendered round the promontory very peril

had shattered the fleet of Mardonius some years before. Traces of this canal still exist. In the middle ages, A. was covered with monasteries, of which 20 still remain (besides several hermitages, chapels, &c.). The largest are the monasteries of Ivoron and St Laura; the richest, Vatopædi. The entire number of monks who inhabit the 'Holy Hill' is about 8000. They form a kind of monastic republic under the Turkish government, to which they pay an annual tribute of nearly £4000. The monks follow the rule of Basilius, and lead an ascetic life, engaged chiefly in agriculture, gardening, and the care of bees. In diet, they restrict themselves to herbs, fruits, and fish. They carry on a considerable trade in amulets, images, crucifixes, wooden articles of furniture—all of their own manufacture—and also reap profits from the numerous visits of pilgrims. Karyæs, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens, and has 1000 inhabitants. Here the market is held; but no female, even of the animal kind, is permitted to be present, or even to enter the peninsula. In the middle ages, A. was the centre of Greek learning and Christian-Byzantine art. Now, scarcely more than two or three monks, of tolerable education, can be found in a monastery. The libraries are neglected, though containing several beautiful old manuscripts, some specimens of which have been brought to Western Europe. They contain, however, little or nothing of value in classical literature.

ATHY', a small town in the south-west of Kildare county, Ireland, on the east side of the river Barrow, here navigable for barges. It lies in a carboniferous limestone district. It chiefly consists of two main streets. Pop. (1871) 4113. Its chief export is grain.

ATLA'NTA, a flourishing city of Georgia. It owes its prosperity chiefly to its situation, being the focus of four of the principal railways of the state—the Georgia, the Macon and Western, the Atlantic and Western, and lastly, the La Grange. Independently of these means of communication, the surrounding country, besides being rich in grain and cotton, contains gold, iron, and other valuable minerals. A. was destroyed by General Sherman, November 1864, but is rapidly recovering its former prosperity. Pop. (1870) 21,789.

ATLA'NTES, in Arch., so called, by the Greeks, in reference to the mythical Atlas (q.v.), are male

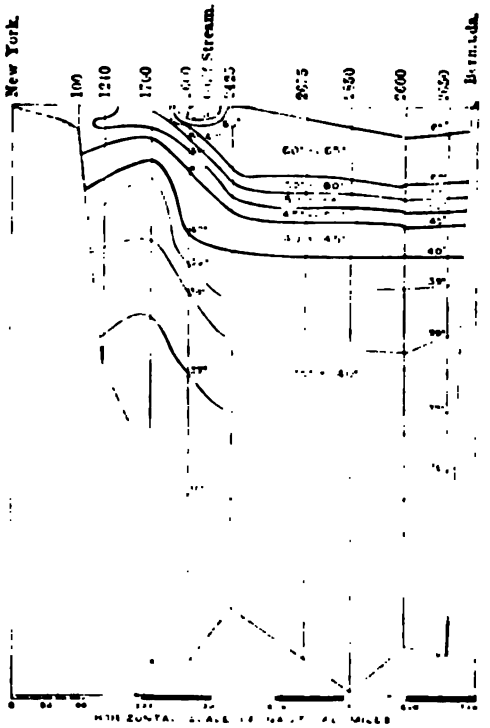
ding the depth of the A., it is only recently
able data have been obtained; along certain
tracts, especially those of the *Challenger*, the profile of the bottom can now be laid down with considerable certainty. The deepest soundings made by the *Challenger* with its improved method of sounding (see SOUNDINGS), is 3875 fathoms, or 23,250 feet, at a point about 90 miles off St Thomas, West Indies. A remarkable ridge, about 400 miles wide, and 10,000 to 12,000 feet, or 2 to 2½ miles, below the surface of the sea, extends along the bottom of the A. from Cape Clear in Ireland to Cape Race in Newfoundland, a distance of 1640 miles. Along this, which is known as the 'Telegraph Plateau,' the Atlantic cables are laid. The accompanying diagram exhibits the depths and temperatures in the track between New York and Bermuda:



Section of the North Atlantic Ocean between New York and Bermuda:
showing the Soundings in fathoms and Isothermal Lines obtained in H.M.S. *Challenger*, Captain G. S. Nares, 1873.

ATLANTIC TELEGRAPH, HISTORY OF. In 1842, Professor Morse of New York, having stretched a submarine cable between Castle Garden and Governor's Island, Boston, and succeeded in transmitting an electric current from one end to the other, expressed his opinion that it would be possible to effect an electrical communication through the sea. After further investigations, he announced to the Secretary of the Treasury of the United States, 'that a telegraphic communication on his plan might with certainty be established across the Atlantic.' Three years prior to that, Sir William O'Shaughnessy gave practical proof that electrical messages could be conveyed through water, by depositing a cable in the bed of the Hooghly; but it was the successful submarine telegraphic undertakings of the Messrs Brett, who, in June 1845, registered a 'General Oceanic Telegraph Company,' with the object among others of joining this country

with America by means of a telegraph 'across the Atlantic Ocean,' and six years afterwards united England with France (see TELEGRAPH, *History*), that first fairly convinced the public mind that the New World might be put on what may be called conversational terms with the Old. The supposed great depths of the Atlantic Ocean presented the most imposing obstacle to this desired closeness of communion; but when it was discovered that between Ireland and Newfoundland there extended, along the bottom of the Atlantic, at a depth of not more than two miles below the surface, a fine broad platform (see ATLANTIC OCEAN), seemingly so specially formed by nature for the purpose of electrical communication, that Captain Maury at once designated it the Telegraphic Plateau, the project of an Atlantic submarine cable assumed a practicable form. In 1854, the colonial government of Newfoundland passed an act incorporating a company to establish a telegraphic communication between the Old World and the New, and aided it by a subsidy, and by grants of lands. The colonial government also conferred upon the company the exclusive right of landing a telegraphic line upon the coast under its jurisdiction. The governments of Prince Edward's Island and the state of Maine made similar concessions; and authority for certain subsidiary operations in Canada was also obtained. The company, incorporated under the title of 'The New York, Newfoundland, and London Telegraph Company,' commenced operations by uniting St John's in Newfoundland with lines in the United States and British North America. This done, numerous preliminary experiments were undertaken by eminent electricians and engineers, in order to determine the amount of retarding force which inducted and disguised electricity were likely to offer to the transmission of currents along submarine wires of unusual length. Having by these experiments, 2000 in number, tried with 62 different kinds of cable, determined the one best adapted for the conveyance of electricity through such a length, and at such a depth in the Atlantic, the next step was the formation of a more influential company. In 1856, 'The A. T. Company,' to which all the privileges conferred on the old company were handed over, was formed with a capital of £350,000. The governments of Great Britain and the United States liberally aided the company, guaranteeing, by a contract of 25 years' duration, to pay to the company, until such time as its dividend reached 6 per cent., a subsidy of £14,000 a year, and of £10,000 subsequently. They also agreed to furnish ships for laying down the cable.

The cable, which weighed about a ton per mile, equal to 14 cwt. in water, was composed of a strand of seven wires of pure copper, coated with three separate layers of gutta percha, wrapped over with hemp saturated with pitch and tar, and finally bound round with iron wires, 332,500 miles of iron and copper wire being employed in its construction. It was deposited in the holds of the *Agamemnon*, a line-of-battle ship supplied by the British government, and the *Niagara*, a splendid frigate furnished by the United States, and the two vessels started on their grand mission. After two unsuccessful attempts during the years 1857 and 1858, the expedition started again for mid-ocean, whence the ships were to start, paying-out towards opposite shores, on the 17th of July 1858. The cable was united and lowered on the 29th of the same month; and the *Agamemnon*, notwithstanding a severe gale of wind, arrived at Valentia, having successfully laid her portion of it, on the morning of the 5th of August. The *Niagara* about the same time arrived in Trinity Bay, Newfoundland, and science had annihilated space between the Old World and the New. On the 17th August, the extremities of the cable having been put in connection with the recording-instruments, the following message was flashed through the ocean in thirty-five minutes: 'Europe and America are united by telegraph. Glory to God in the highest; on earth peace and good-will towards men.' Messages and replies from the Queen to the President of the United States, from the Mayor of London to the Mayor of New York, &c., followed. But on the 4th of September, the signals at Valentia became unintelligible. One commercial message of great importance passed through the cable, in reference to the collision between the Atlantic steamers, the *Europa* and *Arabia*; this single message saved the commercial world £30,000, which would doubtless have been spent in extra insurance on the vessels and cargoes thus delayed. The cable of 1858 having become useless, two other lines were laid in 1865 and 1866, and these two now connect Great Britain with North America. A third cable was laid in 1869 from France to the United States, and various other transatlantic lines are projected or in progress. See TELEGRAPH.

ATLA'NTIS, according to ancient tradition, the name of a vast island in the Atlantic Ocean. It is first mentioned by Plato, who represents an Egyptian priest as describing it to Solon, but, of course, according to Plato's view of the matter. In this description, A. appeared as an island larger than Libya and Asia Minor taken together, and lying off the Pillars of Hercules in the Atlantic Ocean. Plato gives a beautiful picture of the interior of this imaginary land, and enriches it with a fabulous history. Some early writers supposed that the Canary Islands were the remains of the old A.; for Plato had stated that at the close of the long contest which its inhabitants maintained against the Athenians, nine thousand years before his time, the sea suddenly engulfed the island, and had ever since been unnavigable, by reason of the shoals of mud created by the sunken island. Some found it in the Scandinavian peninsula; others (first Bircherod in 1685) have supposed that Phœnician or Carthaginian merchant-ships had been driven by storm on the coast of America, and that the supposed vast island of A. mentioned by Plato, as well as the great unnamed island spoken of by Pliny, Diodorus, and Arnobius, may have been the New World.

A'TLAS is that piece of the human vertebral column which is nearest to the skull; in other words, it is the first cervical vertebra. It may be known from the other six by its being without a body or spinous process, by its being a more irregular bony ring, partly divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the part in front being occupied by the tooth-like process of the second cervical vertebra, and that behind, by the spinal marrow. On each side, the ring is very thick; it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

The A., with the occipital bone, forms the joint on which the head moves in bowing; and turns on the pivot of the second cervical vertebra, when we look from side to side.

A'TLAS, according to Hesiod's *Theogony*, one of the Titans, the son of Iapetus and Clymene, and brother of Menœtius, Prometheus, and Epimetheus. Apollodorus, however, states him to have been a son of Asia, and Hyginus, a son of Æther and Gaea. He married Pleone, daughter of Oceanus (or Hesperis, his own niece), and became the father of the Pleiades. As leader of the Titans, he attempted

AS, a mass of ntain-land in the western North Afr Herodotus mentions a in of this name situated on the Little Syrtis, and twenty days' from the Garamantes, styled by pillars of heaven.' By later writers, of Polybius, the name A. was always chain of mountains in North-west extending from the island of Cerne (now Ger) north-west through Mauritania, and (now Fez and Marocco), and including ts dispersed through the region of divided into the Little Atlas and the former denominating a secondary country of Sous, and the other, the ains of Marocco. The A. is not properly -chain, but rather a very irregular mass of land formed of many chains various directions, meeting in mountain- connected by yokes, or short chains of height, and diversified still further by rv mountains and groups of mountains. its greatest height (13,000 feet) in only part where it rises above the and obtains the name of Jebel-el-Thelj, Mountains. Its highest peaks are Miltsin—south-east of the city of Marocco—Bibawan, main. The most southern chain diverging the central mass bears the name *Jebel-* heights approach the sea, and form ories jutting out into the Atlantic. ce, the A. gradually decreases in height east. In Algeria, the elevation is only in Tunis, 4476 feet; and in Tripoli, 3200 whole mountain-system is intersected by of the Muluia river, which flows through h-east part of Marocco, and falls into the an. The slopes on the north, west, and overed with vast forests of pine, oak, poplar, wild olive, &c. The valleys are and capable of cultivation with great A. seems to be chiefly calcareous in its The mineral wealth remains, however, ly unexplored, though copper, iron, lead, , &c., are stated to exist in abundance.

HERE (Gr. *atmos*, vapour, *sphaira*, ne name applied to the gaseous envelope ounds the earth. The existence of an A. matter of vital importance. We owe sence the possibility of animal and veget- , the modifying and retaining of solar transmission of sound, the gradual shading nto night, the disintegration of rocks, and nce of weather phenomena. In conse- action of gravity, the A. assumes the spheroidal stratum concentric with the rd s heavily on its surface. It exhibits, all t d bodies, the usual charac- s pressure, but its internal condition differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance, it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment. If a hollow glass globe of 5 or 6 inches in diameter be weighed first, when filled with air, and then, after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic inches of dry air, when the barometer is at 30 inches, and the thermometer at 60° Fahrenheit, weigh 31·074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in the A. as well as in water. If a glass globe filled with air and closed be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed, they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavouring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the A. must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely fails at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer, that in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the A. must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the A. has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal

force and the repulsive action of the particles on the other, are poised, and beyond which the latter forces on balancing the former force, the aërial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. From the observation of luminous meteors, it is inferred that it is at least 100 miles high, and that, in an extremely attenuated form, it may even reach 200 miles.

The *pressure* of the A. is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the A., is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 feet, from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13·6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13·6 times less in height than the column of water, or about 30 inches. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary barometers (q. v.). A mercurial column of 30 inches in height, and 1 square inch in section, weighs 15 lbs. (more accurately, 14·73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word *A.* is often employed to express this weight or pressure on a square inch of surface, so that when we speak, in Mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lbs. on the square inch. The pressure on a square inch being thus ascertained, we have merely to multiply it by the number of square inches on the earth's surface to obtain the total weight of the A. It amounts to 11·67085 trillions of lbs., or about $\frac{1}{1\,300\,000}$ of the earth's mass. It must be observed that the height of the barometric column is not a constant quantity, as it varies with the latitude, the season of the year, and the hour of the day. At London, its mean height is 29·88 inches; at Paris, 29·92 inches. The pressure of the A. in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° N. lat., and decreasing from 30° to 65°, where it again begins to rise. The greater height at 30° is said to be due to the accumulation of air at that latitude by the action of the trade-winds. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, we would expect that, during the year, the barometer would stand at a minimum in summer, and a maximum in winter. In reality, however, although the barometer is highest in mid-winter, there is another maximum in mid-summer, making thus two minima – one in spring, the other in autumn. This arises from the part which watery vapour plays in the pressure of the atmosphere. The heat of mid-summer introduces into the air a large quantity of moisture, in the form of elastic vapour, which, adding its pressure to that of the dry air, raises what would otherwise be the minimum barometric column to a higher point than that at which it stands in spring and autumn. Similar causes affect the pressure of the A. during the 24 hours of the day. There are two maxima—one at 10 A.M., the other between 10 and 11 P.M.; and two minima—at 4 A.M. and 4 P.M. Very slight variations indicate the existence of atmospheric tidal waves; but the subject is still involved in some obscurity. The pressure of the A. exercises a most important influence on the organism of the human frame. A man of ordinary stature is exposed to a pressure of about 14 tons; but as the air permeates the whole body, and presses equally in all directions, no inconvenience is found to result from it. From experiments instituted by the brothers Weber in Germany, it has been ascertained that the heads of the thigh and arm bones are kept in their sockets by the pressure of the A.; and in balloon ascents the aëronaut often suffers from bleeding at the nose, lips, and even eyes—a fact that would seem to indicate that the strength of the blood-vessels has been adjusted with reference to atmospheric pressure.

Chemical Composition of the A.—Recent chemical researches give the following as the mean composition of 100 volumes and of 100 grains of dry air:

	Volumes.	Grains.
Nitrogen, ...	79·02	76·84
Oxygen, ...	20·94	23·10
Carbonic acid, . .	0·04	0·06
	100·00	100·00

Besides the substances just named, other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the A., such as ammonia and ammoniacal salts, carburetted and sulphuretted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. Roughly speaking, then, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with a slight admixture of carbonic acid, and a mere trace of several other substances. As, however, the air of the A. is never found dry, we must add to the constituents already named watery vapour, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapour varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the A. is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of ozone (q. v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the A. The nitrogen which forms the bulk of the A. possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shewn by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the A. in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table

s that 10,000 volumes of atmospheric air
s of carbonic acid. If it occurred in
es proportion, being poisonous, it would
ous to animal life; and if it occurred
ll. less proportion, the vegetable world
ck its requisite nourishment. The other
s, of which a trace is always or only some-
nd in atmospheric air, are difficult to detect
lf. but are generally found dissolved in
e especially in that which has fallen
r a long drought. Of these, by far
p nt and widely diffused are ammonia
onia salts, which are of essential import-
the vegetable economy, because, dissolved
in, they furnish plants with the nitrogen
by them for the production of their flowers
. Nitric acid is detected in the air after
forms, sulphuretted hydrogen in the tainted
vers and such like places, and sulphurous
luric acid only in the neighbourhood of
or smelting works. A considerable quantity
ic oxide and carburetted hydrogen escapes

rises from both gases acting independently
ther in respect to the water, a condition
be impossible if they were in chemical
these and other corroborative facts,
dered to be simply a mechanical com-
of the gases contained in it. This, however,
prevent the A. from having a uniform com-
as might at first sight be supposed; for
es are mixed with each other, they inter-
thoroughly throughout the whole space
by them. Local causes may temporarily
e relative proportion of the atmospheric
ts, but the changes are so minute as to
st delicate analysis to detect them.

ATMOSPHERIC ELECTRICITY. Franklin
ed to establish the identity of the light-
he heavens with the electric spark. By his
ite-experiment, he ascertained that the
cloud assumes an electrical condition
similar to that of the conductor of an electrical machine, and that the same mechanical and luminous effects are common, though in a different degree, to both. The attention that was first directed by this discovery to the A. E., as displayed in the thunder-cloud, has since then been extended to the electrical condition of the air in all the different states of the weather. It is now found that the air is sensibly electrical not only when the sky is overcast with thunder-clouds, but when the weather is clear, or when no thunder-clouds are present. Observations on A. E. are made by delicate electrometers connected with insulated rods at the top of the building, or other collecting apparatus. The following are some of the results got by continental observers: When the sky is clear and free from clouds, the A. E. is always positive, and an electroscope exposed to the action of the air is charged with positive electricity. On the other hand, the electricity of the ground is found to be negative. This was shewn in a very ingenious way by Volta, who, by catching the fine spray of a fountain on the plate of a straw electroscope, found the straws to diverge with the negative electricity communicated to them by the water, which was necessarily of the same character as that of the ground. It is from this fact that electroscopes, or the collecting apparatus connected with them, must not be overtopped by the neighbouring trees or buildings, the negative electricity of which materially affects the indications given, and it is due to the same fact that no A. E. is discovered in the middle of a wood, or in a room, however high the ceiling. Under a clear sky, the potential of the A. E. is found to increase as we ascend, the lower aerial strata being less electrical than the higher. Becquerel proved this by a simple experiment on the plateau of Mount St Bernard. On a piece of oiled silk he placed a silk thread, covered with tinsel, one end of which, terminated by a ring, was connected with the rod of a straw electroscope, and the other end was tied to an arrow armed with a metal point. When the arrow was shot horizontally, the straws shewed no divergence; but when the arrow was shot upwards, they opened as it ascended, and diverged most when the arrow, in ascending, disengaged the ring from the rod of the electroscope. The same fact is shewn in the following way: When a very delicate electroscope is adjusted for any particular position, it will, when elevated a few feet above that position, give indication of positive electricity, and when placed a few feet below, it will be charged negatively. In clear weather, likewise, the A. E. is found to be subject to certain daily periodical variations, and appears to have two maxima and two minima in the course of twenty-four hours. The first maximum takes place a short time after sunrise, and the second shortly after sunset; the first minimum shortly before sunrise, and the second in the afternoon, when the heat of the day is greatest. In cloudy weather, the electroscope is affected sometimes positively, sometimes negatively, and is generally less influenced than in clear weather. The electricity of rain, snow, hail, &c., is sometimes positive, sometimes negative. In Stuttgart, for instance, it was found in the course of a year that the rain was 71 times positive to 69 times negative, and the snow 24 times positive to 6 times negative.

Sir William Thomson, in our own country, has made various observations on atmospheric electricity. His delicate electrometers give him not only great facility of observation, but their delicacy far transcends that of any instrument hitherto employed in such observations. Instruments such as his electrometers, that are sensitive to the electromotive force of a single Daniell's cell with any condensing contrivance, are a wonderful advance in observing power. Sir William's collecting appar-

atus is an insulated can of water placed inside a window, with a nozzle extending four feet and a half beyond the wall, the window being only open so far as to admit of the nozzle-tube passing without touching. The can, when the stop-cock is opened, assumes the potential of the air outside at the point where the jet breaks up into drops. In the portable electrometer for outside observations, he uses as the collector a burning match at the top of a long rod attached to the instrument. The collecting apparatus is, of course, insulated and connected with the electrometer. He estimates the amount of atmospheric electricity per foot or per inch. He calculates the difference of potential at the perpendicular distance, say, of a foot from any portion of the earth's surface, whether the level ground or an upright wall. He finds, as mentioned above, that the earth is always negative in clear weather, and the air positive, and that the difference of potential per foot is very different at different times. Thus, in the Isle of Arran, he found this to vary in ordinary fine weather from 22 to 44 Daniell's cells; with an east or north-east wind, the difference of potentials was from 6 to 10 times that per foot. He also finds sudden and unaccountable variations of potential within even comparatively few minutes, and he can only suggest that there may be cloudless yet cloud-like masses of clear air floating in the atmosphere, which are charged with electricity, and which, in their passage over or near the electrometer, give rise to these marked variations.

The cause of A. E. has given rise to much discussion. The electricity developed by evaporation and vegetation has been thought by some to account for the positive electricity of the air; but this view has been combated, and as yet no theory has been proposed which satisfactorily accounts for it. With the instrument that Sir William Thomson has placed in the hands of observers, and with a cordon of observers all over the world, data may be got for a satisfactory theory, but as yet our knowledge of the subject is too fragmentary to reach anything like a satisfactory account of it. For the electricity of the thunder-cloud, see LIGHTNING.

ATMOSPHE'RIC RAI'LWAY, a railway on which the locomotive-power is supplied by the pressure of the atmosphere more or less directly on the carriages themselves. The idea of producing railway locomotion in this manner has been successively prosecuted by Lewis, Medhurst, Vallance, and Pinkus; and latterly with a greater prospect of success by Clegg, in connection with Samuda. Vallance patented a plan which proposed the conveyance of passengers along a railway laid within an air-tight tunnel exhausted in front of a carriage working as a piston, the pressure of the atmosphere acting on the carriage from behind. This plan was made public in 1825, and ultimately brought into experimental operation at Brighton, proving the possibility of such a mode of transit. The general opinion as to its merits was, that though it might succeed in the transmission of goods, or, with a smaller tube than the tunnel, might suit well the conveyance of the mails, it could not be expected to enjoy the favour of the travelling public, on account of its dark close tunnel. Thus the subject of atmospheric railways had ceased to attract attention, when the curiosity of the public was again called to it, by the proposal of another plan of propulsion, by Henry Pinkus, an American gentleman, resident in England, who took out a patent for it about the year 1835, under the name of the Pneumatic Railway. The apparatus for this was to consist of a cast-iron tube of about forty inches diameter, having a slit of about two inches wide on its upper side, the slit (which was covered by a flexible flap or valve) furnishing an opening through which the mechanism of a piston working within the tube might be connected with that of the leading carriage without.

Under improved arrangements of the details, Messrs Clegg and Samuda made an experiment of this plan in 1840, on a part of the line of the West London Railway; and so favourable was the issue, that the directors of the Dublin and Kingstown Railway adopted the atmospheric pressure system for a projected extension of their line from Kingstown to Dalkey. Accordingly, parliamentary sanction was obtained for the line, and the first A. R. was in full operation at the beginning of the year 1844. In that year the London and Croydon Railway Company began to lay down a line of A. R. alongside of their locomotive line from London to Croydon. The South Devon Railway Company also adopted the atmospheric mode of working on a part of their railway. Both of these lines, however, was shortly afterwards abandoned as unsatisfactory.

The result of these trials has clearly shown that the A. R. system cannot stand in competition with that of the locomotive engine, unless, perhaps, in some very peculiar situation. The expense and care necessary to keep the tube with its valve in good working-order, led to the removal of the atmospheric mechanism from the various railways on which it was established; so that the history of Atmospheric Railways may be ranked under the chapter of failures. They survive only in the form of pneumatic despatch tubes, which are used largely in London (in connection principally with the telegraph service), for the conveyance of parcels of messages for short distances.

A'TOM (Gr. *atomos*, an indivisible particle; from *a*, not, and *temnō*, I cut). In ancient philosophy, two theories of the nature of matter were recognised, and these have continued to form subjects of argument among speculative men since the year 510 B.C. to the present time. The one theory is, that matter is infinitely divisible. Thus, a needle may be divided into two, and each of the parts may in its turn be broken or cut into two, and each of the latter again and again be subdivided, till the parts become so small that it may be impossible to see them by the naked eye; but these parts are regarded as capable of still further division, without limit or stoppage, provided more perfect or delicate means could be employed to act upon them. The second theory regarding the constitution of matter is, that in the repeated division and subdivision of a solid, liquid, or gas, a point will be at length reached when it will no longer be possible, by any considerable means, to break a molecule in two, the molecule being a real unity, not composed of separable parts—in other words, an *atom*. The latter theory recognises the finite divisibility of matter, and considers that all matter is more or less compactly built up of myriads of atoms aggregated together, and having spaces or pores between the several atoms or particles. If it were possible to subject such matter to the scrutiny of a sufficiently powerful magnifying glass, or microscope, and thus exhibit or behold the atoms so separated by spaces, then an appearance would be presented similar to that which the painter chooses to depict on the canvas when he is representing a snow-storm, and where every little flake of snow is separated from its neighbour one by a space in which there are none; or that which would be observed if, during a hailstorm, some great power were to cry, 'Halt!' and that instant every minute hailstone was arrested in the spot it had reached.

This view of the physical nature of matter is that which is known as the *atomic* or *corpuscular* theory, and has in modern times received some support

mbodied in the chemical atomic theory

MIC THE'ORY. Analysis shews that
d bodies contain certain elements (see
.) in certain proportions. These propor-
.. been minutely and carefully examined by
emists since the time when the balance was
plied to chemical investigation, and it has
ved that the respective quantities of each of
bining elements are not dependent entirely
ternal conditions, but are regulated by cer-
.. These laws were partially observed
essed by earlier chemists and physicists,
as reserved for Dalton (q.v.) to systematise
.. oherent labours of his predecessors,
.., in positive language, the four laws
.. the union of various kinds of
.. which are still acknowledged by
.. the LAWS OF COMBINING PROPORTION,
.. Atomic Theory. These laws regulate the
tion of unlike substances by *weight*, and
sume; and they are based upon the preli-
knowledged fact, capable of experimental
tion, that the same compound substance is
.. of the same ingredients or elements.
.. of combination by weight compre-
er the A. T. is THE LAW OF CONSTANT
.., which teaches that the elements or
.. which form a chemical compound are
l in it in the same proportion by
.. , water, which consists of oxygen and
.., does not contain one or both of these
.. in indefinite amount, but it is invariably
p of 8 parts by weight of oxygen to 1
.. t of hydrogen. It makes no matter
total amount of other element be
.. by grains, ounces, pounds, or tons, it
.. ys be found that the proportion of 8
oxygen to 1 part of hydrogen is kept up.
Neither does the source of the water make any difference, for pure water obtained from rain, snow, or hail, the river or the sea, the sap of plants or the juices of animals, invariably contains the same elements in the same proportions. Again, common salt (chloride of sodium), whether it be obtained from sea-water, salt-springs, rock-salt, or even the blood of animals, always consists of chlorine and sodium in the exact and never varying proportion of 35½ parts of chlorine to 23 parts of sodium. Whilst the law of constant proportion teaches us that the same compound is always built up of the same ingredients in the same proportion, it does not necessarily follow that the same elements or components in the same proportions will invariably form the same compound body. It is far otherwise; and many examples can be obtained, especially from organic chemistry, where the same components in the same proportions produce very different substances. Thus, starch and cotton (lignine)—very dissimilar substances—consist of carbon, hydrogen, and oxygen in the very same proportions; and gum-arabic and cane-sugar are similarly circumstanced. See ISOMERIC BODIES.

The *second law* is the LAW OF RECIPROCAL PROPORTION, which tells us that the proportions in which two substances unite with a third have a simple arithmetical relation to that proportion in which they unite with each other. Thus oxygen and hydrogen unite in the proportion of 8 to 1 to form water. Carbon and hydrogen are present in olefiant gas in the proportion of 6 to 1, and oxygen and carbon unite in the proportion of 8 to 6 to form carbonic oxide. Again we have a compound of oxygen and iron containing these elements in the proportion of 8 to 28; we have also a compound of sulphur and iron in the proportion of 16 to 28; and sulphur and oxygen unite together to form sulphurous acid gas, which contains equal weights of the two elements—the proportion of 1 to 1 having a simple arithmetical relation to the proportion 8 to 16.

Numbers representing the proportions in which the elements combine (such as 1 for hydrogen, 8 for oxygen, 6 for carbon, 16 for sulphur, 28 for iron, &c.), are called their 'combining proportions,' or *Atomic Weights* (q.v.). It is obvious that analysis alone cannot enable us to fix definitely such numbers. There is nothing in the *composition* of their compounds to lead us to adopt the proportional numbers given above for hydrogen, oxygen, carbon, sulphur, and iron, rather than simple multiples or submultiples of them. In fact, the numbers adopted by Berzelius, and now reintroduced, are in the proportion—hydrogen 1, oxygen 16, carbon 12, sulphur 32, iron 56. The reasons for preferring certain particular numbers to any multiples or submultiple of them will be found in the article CHEMISTRY in SUPP.

The *third law* is THE LAW OF MULTIPLE PROPORTION, which is, that when one substance combines with another in several proportions, the higher proportions are multiples of the first or lowest. Thus, hydrogen unites with oxygen in two proportions; as 1 of hydrogen to 8 of oxygen, when ordinary pure water is the result of union; and as 1 of hydrogen to 16 of oxygen, when peroxide of hydrogen, a powerful bleaching agent, is produced—the difference in the respective amounts of the oxygen—8 and 16—being, that the latter is a multiple of the former by 2. Again, carbon unites with oxygen in two proportions: as 6 of carbon to 8 of oxygen, when the inflammable gas, carbonic oxide, is formed; and as 6 of carbon to 16 of oxygen, when the non-inflammable gas, carbonic acid, is the result. The variation in this instance is, that the oxygen is present in the one

case as 8, and in the other as a multiple of that number by 2, viz. 16. One of the best illustrations of this law occurs in the case of the union of nitrogen and oxygen: 14 parts of nitrogen can unite with 8 of oxygen, and thus form laughing-gas; but the same amount of nitrogen can combine with 16, 24, 32, or 40 of oxygen—in the latter case constituting anhydrous nitric acid—all of the higher numbers being multiples of the first or lowest, viz. 8 by 2, 3, 4 and 5.

The *fourth law* is THE LAW OF COMPOUND PROPORTION, which teaches that the combining proportion of a compound substance is the sum of the combining proportions of its components. Thus, the compound body, carbonic acid, which consists of 6 of carbon united with 16 of oxygen, has the combining proportion 22, which is the sum of the combining proportions of the carbon and oxygen composing it, viz. $6 + 16 = 22$. Similarly, the compound substance lime contains 20 of the metal calcium combined with 8 of oxygen, and has the combining proportion of $20 + 8$ or 28. When carbonic acid and lime are linked together, as in marble, which is the carbonate of lime, then they are united in the proportion of 22 parts of carbonic acid and 28 of lime. Not only is 22 the proportion in which carbonic acid will combine with lime, but it is the proportion in which it will form compounds with every other substance of similar chemical constitution.

The preceding laws regulating the union of substances by weight have been obtained by comparing together the results of numerous experiments, and every careful analysis serves to confirm their accuracy. But Dalton's theory was not limited to the statement of these laws; it was also an attempt to explain them. It assumes that each elementary substance consists of extremely small indivisible particles or atoms; that the atoms of any one element are all exactly alike, but differ from the atoms of every other element. Among other points of difference, they differ in weight, and although the absolute weight of an atom is unknown, the weights of two atoms, one of one element, the other of another element, are in the proportion of the combining weights of the elements they belong to. Thus the combining weight of sulphur is twice that of oxygen: we do not know the absolute weight of an atom of either, but the A. T. assumes that each atom of sulphur is twice as heavy as an atom of oxygen. Further, Dalton's theory assumes that the ultimate particles of compound bodies contain a comparatively small number of atoms of the component elements. It is easy to see how this theory explains the laws enunciated above. We must, however, remember that while the theory satisfactorily explains the laws, the laws do not prove the theory. It is quite conceivable that such laws might exist, although matter did not consist of atoms. The A. T., however, rests not only on a chemical, but also upon a physical foundation. According to the modern molecular theory, matter consists of small particles, each of which is in motion, and this motion is the more rapid the hotter the substance is. These small particles or 'molecules' cannot be broken up without changing the character and properties of the substance. They are not, however, *atoms*. In the case of compounds, as the molecules of any *one* substance are all similar to one another, each molecule must contain all the components; and in many elementary substances it can be proved, assuming the truth of the molecular theory, that each molecule consists of several similar atoms. A molecule, then, is either a single atom, as in *some* elementary substances, or a group of atoms which remain together during those movements which depend on the temperature of the substance. Now, the velocity of these motions increases as the temperature is raised; when, therefore, the temperature is raised so high, and the velocity of the molecules becomes so great that the collision of the molecules with one another is sufficiently violent to break them up and separate their constituent atoms, the substance is decomposed, the atoms rearranging themselves into new groups (or molecules) capable of remaining unbroken under the new conditions. This explains the decomposition of compounds by the action of heat.

When the temperature is not so high, and the violence of collision insufficient to break up the molecules, these are merely shaken, thrown into a state of vibration, and thus the hold of the atoms upon each other is loosened. Now, if two substances are mixed together, it may happen that some atoms in the one set of molecules are so attracted by some atoms in the other set, that, when a molecule of the one set meets one of the other set in a vibrating or loosened condition, an exchange of atoms may take place between them, or each may loose a part of its atoms, these going to form a new molecule. This gives an explanation of the action of one substance upon another, and further shews why, in general, a certain temperature is required in order that the action may take place.

Gay Lussac first pointed out that a relation exists between the density of a gas and its atomic weight. Avogadro greatly simplified the statement of these relations by announcing the law of molecular volumes of gases, a law which Professor Clerk Maxwell has since proved to be a necessary consequence of the molecular theory of gases. This law is, that a given volume of gas at a given temperature and pressure contains the same number of molecules whatever be the nature of the gas.

From this law, to which we may give the name of 'Avogadro's law,' and from Boyle's law, and the law (often called Charles's law) that the volume of a gas is directly proportional to the absolute temperature—that is, to its temperature reckoned from a point 273° centigrade below the freezing-point of water—it follows that the volume occupied by a given mass of a gas is a function of the pressure, the temperature, and the molecular weight of the gas; understanding by the 'molecular weight' of a substance a number M, such that M : 2 :: the absolute weight of a molecule of the substance : the absolute weight of a molecule of hydrogen. The number 2 appears in this proportion because we assume the *atom* of hydrogen as our unit, both of atomic and of molecular weight, and it can be proved (see CHEMISTRY in SUPP.) that the molecule of hydrogen gas consists of two atoms. If, then, P be the pressure in millimetres of mercury at 0° C; t, the temperature of the gas, as indicated by a centigrade thermometer; M, the molecular weight of the substance; and V, the volume (in cubic centimetres) occupied by a gramme of the gas, $V = \frac{1}{P} \times \frac{t + 273}{273} \times \frac{22400}{M}$. In the gaseous state, the average distance between the molecules, although extremely small, is great compared with the size of the molecules, so that the volume of the gas depends almost exclusively upon the distance between the molecules: it is not so in the case of solids and liquids, in which the molecules are so closely packed as to be almost always in contact. The volume occupied by solids and liquids depends, therefore, far more upon the *atoms* of which the substance is made up, than upon its *molecular* structure. For further recent modifications of the atomic theory, see CHEMISTRY, in SUPP., Vol. X.

ATO'NEMENT. Sin violates the ground of union which the personal creature has, by nature, with the holy God. The act of sin is one of separation; the act begets the state of sin, the state confirms and repeats the act. The doctrine of the A. treats of the mediation necessary for restoring the union between God and man, which has been lost by sin. The A., therefore, must ever be the fundamental doctrine in every religion of sinful creatures. In the Christian religion, it manifestly occupies this central position; for the Christian doctrine of the A. is but the explanation of its great historic fact—the embodiment in one person of the Divine and human natures in perfect agreement. In the person of Christ, God and man are atoned: He is their Atonement.

So fundamental is the doctrine of the atonement in the Christian religion, that it does not, like many other doctrines, form a ground of distinction among the different bodies into which the Christian world has been divided. All churches may be said to be equally orthodox on this point. The Church of Rome, the Greek Church, the various Protestant churches—established and dissenting—all agree, taking their standards as a criterion, in resting the sinner's hope of salvation on the mediatorial work or atonement of Jesus Christ. Nevertheless, there have been from the very beginning of speculative Christian theology, and still continue to be, within the bosom of the several churches, various ways of conceiving and explaining the exact nature and mode of operation of this mediatorial work. What follows is a brief sketch of the historical development of these speculations.

Christianity differs from heathenism in the clear perception which it has of the antagonism sin has introduced between God and man. Heathenism but vaguely conceives of this variance, and consequently has but an ill-defined notion of the atonement required, the notion seldom containing more than the idea of a reconciled union of the individual man with nature and the universal life. Even where its mythical divinities assume personality, it is but an ideal personality without any concrete reality of life, and consequently without any real significance for the conscience. In this state, the abject subjection of man to nature prevents his rising into that sphere of conscious freedom which makes sin sinful, and demands an A. with one who is Lord both of nature and man.

In Judaism, man stands above nature, in conscious relation to a personal God, whose written law exhibits the requirements of His relationship with man—requirements which are never met, and which only make him fearfully conscious of the ever-widening breach between him and his God. Thus the law awakened the sense of guilt, and the desire for an A.; a desire it could never satisfy. The never-ceasing demands of these ever-unfulfilled requirements were constantly acknowledged by its whole sacrificial *cultus*, which expressed the hidden ground of Jewish hope, and prophetically pointed to its future manifestation.

But whilst the Holy Scriptures, throughout the

Old Testament, exhibit the making of an A. by vicarious sacrifice (Lev. xvi. 21; xvii. 11); and the idea, both of the suffering and the deliverance of many by the sins and virtues of one, was common to all antiquity, the idea of the suffering and vicarious Messiah, plainly declared in the writings of the prophets (Luke xxiv. 46; Isaiah liii.; Psalms xxii.), and not entirely hidden from the more thoughtful and devout contemporaries of Jesus (Luke ii. 34; John i. 29), was one which was foreign to the Messianic faith of the great body of the people.

In the New Testament, Christ is everywhere exhibited as one sent from God for the salvation of the world (John iii. 16, 17); and as the condition, on the part of man, of his obtaining this salvation, we read of the requirement of repentance, faith, and reformation (Matt. iv. 17; v. 3, 11; vi. 12; Mark xvi. 16; Luke xv. 11), whilst, on the part of God, as conditioning and mediating His forgiveness of sins, we have exhibited the entire life of Christ upon earth conceived of as embracing severally its individual features (Acts v. 31; Rom. iv. 25; viii. 34); but more especially His death as a ransom for our sins (Matt. xx. 28; xxvi. 28), as a vicarious sacrifice (1 Peter i. 19; 2 Cor. v. 21), by which we are redeemed from the bondage of sin (1 Tim. ii. 6; Gal. iii. 13; 2 Peter ii. 1), and obtain forgiveness (Rom. v. 19; 1 Cor. xv. 3; 1 John i. 7), and eternal life and peace with God (John x. 11; Col. i. 20). Christ is therefore the Mediator between God and man (1 Tim. ii. 5), having made peace through the blood of His cross (Col. i. 20); the propitiation for our sins (1 John ii. 2; iv. 10); and our high-priest who offers Himself a sacrifice to reconcile us with God (Heb. ii. 17; v. 1; ix. 28). Moreover, we are also taught that God has in Christ reconciled the world with Himself (Rom. v. 10; Col. i. 22; 2 Cor. v. 19).

In accordance with this full and explicit teaching of Holy Scripture, we find that the sufferings and death of Christ were ever regarded as of primary and essential importance in His work of redemption; but notwithstanding this, we look in vain throughout the early centuries of the Christian Church for anything like a systematic development of the doctrine of the Atonement. The germs of the doctrine existed, but without any logical connection or clearness. 'On this head there has been a twofold mistake—sometimes the existing beginnings of many later elaborated dogmas have been overlooked; or, on the other hand, it has been attempted to point out with literal distinctness church doctrines as if already developed.' The early church fathers dwell with a sort of inspired devotion upon those facts of the gospel which represent Christ as the sacrifice for our sins, as the ransom paid for our redemption, as our deliverer from the power of Satan, as the restorer to mankind of whatever was lost by the fall of Adam; but they seldom *attempt* to shew *how* these blessed results connect themselves with the sufferings and death of Christ; neither do they shew in what manner the A. has objectively been made, nor how it is brought to the experience of its individual subjects.

The narrow limits of this article will not allow us to specify the many ways in which the sufferings and death of Christ were regarded in relation to their A. for sin. During the first four centuries there appeared no certainty of opinion as to whether they were a ransom-price paid to God or to the devil. The latter supposition is the more prevalent, and is shared in by Origen and St Augustine. Gregory of Nyssa explains this opinion by saying, that the devil consented to receive Jesus as a ransom, because he regarded Him as more than an equivalent for all those under his power; but that, notwithstanding his subtilty, he was outwitted, for, owing to the humiliation in which Christ was veiled, he did not fully recognise Him as the Son of God, and consequently was himself deceived. But having consented to receive Him as a ransom for mankind, he was righteously deprived of his dominion over men, whilst he could not retain Jesus when he discovered Him to be the Holy One of God, being horrified and tormented by His holiness.

Athanasius first of all successfully controverted this notion, and maintained that the ransom was paid to God. He argued that as God had threatened to punish transgressors with death, He could but execute His threat. But then it was not becoming the character of God to allow His purpose in the creation of man to be frustrated by an imposition practised upon him by the devil. The only expedient, therefore, which remained for his deliverance from death, was the incarnation and sacrifice of the Logos in his stead, by which the justice and veracity of God would be maintained, man delivered, the law fulfilled, and the power of the devil broken. It has often been stated that Tertullian was the first to use satisfaction with respect to Christ's A. for sin, but this is incorrect, for although he employs the term, he never does so in the sense of a vicarious satisfaction, but only in the sense of making amends for our own sins by confession and repentance.

These elemental and mythical conceptions of the doctrine of the A. remained in a state of altogether undeveloped condition until the subtle genius of the Pi[illegible] Canterbury reduced [illegible] them in logical c[illegible] Anselm, therefore, as [illegible] or, as [illegible] form, of the doctrine of vicarious satisfaction under various modifications, has ever since to be held as the orthodox do[illegible] The following is, in all essential agreement of the doctrine: The in[illegible] had contracted, by the [illegible] the infinitely great God, [illegible] mere creature; only the God-man Christ can render to God the infinite satisfaction God only can satisfy Himself. The human Christ enables Him to incur, the divine nature to pay, this debt. [illegible] bent upon Christ as a man to ren[illegible] ing to the law of God; the ob[illegible] therefore, was not able to render guilt. But although He was un[illegible] in obedience to the law, as the [illegible] under no obligation *to die*. Sec[illegible] nevertheless voluntarily surrender[illegible] precious life to the honour of God from God became His due, consists in the forgiveness of t[illegible] —In this form of the do[illegible] necessity of an active vi[illegible] Anselm nowhere teaches the passive, nowhere says that Christ endured [illegible] men. Nor do we find in his wri[illegible] ment of the subjective side of the [illegible] how the satisfaction rendered to [illegible] A. in the experience of the [illegible]

Subsequent to the time [illegible] the Reformation, there are two [illegible] divide the opinions of this p[illegible] the peculiar manner in wh[illegible] it was — as absolutely necessary, and derivi[illegible] from its objective nature; the [illegible] subjective connection between [illegible] Jesus and the price of red[illegible] ti[illegible] best fitted to effect the [illegible] According to A[illegible]

on His delivering us from its curse. He
refore, exhibit His active obedience sepa-
ssential part of His satisfaction for sin,
obedience. The importance attached
of His life arises from its natural and
action with His suffering and death.
importance attached to His death is
from the view of its subjective neces-
upon the idea of the divine righteousness—
, that without such a death there would have
sufficient ground for the subjective realisa-
deliverance from sin and guilt. Calvin's view
from that of the Lutheran *Concordienformel*
he does not regard the relationship of God to
from the stand-point of punitive and
satisfying righteousness, which always leads to the merely negative notion of a Redeemer from guilt and punishment, but looks upon Christ as the highest Mediator, through whom the nature of God is communicated to man. There was a necessity for Christ's incarnation, not merely because, apart from the suffering of the God-man, the divine righteousness could not be atoned, but also because, without such a divine Mediator, there could be no vital relation between God and man. 'Had man remained free from all taint, he was of too humble a condition to penetrate to God without a Mediator.'

While the reformers established the doctrine of the A. on the theory of Anselm, and extended it so as to make the sufferings of Christ include the Divine curse, and introduced distinctions between Christ's active and passive obedience, Socinus endeavoured to prove the falseness of Anselm's theory. He shares with the Protestants the subjective principle, which the period of the Reformation established, but developed it in a one-sided manner. Socinianism represents man as attaining to oneness with himself and with God by his own moral energy. It rejects that idea of the righteousness of God which makes it impossible for Him to forgive sin without a satisfaction, as imposing finite limitations upon the divine Being; and also objects to the doctrine of satisfaction, on the ground that satisfaction for sin and forgiveness of sin are incompatible with each other; and, moreover, objects that sin and punishment are of so personal a nature as not to allow of their being transferred. It further opposes the doctrine of the active and passive obedience of Christ, on the ground, that the one excluded the other. Another objection maintained the actual impossibility of Christ's rendering the supposed satisfaction for sin.

The doctrine it sought to establish in the place of the one it attempted to overthrow may in brief be stated as follows. Man is reconciled to God by repentance and reformation. Only from an act of man changing his disposition, and not from an act of God changing His relation to man, follows his reconciliation with God. God is in Himself ever the same towards man reconciled from all eternity; man alone has to assume a new relation; as soon as he does this, he is immediately reconciled; by this act of his will, he is at one with God. Only in man's moral state is there any obstacle to his reconciliation. This greatest and holiest accomplishment, the reconcilhation of man with God, is achieved by an act of his will.

In this purely subjective theory, repentance occupies the place of faith in the orthodox doctrine, and faith becomes identical with obedience; for repentance and reformation are regarded as but the two sides of the same act of the will. It follows from this that justification is of works as well as reconciliation. A necessity for the sufferings of Christ is shewn for the following objects—that He might become our example; better fitted to render us help; that we might have a pledge and guarantee of the Divine forgiveness; and as conditioning His resurrection and ascension to glory.

We must now hasten to the form of this doctrine among 'Modern Calvinists,' without attempting further to exhibit the links in the chain of its historic connection. 'Modern Calvinism' represents the A. as that satisfaction for sin which was rendered to God, in His public character as moral governor of the world, by the perfect obedience unto death of our Lord Jesus Christ. The nature of this satisfaction was a moral, not a pecuniary satisfaction. It preserves to the moral government of God its authority, whilst its tendency is to secure the forgiveness of sin. The value of the sufferings of Christ consists in their tendency to uphold the Divine moral government

unimpaired whilst pardon is extended to those who have violated it, rather than in their intrinsic excellence, which, though essential to, did not constitute their value. There was a moral necessity for Christ's sufferings and death—obstacles to the bestowment of pardon had to be removed—the influence of the Holy Spirit had to be secured. The whole contents of Christ's earthly existence, embracing both His active and passive obedience—a distinction which is unsupported by the word of God—must be regarded as contributing to the A. which He made. Of the actual sufferings of Christ immediately attending His death, it would be unpardonable to speak with confidence, so little has been revealed. It may, however, be considered—whether the Saviour's deprivation of His Father's countenance may not have been indirectly caused rather by His awful and afflicting sense of the evil of sin, than otherwise?—As to the 'Extent' of the A., there is a broad distinction to be made between the *sufficiency* of the A., and its *efficiency*. It may be true that Jehovah did not intend to exercise that influence of the Holy Spirit upon all which is necessary to secure the salvation of any one, but as the A. was to become the basis of moral government, it was necessary that it should be one of infinite worth, and so in itself adequate to the salvation of all. The body called Universalists (q.v.) hold both the efficiency and ultimate sufficiency of this great event in history.

The foregoing represents the modified view of the doctrine as advocated by Dr Payne, and as held, in all essential respects, by such men as Pye Smith and Wardlaw, which in its earlier form, and as found in the writings of Owen and Edwards, maintains that the A. was made only for the elect; and that its necessity with respect to them arose out of the eternal justice of God, which required that every individual should receive his due desert; and, consequently, that the sufferings of Christ were the endurance of punishment equivalent in amount of suffering, if not identical in nature—as Owen maintains—with that to which the elect were exposed; and, moreover, that the meritorious obedience of Christ in fulfilling the law, imputes a righteouness to those for whom the A. secures salvation, which gives them a claim to the reward of righteousness.

Our space will not allow us to present to the reader the various forms which this doctrine is made to assume in the philosophic theology of Germany from Kant to the present time. See NEANDER. We must, therefore, confine ourselves to the presentation of those views of the doctrine advocated by our own countrymen in our own time, which may fairly represent the present state of opinion with respect to this fundamental doctrine.

Let us begin with the view of modern Unitarianism, which may very clearly and fairly be presented in the words of one of the most able of its advocates, the Rev. Professor John James Tayler: 'There is one mediator between God and men, the man Christ Jesus.' This can only refer to [illegible] not to exclusive function. For all higher minds do in fact mediate between the lower, and all revelations and the great mediator of the invisible world. This 'man' is a [illegible] that is 'the man Christ Jesus'—not a being from another sphere, an angel or a God—but a brother man, one of our own human family. 'He gave himself a ransom for all' who embrace His offers and will hearken to His voice. He brings from God a general summons to repent, and with it He conveys, through faith, a spiritual power to shake off the bondage of sin, and get on the freedom of a new heart and a new life. He is a deliverer from the power of sin and the fear of death. This is the work of His mediation. This is the redemption of which He paid the price. I [illegible] by met in the inevitable sequence [illegible] only one among many links in [illegible] mentalities by which that de[illegible] It was a proof such as could [illegible] in [illegible] way, of trust in God and immortality, of [illegible] to duty, and of love for mankind. In [illegible] earnestly contemplated it, and [illegible] implied, it awoke a tender response of [illegible] confidence, which softened the obdu[illegible] opened it to serious impressions and influences of a religious spirit.'

Professor Jowett advocates an opinion peculiarly his own, if, indeed, language so confusedly vague and indefinite can be said to embody an opinion. It is this: 'that the only sacrifice, A., or [illegible] with which the Christian has to do, is a spiritual one; not the pouring out of blood on earth, but the living sacrifice "to do" in which the believer has part as to about the meaning of which question in our day than [illegible] —'Heathen and Jew [illegible] what the sacrifice of [illegible] was. They are the dim, [illegible] rude, barous expression of that [illegible] in [illegible] which has received satisfaction in Him [illegible] are afraid of something; they wish to something; they feel themselves [illegible] thing; the fear is done away, the obligation fulfilled in Christ. St [illegible] can no more occupy [illegible] lead a better life; [illegible] world, and at the beginning [illegible] work of Christ is set forth in [illegible] different figures, lest we should rest [illegible] His death, for instance, is described as [illegible] It is not that God needs some [illegible] He will set the captive free. E[illegible] ance to the capture. [illegible] is the servant of sin.' [illegible] 'If the Son shall make you [illegible] indeed.' To whom? for what paid? are questions about which [illegible] to which reason refuses to answer.

A remarkably original work, [illegible] years ago, by the Rev. J. [illegible] on the subject of the At[illegible] as follows: The work of [illegible] to do and did the will of His [illegible] view of the deliverance which [illegible] regarded as twofold: first, as done behalf of God, and second, as done behalf of man.

In dealing with man on [illegible] revealed to us the Father in [illegible] world, shewed us what [illegible] cated in the world the F[illegible] to the excellency of that [illegible] rebellion. In thus revealing the [illegible] towards sinful men. He necessarily [illegible] sorrow and suffering, but these arose [illegible] what He was, and the relations in which those for whom He suffered [illegible] and love of His very [illegible] awful intensity and [illegible] suffered what He su[illegible] and sinners with God, [illegible] ence to them with God's heart. He condemned sin, and revealed against it. His holiness and [illegible] suffering, compose the very [illegible] of His sacrifice for sin.

As to its bearing with God [illegible] sense of mind with [illegible] took the form of

ing with the Father in relation to us a confession of our sins, which was a perfect humanity to the judgment of God on the Such an Amen was due in the truth of due on our behalf, though we could not due from Him as in our nature and our He who was the truth, could not and not utter it; and it was step in dealing with the Father on confession of our sins by Him who, of God and the son of man in one person, tly realise the evil of man's alienation, eculiar development of the holy sorrow in e bore the burden of our sins; and which, sufferings in confessing His Father before l a severity and intensity of its own. But the sufferings present in that confession, m the depths of the humanity of Christ condemnation of sin, is necessarily con- the reception of the full apprehension n of the wrath of God, as well as of st which it comes forth into His soul into the bosom of the divine humanity, eiving it, He responds to it with a perfect in that perfect response He absorbs it. all the elements of a perfect , for all the sin of man—a w— perfect contrition—all the ele- h a repentance, and that in absolute l—excepting the personal consciousness by that perfect response or amen to the God, in relation to sin, is the wrath of God and that is awarded to divine justice ine. and could alone satisfy it.

n of the world's sin by the Head and of humanity, was followed up by His a part of the full response of the Son to the mind of the Father—a part of nce in humanity which propitiated the y by the righteous way in which it laid hope for man which was in God. 'He of many, and made intercession for s.'

D. Maurice professed to hold a purely ology, as opposed to the theologies of con- which he repudiates. His doctrine of the swer which the Bible gives to the demands smitten conscience. A sinner requires, and st to be told on the authority of Scripture, Son of God has taken away sin. This from God is the gospel for all men. The rants to be assured that God has spoken, has declared Himself the Reconciler, and to be shewn how and in whom He has ished that work on his behalf.

e question—How and in whom the work of tion has been accomplished?—Mr Maurice effect and almost in words as follows: f God is set forth in the Bible to be a will ed to all, and the ground of all that is just, and gracious; that it also sets forth of God as being one in will, purpose, and e with the Father, and that His whole life was an exhibition of, and submission to His will; that the Son of God was Lord of Root and Head of humanity, and the source ght and righteousness in man: that being with God and one with man, He brought of God into our nature, fulfilled it in our erfectly, and carried it down into the lowest e into which it had fallen through sin; that ulfilment of this will in our nature, as its shared its sufferings, enduring that wrath, dignant, which proceeded from Holy Love, on the one hand, the sins of the world, er, the consuming fury of the holiness of the love of God—with an anguish which only a perfectly pure and holy Being, who is also a perfectly sympathising and gracious Being, can feel: that the man Christ Jesus was for this reason the object of His Father's continual complacency—a complacency fully drawn out by the death of the cross—which so perfectly brought out to view the uttermost power of self-sacrifice which lay hidden in the divine love, and consequently that He exhibited humanity, in its head, atoned for, reconciled. In this way, to Mr Maurice, is Christ 'the Lamb of God, which taketh away the sin of the world.'

Finally, Dr Trench, who may be regarded as fairly representing the prevalent views of the more devout and thoughtful men of the present day holding orthodox opinions, speaks as follows: 'The spirit of man cries out for something deeper than repentance, confession of sin, amendment of life; something which shall reach further back; which shall not be clogged with sinful infirmities, as his own repentance even at the very best must be. Men cry for some work to rest upon, which shall not be *their* work, but which shall be God's; perfect, complete. They feel that there must be something which God has wrought, not so much *in* them as *for* them; they yearn for this, for A., propitiation, ransom, and conscience purged from dead works by the blood of sprinkling; a rock to flee to which is higher than they, than their repentance, than their faith, than their obedience, even than their new life in the spirit. Now, this rock is Christ; and John the Baptist pointed to this rock, when, to those about him who longed after more than amendment of life, he exclaimed, in the memorable words: "Behold the Lamb of God which taketh away the sin of the world."'

Christ's sacrifice was vicarious—He died not merely for the good of, but in the room and in the stead of others, tasted death *for* them. He did this of His own free will. He saw that nothing else would overcome their sinful perversity and wilful obduracy, and that this would be effectual to do so.

Christ took upon Himself the penalties of a sinful world, and His self-sacrifice is only *not* righteous, because it is so much better than righteous, because it moves in that higher region where law is no more known, but only known no more because it is transfigured into love. Vicarious suffering is the law and condition of all highest nobleness in the world. It is this which God is continually demanding of His elect, they approving themselves His elect as they freely own themselves the debtors of love to the last penny of the requirements which it makes.

But the sufferings and death of Christ were not merely vicarious, they were also satisfactory; and thus atoning or setting *at one*, bringing together the Holy and the unholy, who could not have been reconciled in any other way. It is not maintained that God could have pleasure in the sufferings of the innocent and the holy, and that innocent and holy His own Son; but only that He must have the highest pleasure in the love, the patience, the obedience which those sufferings gave Him the opportunity of displaying, which but for those He never could have displayed. Christ's sublime devotion to the will of God permitted the Father to say, 'I have found a ransom.' Christ satisfied herein, not the divine anger, but the divine craving and yearning after a perfect holiness, righteousness, and obedience in man; which craving no man had satisfied, but all had disappointed, before.

The reader is referred for further and fuller information on this subject to the following works, which have been consulted and used in the preparation of this article: Baur's *Christliche Lehre von der Versöhnung;* Hase's *Hutterus Redivivus;* Neander's

J.) *Christian Aspects of Faith and Duty* (Discourse on 'Christ the Mediator'); Maurice's *Theological Essays;* Jowett's *St Paul's Epistles*, first and second editions (Article 'On Atonement and Satisfaction'); Trench's *Five Sermons* (sermon on 'Christ the Lamb of God').

ATRA'TO, a river of New Granada, more important from its position than from its magnitude. It has already been mentioned under the head of AMERICA in connection with the scheme of opening a communication by water between the Atlantic and the Pacific.

The main stream falls into the Gulf of Darien by 9 mouths—the quantity of water, from the almost daily rains, being large in proportion to the area drained, which does not, at the utmost, exceed 300 miles by 75. Of the 9 mouths, the third in rank, the Boca Coquito, appears to offer the most available facilities for improving the navigation. About 220 miles above this entrance, opposite to Quibdo, the A. is 850 feet wide and 8 feet deep at the shallowest parts, while the entire fall to the sea averages less than 3 inches to a mile. Unfortunately, however, the A. itself cannot advantageously be followed thus far, because, as one advances to the south, the intervening ridge to the west, and its streams towards the Pacific become less and less practicable.

But a comparatively convenient route has been surveyed through the munificence of Mr F. M. Kelley, a private citizen of New York. Ascending the Boca Coquito as before, this route leaves the main stream at a distance of 63 miles from the sea, following the Truando, one of its western affluents, for 36 miles more without impediment or interruption. From this point on the Truando to the Pacific there would still remain 32 miles; and it is only on this section that any serious difficulties would be found. The heaviest work would be a tunnel of 3½ miles in length. According to the plan, the canal would be without a lock; and its *termini* would require but little improvement to render them excellent harbours.

Thus would the A. realise the destiny which Humboldt chalked out for it upwards of 60 years ago.

ATRIP. An anchor is said to be A. when it is just drawn out of the ground in a perpendicular direction. A top-sail is A. when it is just started from the cap.

ATRIPLEX. See CHENOPODIACEÆ and ORACHE.

A'TRIUM, in Roman Architecture, was the covered court or entrance-hall which formed the chief part of a Roman house. It was lighted from the roof, which sloped towards an opening in the centre (the *compluvium*), through which the rain-water flowed into a kind of cistern situated on the floor (the *impluvium*). On both sides, passages led to the several chambers. Its size was in proportion to the other parts of the house. After the burning of Rome in the reign of Nero, great attention was paid to the decorations of the entrance-halls or *Atria*. Here the female slaves were engaged in weaving and other domestic occupations, under the superintendence of their mistress. Family pictures were preserved in the A., it also contained the nuptial couch, and it served as a general waiting-room for visitors and clients. The Atria of the temples were used as places of assembly of the senators, and for other public meetings.

A'TROPA. See BELLADONNA.

A'TROPHY (Gr. *atrophia*, want of nourishment; from *a*, not, and *trophé*, nourishment) is a morbid condition of animal or vegetable life, resulting in deficient nutrition of the body, or part of the body, and a consequent decay and waste of its substance. The term is not applied to the mere withholding the requisite supply of nutriment, but to the condition produced by various diseases that affect the body. See NUTRITION, also DIGESTION, DYSPEPSIA, HYPERTROPHY.

A'TRYPA, a genus of fossil brachiopod or lamp shells, having a close resemblance to the well-known *Terebratula*. It possessed a perforation for the sage of the peduncle, by which the itself to foreign bodies. This f in all examples of the same s touching and overlying the umbo of the animal was, therefore, probably portion of its existence. The name (d without, and *trypa*, foramen) was given t by Dalman, as he erroneously supposed perforation was entirely absent. Ju markings on the interior of seems to have differed little *conella*, except that it had lar for the support of its labial append strictly palæozoic brachiopod, the sol species being the last representative o Of the 179 described species, 100 are Devonian, 22 Carboniferous, and 1 Pe

ATTACHÉ (French), a subordinate o The term is generally applied to yo who accompany embassies.

ATTA'CHMENT is an English l fying the form of process, by the a the person or the goods of a debtor satisfaction. As a proceed is a species of criminal p of much that will be (q. v.); but in strictness, i from a court of record a of a contempt, or, more properly, of a tempt, and who is punishable in a summ by the court in whose presence, against w rity, or against whose writs the cont overtly displayed. Thus, in the Crown, such contempts 1. Disobedience to the Queen's in the face of a court; 3. C writings concerning a court; with the rules and awards of a c gery of writs, or any other deceit tendi on a court. Parties are also liable to t A. as for a contempt of court whe tion (see ARBITRATION) the award a rule of court under the 9 the parties refuse to obey th there may be A. of the person f other offence to the court, as, for e defendant fails to put in his answer to the plaintiff's bill of complaint. The process of A. against the person which it is here to notice, is the non-attendance in witness, who in such event is co committed a contempt of court, an be punished for such contempt by action may also be brought witness at the suit of th account of any loss or d non-attendance.

The ...pers approach at a trot, break into a gallop at a ...ance of one or two hundred paces from the enemy, ...endeavour by their weight and impetuosity to ... the enemy's line. There are many forms of ... attack, according to the nature of the ground and the position of the enemy. The artillery, working at a distance, often begin an attack long before the infantry and cavalry can come up, harassing and confusing the enemy. At 800 to 1200 yards' distance, the artillery pour out shot and shell, and try to silence the enemy's guns, so as to make way for the attack of the infantry; while the bayonet-charge is being made, the artillery keep in check the enemy's cavalry. If the attack succeeds, the infantry and artillery take up the ground recently occupied by the enemy, leaving the cavalry and riflemen to maintain a pursuit; but if it fail, the artillery and cavalry take up such positions as will cover the retreat of the infantry.

In an attack upon a fortress, the operation is a part of that of besieging (see SIEGE); but very often intrenchments are attacked in the open field. Such an attack has the character of a surprise, when the works are approached under cover of night, and an attempt is made to break into them on all sides. In such case, there is a reserve corps, which is rapidly brought up when wanted; but the attacking corps retire behind the reserve, if repulsed. The artillery post themselves on the prolongation of the line of works, and try to dislodge the enemy's guns and gunners; or pour a concentric fire sufficient to breach the works. The infantry advance as close as will enable them to fire upon the gunners. When the enemy's fire is silenced, the engineers (under cover of the artillery) proceed to remove palisades and all other obstacles, and to bridge over ditches and openings. Then follow the operations of the storming-party, analogous to those noticed under ASSAULT.

ATTAI'NDER is the legal consequence of judgment of death or outlawry, in respect of treason or felony. It is said to have been derived from the Latin word *attinctus*, attaint, stained, and it is followed by *forfeiture of estate*, real and personal, and by *corruption of blood*; and generally it imported extinction of civil rights and capacities. Thus, an attainted person cannot sue in a court of justice; he loses all power over his property; and he is by his A. rendered incapable of performing any of the duties, or enjoying any of the privileges of a free citizen. But absolute and severe as the consequences of A. seem to be, they had their limits. In regard to the attainted person, neither the government nor the crown could exercise absolute or capricious authority; everything must be done according to legal and constitutional principle and rule, and for the ends of public justice alone. Formerly, an attainted person could not give evidence in a court of justice; but that disability in England has been removed by the 6 and 7 Vict. c. 85, and in Scotland by the 15 and 16 Vict. c. 27.

We have stated that the immediate consequences of A. were *forfeiture* of estate and *corruption of blood*. The forfeiture was of estate real and personal. But in 1870 the law on this subject was revised and made more consistent with reason by the act 33 and 34 Vict. c. 23. No conviction for treason or felony now causes any A. or corruption of blood, or forfeiture or escheat. When a convicted person is sentenced to any punishment more severe than twelve months' hard labour, he is deprived of any public office or employment, and of any public pension, or of the right of voting at elections. He may be condemned to pay the costs or expenses incurred in procuring his conviction, and in cases of felony to make payment of a sum not exceeding £100, as compensation for any loss of property caused by such felony. He cannot sue for any property, debt, or damage. While he is a convict undergoing any imprisonment, her Majesty may appoint paid administrators to take charge of his property at

the convict's expense, to deal with the property, and pay debts, and do what is needful. They may also pay out of his property satisfaction for any loss or injury suffered by third parties in consequence of his criminal or fraudulent acts, though no proof of such criminal or fraudulent acts may have been made in any court of law. They may also make allowances to support the convict's family. If the crown does not appoint an administrator, justices of the peace may appoint interim curators, if satisfied that it will benefit the convict or his family, or the due administration of his property and affairs. Should any person intermeddle with the convict's property, the Attorney-general or next of kin might call them to account. When the convict ceases to be such, by the expiration of his sentence, then the administrators or curators are to account to him for all his property, or rather the surplus, like any other guardians appointed by law. If during the sentence any property be acquired by the convict, it is not to vest in the administrators, but is to be his own, as in other ordinary cases.

The old consequence of A.—viz., *corruption of blood*, is anxiously and learnedly treated of in old law-books, and in Blackstone's *Commentaries;* but the ancient law on the subject had been so much narrowed in its application by modern legislation as to have lost much of its importance; and, indeed, this doctrine of corruption of blood was in modern times always looked upon as a peculiar hardship, at least as regards the family of the offender; and now, by the statutes 54 Geo. III. c. 145, already referred to, 3 and 4 Will. IV. c. 106, and 13 and 14 Vict. c. 60, whatever savoured of inhumanity or harshness under the ancient system has been effectually removed; in fact, it is now enacted that, even with the cases of treason and murder, the law of corruption of blood, so far as the family of the offender are concerned, has ceased to form part of the law. Besides A. by the operation of law as above stated, there have been frequent instances of attainders by express legislative enactment, as to which, see BILL OF ATTAINDER.

The Scotch law of A., consequent on a conviction for treason, corresponds to the English doctrine; and although the word A. is not a Scotch technical term in regard to crimes other than treason, the forfeitures consequent on conviction and judgment are very much the same as the English.

ATTAI'NDER, BILL OF. See BILL OF ATTAINDER.

ATTAI'NT, WRIT OF, was anciently a mode of inquiring whether a jury had given a false verdict, which has been abolished by the 4 Geo. IV. c. 50. A. is, however, still in use to some extent as a technical word in the law of England; thus, there is the plea of *autrefois A.*, or of a former attainder, for the same crime, and now regulated by the 7 and 8 Geo. IV. c. 28, s. 4.

In the old Scotch criminal law, A., or *attaynt*, signified a conviction, or being convicted.

ATTALE'A, a genus of Palms, comprising a number of species, natives of the tropical parts of South America. They have in general lofty cylindrical smooth stems, but there are some stemless species. The leaves are large and pinnate. The fruit has a dry fibrous husk, enclosing a nut with three cells and three seeds. The leaves of some species are much used for thatching, and those of some are woven into hats, mats, &c. The nuts of *A. excelsa* and of *A. speciosa* are burned to dry the India-rubber obtained from the *Siphonia elastica*, which acquires its black colour from their smoke. The leaf-stalks of *A. funifera*, which is found in the maritime provinces of Brazil, and is there called Piassaba, yield a fibre much used for cordage. The ropes made of it are very strong, and extremely durable in salt water. The Piassaba palm of the northern parts of Brazil, however, is totally different, and much of the Piassaba (q. v.) fibre imported into Britain is obtained from it. The fruit of *A. funifera*, known by the name of Coquilla nut, is as large as an ostrich's egg, and supplies a kind of vegetable ivory, used for making umbrella handles, &c. The fruit of *A. compta*, the Pindóva or Indaiá palm, is of the size of a goose's egg, and the kernels are eatable. It is a stately and beautiful tree, with a wide-spreading crown.

A'TTAR. See OTTO.

ATTEMPT to commit a felony or criminal offence is in many instances equally cognizable by the criminal tribunals with the completed crime itself. See TREASON, FELONY, MISDEMEANOUR.

A'TTERBURY, FRANCIS, Bishop of Rochester, was born on the 6th of March 1662, at Milton, near Newport Pagnel, in Buckinghamshire, and educated at Westminster School, from which, in 1680, he passed to Christ Church, Oxford. In 1687, he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, master of University College. Disappointed in his expectation of succeeding to his father's rectory, in 1693, he sought a wider field of distinction, for ambition seems to have stimulated his efforts rather more than the love of souls, and in London his rhetorical powers soon won him reputation. He became a royal chaplain, minister of Bridewell, and lecturer of St Bride's. In 1698, a temporary sensation was created in the learned world by the appearance of the Hon. Charles Boyle's *Examination of Dr Bentley's Dissertations on the Epistles of Phalaris and the Fables of Æsop*. This clever, but shallow and malicious performance was in reality composed chiefly by A., who had been the young nobleman's tutor at Christ Church. In 1700 he distinguished himself in a controversy with Dr Wake and others regarding the powers and privileges of convocations. A.'s zealous and caustic defence of the ecclesiastical against the civil authority, procured him the thanks of the lower House of Convocation, and the degree of D.D. In 1704, he was promoted to the deanery of Carlisle, on which occasion he subjected himself to just obloquy by attempting to procure an alteration in the date of his predecessor's resignation, which happened to interpose a temporary obstacle to his appointment. In 1707 he was made a canon of Exeter; in 1709, preached at the Rolls Chapel; in 1710 he was chosen prolocutor to the lower House of Convocation, and in the same year he had the chief hand, according to the common belief, in drawing up the famous defence of Dr Sacheverell; in 1712, he became Dean of Christ Church, where, however, his turbulent and combative spirit had meanwhile involved him in so many controversies, that there was no peace until he was removed; in 1713, he was made Bishop of Rochester and Dean of Westminster. It is supposed, not unreasonably, that A. aspired to the primacy; but the death of Queen Anne extinguished his hopes in that direction. His known character and Jacobite leanings made him no favourite with George I. In 1715 he refused to sign the bishops' declaration of fidelity, and some of the most violent protests of the Peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restoration of the Stuarts, brought down upon him at length the charge of treason, and, in August 1722, he was committed to

arrangement, Attica and Bœotia
form a department or government in the kingdom of Greece. The surface of the country is broken into hills and narrow plains. The most considerable hills are—Oxea, 4636 feet; Elaté, 4629; Pentelicus, famous for its marble in ancient times, of a white brilliant appearance and perdurable character, 3884; and Hymettus, 3506. The largest plains extend in the neighbourhoods of Athens and Eleusis. As early as the time of Solon, A. was well cultivated, and produced wine and corn. Mount Hymettus was celebrated for its bees and honey, and metals were found in the range of Laurium. Figs, olives, and grapes are still cultivated. Goats and sheep find suitable pasturage; but the country does not now produce much grain. The population of A. and B. (1870) was 136,804.—See Leake on the *Demoi of A.*

A'TTICUS, TITUS POMPONIUS, one of the most noble and generous men in ancient Rome, was born in 109 B.C., or a few years before the birth of Cicero. His excellent education, during which he enjoyed the companionship of Torquatus, the younger Marius, and Cicero, developed, at an early age, a love of knowledge, which was increased during his stay in Athens, where he remained many years, glad to be separated from the political distractions of his native land. After 65 B.C., when he was induced by Sulla to return to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in political affairs. Yet he was by no means without influence on public matters, as he lived on terms of familiar intercourse with several leading statesmen, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious mercantile speculations. His mode of life was frugal. When he was informed that a disorder under which he was labouring was mortal, he voluntarily starved himself, and died in 32 B.C. Among his personal friends, Cicero held the first place. The *Annales*, written by A., were highly commended by his contemporaries. They were especially valuable on account of containing genealogical histories of the old Roman families. A. was one of those men (not uncommon either in ancient or modern times) in whom fine culture and a fortunate social position had highly developed the faculty of good taste. He had no creative genius, but was possessed of such delicate discernment that he could detect the flaw that would have been invisible to Cicero. Every author was anxious to secure his favourable opinion. None of his writings have been preserved. His biography is found in Cornelius Nepos, and in Cicero's *Epistles to A.*

A'TTILA (Ger. *Etzel*; Hungarian, *Ethele*, conjectured to have been originally titles of honour), king of the Huns, was the son of Mundzuk, a Hun of the royal blood, and in 434 A.D. succeeded his uncle Roas as chief of countless hordes scattered over the north of Asia and Europe. His brother Bleda, or Blödel, who shared with him the supreme authority over all the Huns, was put to death by A. in 444 or 445 A.D. The Huns regarded A. with superstitious reverence, and Christendom with superstitious dread, as the 'Scourge of God.' It was believed that he was armed with a supernatural sword, which belonged to the Scythian god of war, which must win dominion over the whole world. It is not known when the name 'Scourge of God' was first applied to A. He is said to have received it from a hermit in Gaul. The whole race of Huns was regarded in the same light. In an inscription at Aquileia, written a short time before the siege in 452, they are described as *imminentia peccatorum flagella* (the

threatening scourges of sinners). The Vandals, Ostrogoths, Gepidæ, and many of the Franks, fought under his banner, and in a short time his dominion extended over the people of Germany and Scythia —i. e., from the frontiers of Gaul to those of China. In 447, after his unsuccessful campaign in Persia and Armenia, he advanced through Illyria, and devastated all the countries between the Black Sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The Emperor Theodosius collected an army to oppose the inundation of the barbarians, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedon, and Greece were overrun; seventy flourishing cities were desolated, and Theodosius was compelled to cede a portion of territory south of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451, A. turned his course to the West, to invade Gaul, but was here boldly confronted by Aëtius, leader of the Romans, and Theodoric, king of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne —called anciently the Catalaunian Plain—waited to meet the enemy. The army of the West, under Aëtius and Theodoric, encountered the forces of the Huns near the site now occupied by the city of Chalons-sur-Marne. Both armies strove to obtain the hill of moderate height which rises near Mury, and commands the field of battle, and after a terrible contest, the ranks of the Romans and their allies, the Visigoths, were broken. A. now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command, and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the height into the plain was irresistible. On every side the Huns were routed, and A. with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the most sanguinary battle ever fought in Europe; for it is stated by contemporaries of A., that not less than 252,000 or 300,000 slain were left on the field. A., having retired within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pile, resolving to die in the flames rather than surrender; but by the advice of Aëtius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. In the following year, A. had recovered his strength, and made another incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, Apennines, and the lagoons of the Adriatic Sea, where they founded Venice. The Roman emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of Pope Leo I., who visited the dreaded barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans, and old chroniclers relate that the apostles Peter and Paul visited the camp of A., and changed his purpose. By 453, however, A. appears to have forgotten the visit of the two beatified apostles, for he made preparations for another invasion of Italy, but died of hæmorrhage on the night of his marriage with the beautiful Ildiko. His death spread consternation through the host of the Huns. His followers cut themselves with knives, shaved their heads, and prepared to celebrate the funeral rites of their king. It is said that his body was placed in three coffins—the first, of gold; the second, of silver; and the third, of iron; that the caparison of his horses, with his arms and ornaments, were buried with him; and that all the captives who were employed to make his grave were put to death, so that none might betray the resting-place of the king of the Huns.

Jornandes describes A. as having the Mongolian characteristics—low stature, a large head, with small, brilliant deep-seated eyes, and broad shoulders. There can be little doubt that circumstances conspired, in the case of A., to give a certain largeness to his barbaric conceptions, which made him a most formidable foe to the civilisation of Europe.

A'TTOCK, a town and fort of the Punjab, on the left or east bank of the Indus, lat. 33° 54′ N., long. 72° 20′ E. Pop. 2000. A. stands within the limits of the fort, which is itself a parallelogram of 300 yards by 400. The place was established by the Emperor Akbar in 1581, to defend the passage of the river. In modern warfare, however, it is no longer a position of strength, being commanded by the neighbouring heights. A tunnel under the Indus at A. is in course of construction.

The situation of A. is important, whether in a commercial or in a military view. It is at the head of the steam-boat navigation of the Indus, being 940 miles from its mouth; while about 2 miles above it, the Cabul River, the only considerable affluent of the Indus from the west, is practicable for vessels of 40 or 50 tons to a distance of 50 miles. The valley, again, of this last-mentioned stream, presenting, as it does, the best approach to the east and south from Central Asia, has been the route of nearly all but the maritime invaders of India from the days of Alexander the Great downwards. *Taxila*, where the Macedonians crossed the Indus, is supposed to have been the same as Attock.

ATTO'RNEY, in its general meaning, is one appointed by another to act for him in his absence, the authority for so acting being expressed by a deed called a Power of Attorney.

ATTO'RNEYS AND SOLI'CITORS are those legal practitioners who conduct litigation in courts of justice, preparing the cause for the barristers, or counsel, as they are called, whose duty and privilege it is to plead and argue on behalf of the contending parties, and who in open court have its exclusive audience. A. and S. also practise conveyancing, or the preparation of legal deeds and instruments, and they manage a great deal of other general business connected with the practice of the law, for which, as well as for the discharge of all their duties, they are mostly remunerated by a fixed and minute scale of charges. Theirs is, indeed, an extremely important, influential, and lucrative profession, and the well-employed attorney, and the 'family solicitor,' are expressions which readily suggest the idea of acute intelligence, along with high character and confidential trusts seldom abused.

They are called *A.*, as practitioners in the courts of common law, because the attorney is one who is put in the place, stead, or *turn* of another. Formerly, when prosecuting or defending, suitors were obliged to appear *personally* in court; but now, on principles of convenience, A. may represent, and can also prosecute or defend any action or suit in the absence of, the parties. They are called *S.* in the Courts of Chancery, according theoretically to the more gentle (but not less absolute) compulsion of equity. S. also is the name usually given to this profession when they transact family or other general business out of court, and in their own chambers. A. and S. are admitted by the superior courts, of which, therefore, they are officers, having many privileges as such, and they are, in consequence,

peculiarly subject to the censure and control of the judges.

The statutes relating to this branch of the legal profession being numerous and complicated, were amended and consolidated by the 6 and 7 Vict. c. 73, &c., and 33 and 34 Vict. c. 28. No person shall act as an attorney or solicitor in any court of civil or criminal jurisdiction, or in any court of law or equity in England or Wales, unless he shall have been admitted, enrolled, and be otherwise duly qualified according to the provisions of the act. And it has been decided that the person who acts as an attorney without being properly qualified, is liable to be indicted for a misdemeanour. There is an exception, however, to the rule of admission as stated, contained in a subsequent act, the 7 and 8 Vict. c. 101, s. 63, which provides that clerks or other officers to any board of guardians under the poor laws, may commence or defend proceedings before magistrates, in special or petty sessions, or out of sessions, without being qualified as attorneys. And by the 20 and 21 Vict. c. 30, facilities are afforded for the admission and enrolment in England of A. and S. of those colonial courts where the English system prevails.

To entitle a person to admission as an attorney and solicitor under 23 and 24 Vict. c. 127, and 6 and 7 Vict. c. 73, it is required, first, that he shall have served—having been duly bound by contract in writing so to do—with some practising attorney or solicitor in England or Wales, a clerkship of five years; or—if a barrister, advocate, W.S., or S.S.C., or graduate of Scotch or Irish university, or of Cambridge, Oxford, Dublin, Durham, or London—a clerkship of three years. In some cases, four years' service are allowed. He must now pass a preliminary examination in general knowledge, as well as occasional examinations in legal subjects during his articles. The judges now have large controlling and dispensing powers as to the articles, service, fitness, and capacity to act; and the judges (or Master of the Rolls, as the case may be), upon being satisfied by such examination, or by the certificates of examiners appointed by them, of the competency of any candidate for admission, shall administer to him such oath as specified in the act, viz., 'that he will truly and honestly demean himself in practice,' and also the oath of allegiance; and after such oaths, shall cause him to be admitted as an attorney of the said courts of law at Westminster, or as solicitor of the High Court of Chancery. It is moreover enacted, that there shall be a registrar of A. and S., whose duty it shall be to keep an alphabetical list or roll of all A. and S., and to issue certificates as to persons who have been duly admitted and enrolled; and the duties of this office are by the act committed to the 'Incorporated Law Society,' until some person shall be appointed in their room. Such a certificate from the registrar, of due admission and enrolment, must be produced to the proper authorities, by any person desirous of practising as an attorney or solicitor, before he can obtain the stamped certificate required by the Stamp Act, 33 and 34 Vict. c. 97, authorising him to practise for the ensuing year; and in order to obtain such registrar's certificate, a declaration in writing, signed by the attorney desirous of practising, or by his partner, or in some cases by his London agent, containing his name and address, the courts of which he is an admitted attorney or solicitor, and the date of his admission, must be delivered to the registrar. And if any attorney or solicitor shall practise in any of the courts aforesaid, without having obtained a stamped certificate for the current year, he shall be incapable of maintaining any action or suit to recover his fees, and be guilty of a contempt of court, and subject to fine.

The same statute also contains the following regulations, among others of less general information: That no attorney or solicitor shall have more than two clerks, bound by contract in writing, at one and the same time; nor any such clerk after he shall have left off business. That all persons admitted as A. of one of the superior courts of law at Westminster may, upon production of a certificate thereof, be admitted in any other court of law in England or Wales, upon signing the roll of the same; and that persons admitted as S. in the High Court of Chancery may in like manner obtain their admission in all other courts of equity, and in the Court of Bankruptcy. That no attorney or solicitor, who shall be a prisoner in any jail or prison, may commence or defend any action, suit, or proceeding in law, equity, or bankruptcy; or maintain any action for fees for business done during such his confinement; and that no practising attorney or solicitor shall be a justice of the peace in England or Wales, except in counties or towns corporate having justices by charter or otherwise. And that no attorney or solicitor shall commence an action or suit for his fees or charges in respect of any business whatever, until after the expiration of one calendar month after a bill of his costs and charges, signed by such attorney or solicitor, shall have been delivered to the party to be charged; and such party may, on a proper application, obtain an order for referring such bill to be taxed; and for staying all proceedings to recover the amount thereof in the meantime. An order may also be obtained directing an attorney or solicitor to deliver his bill (when he has not done so); and also an order for his delivering up, upon payment of what is due, all deeds, papers, and documents in his possession or power touching the business in such bill comprised. Attorneys may now, under the act 33 and 34 Vict. c. 28, enter into special agreements with their clients as to their remuneration. But this agreement, as regards suits and actions, must be deemed by the taxing officer or a court to be reasonable and fair. They may now also make it one of the stipulations that they shall not be liable for negligence. But they are still prohibited from stipulating for payment only in the event of success.

The position of A. and S. in Ireland, like the system of law and practice in that country generally, is so like that of the same profession in England, that it is unnecessary here to give any details respecting them.

The corresponding professional class in Scotland was, up to the year 1874, composed of several distinct bodies called Writers to the Signet, and Solicitors before the Supreme Courts, who had the exclusive right to practise before the Court of Session; and of procurators, whose practice was confined to their own sheriff courts. The unsatisfactory relations existing between these bodies led to a revision of the law, which was embodied in the Law Agents Act of 1873 (36 and 37 Vict. c. 63). No person was thereafter entitled to be admitted a law agent in Scotland except under the new regulations, and all enrolled law agents were to have the right, on payment of proper stamp-duties, to practise in any court of law in Scotland. Applicants for future admission are to be apprenticed for five years with a practising law agent; but advocates, English barristers, and attorneys are to serve only three years, as also graduates of a university. The Court of Session appoints examiners. Any enrolled law agent may be admitted to practise in the Court of Session. Law agents acting for the same client may lawfully agree to share profits and qualify their mutual liability. Existing societies of procurators may admit members as they see fit, but any agent admitted under the act need not become a member of such society.

ATTORNEY-GENERAL, the title by which, in England and Ireland, the first ministerial law officer of the crown is known. The A. is appointed by letters patent. His office corresponds in many respects to that of the Queen's Advocate in the Court of Admiralty and of the Lord Advocate in Scotland (q. v.), though the powers of the latter are more extensive and less clearly defined. Originally, the A. was simply the king's attorney, and stood to the sovereign in the same relation that any other attorney does to his employer. The term 'general' was afterwards conferred to distinguish him from attorneys appointed to represent the interests of the crown in particular courts, such as the Court of Wards; or from the master of the crown office, who is called the 'Coroner and Attorney for the Queen.' The early history of this office is involved in obscurity. Though there can be no doubt that the crown must always have been represented by an attorney in the courts of justice, there is no trace of the existence of such an officer as the A., in the modern sense, till some centuries after the Conquest. Up to a period comparatively recent, the king's serjeant was the chief executive officer of the crown in criminal proceedings, and this circumstance gave rise to various questions of difficulty as to the right to precedency of these officers respectively. These questions were set at rest in 1811, by a special warrant by the then Prince Regent, afterwards King George IV., by which it was declared that both the attorney and solicitor general should have place and audience before all other members of the English bar. A similar question arose in a Scotch appeal in the House of Lords in 1835, between the A. and Lord Advocate, which was also decided in favour of the former. The following may be enumerated as the principal duties of the A.: 1st, To exhibit informations and conduct prosecutions for crimes which have a tendency to disturb the peace of the state or endanger the constitution (see PLEAS OF THE CROWN); 2d, To advise the government on legal questions; 3d, To conduct prosecutions and suits relating to the revenue; 4th, To file informations in the Exchequer for personal wrongs committed on any of the possessions of the crown; 5th, To protect charitable endowments in the sovereign's name, as *parens patriæ*, and, generally, to appear in all legal proceedings in which the interests of the crown are at stake. The attorney and solicitor general are two of the Commissioners of Patents (q. v.) *ex officio*. The powers of the solicitor-general are co-ordinate with those of the A., and in the absence of the latter, or during a vacancy, the former may perform his functions in all their extent. Both usually have seats in the House of Commons, and their tenure of office concurs with that of the government of which they are members. They were formerly paid by fees, but now by fixed salary.

The duchies of Lancaster and Cornwall, and the county palatine of Durham, have separate attorney-generals.

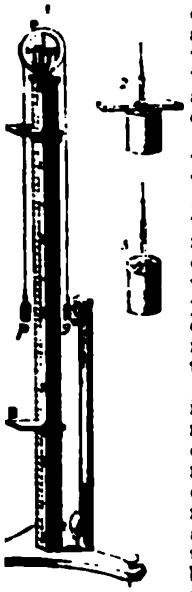
ATTRA'CTION is the general name for the force or forces by which all bodies, from the minutest particles to the largest planets, suns, and systems of suns, tend to approach, or are *drawn towards* (*ad*, to; *tractus*, drawn) one another, and when in contact, are held together. The term is generic, embracing a vast variety of facts, which are subdivided under five heads or species of A. These are—1. Gravitation; 2. Cohesion; 3. Adhesion; 4. Chemical Affinity; 5. The attractions of Electricity, Magnetism, &c. See GRAVITATION, COHESION, &c. Attempts have been made to deduce all these phenomena from one principle of A., modified by an opposing force of repulsion, but as yet without success. Still less can they be explained by assuming only *one* force—A. alone, or repulsion alone—for this, too, has been attempted. The idea of an attractive force acting as the bond of the universe was first introduced as a scientific hypothesis by Newton, and was violently combated by Leibnitz and others.

A'TTRIBUTE, in the Fine Arts, is a species of symbol, consisting of a secondary figure or object accompanying the principal figure—as the trident of Neptune, or the owl of Minerva. Attributes serve to mark the character meant, and add to the significance of the representation. The necessity of using them lies in the limited means of expression possessed by the formative arts. Attributes may be either essential or conventional. Essential attributes have some real relation or resemblance to the object or idea to be expressed; and are often such as could stand alone as symbols—as the bee, representing diligence. Attributes, in the strictest sense, and as distinguished from symbols, are such as are significant only in connection with a figure, to which they in a manner belong; e. g., the wings of genii, the finger on the mouth of Harpocrates. The last is an example of an accidental or conventional A., of which kind are also the *anchor*, to express hope; the *cross*, faith. Common attributes in Christian art are—the harp for King David, and writing materials for the evangelists, especially St John.

A'TTRIBUTE, in Logic, is used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus, wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere; in the same way, whiteness is called an A. of snow.

A'TWOOD'S MACHI'NE, an instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity. It was invented by George Atwood or Attwood, a mathematician of some eminence, who was born in 1745, educated at Cambridge, became fellow and tutor of Trinity College in that university, published a few treatises on Mechanics and Engineering, and died in 1807. It is found that a body falling freely, passes through 16 feet in the first second, 64 feet in the first two seconds, 144 feet in the first three seconds, and so on. Now, as these spaces are so large, we should require a machine of impracticable size to illustrate the relations just mentioned. The object of A. M. is to reduce the scale on which gravity acts without in any way altering its essential features as an accelerating force. The machine consists essentially of a pulley, P (see fig. 1), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *q*, at its extremities. The pulley rests on a square wooden pillar, graduated on one side in feet and inches, which can be placed in a vertical position by the levelling-screws of the sole on which it stands. Two stages, A and B, slide along the pillar, and can be fixed at any part of it by means of fixing-screws. One of these stages, A, has a circular hole cut into it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken, and intercepts the passage of the weight. A series of smaller weights, partly bar-shaped, partly circular, may be placed on the cylinders in the way represented in figs. 2 and 3. A pendulum usually accompanies the machine, to beat seconds of time. The weight of the cylinders, *p* and *q*, being equal, they have no tendency to rise or fall, but are reduced, as it were, to masses without weight. When a bar is placed on *p*, the motion that ensues is due only to the action of

upon it, so that the motion of the whole ...e considerably slower than that of the bar falling freely. Suppose, for instance, that *p* and *g* are each 7¼ ounces in weight, and that the bar is 1 ounce, the force acting on the system—leaving the friction and inertia of the pulley out of account—would be 1/8 of gravity, or the whole would move only 1 foot in the first second, instead of 16. If the bar be left free to fall, its weight or moving force would bring its own mass through 16 feet the first second; but when placed on *p*, this force is exerted not only on the mass of the bar, but on that of *p* and *g*, which is 15 times greater, so that it has altogether 16 times more matter in the second case to move than in the first, and must, in consequence, move it 16 times more slowly. By a proper adjustment of weights, the rate of motion may be made as small as we please, or we can reduce the accelerating force to any fraction of



...ood's Machine.

Suppose the weights to be so adjusted ...ser the moving force of the bar or circular ... whole moves through 1 inch in the first ...s may institute the following simple

Experiment 1.—Place the bar on *p*, ...wo in such a position that the lower ... bar shall be horizontally in the same ... point of the scale, and fix the stage A When allowed to descend, the bar will ...*f* the weight, *p*, during one second and ..., when it will be arrested by the stage A, ...h *p* and *g* will continue to move from the they have acquired in passing through ... ...ch. Their velocity will now be found to uniform, being 2 inches per second, illus... the principle that a falling body acquires, at ... of the first second, a velocity per second ... twice the space it has fallen through. 2.—... te, instead of the bar, the circular ... the bottom of *p* in a line with the 0 ...at the stage B at 64 inches. Since the ...companies *p* throughout its fall, we have experiment the same conditions as in the fall of a body. When let off, the bottom ... cylinder, *p*, reaches 1 inch in 1 second, 4 ... 2 seconds, 9 inches in 3 seconds, 16 inches ..., 25 inches in 5 seconds, 49 inches in 7 ..., and 64 inches and the stage in 8 seconds—...g that the spaces described are as the squares times. *Exp.* 3. If the bar be placed as in ..., and the stage A be fixed at 4 inches, the bar ...ccompany the weight, *p*, during two seconds, ...e velocity acquired in that time by *p* and *g* ... 4 inches per second, or twice what it was ... In the same manner, if the stage A be ...at 9, 16, 25, &c. inches, the velocities acquired through these spaces would be respectively &c. inches—two inches of velocity being ... in each second of the fall. From this it ... the force under which bodies fall is ... accelerating force—that is, adds equal increments of velocity in equal times. By means of the bar and the stage A, we are thus enabled to remove the accelerating force from the falling body at any point of its fall, and then question it, as it were, as to the velocity it has acquired.

AUBE, the name of a river and a department of France. The river A., a tributary of the Seine, rises near Pralay, on the plateau of Langres; flows in a north-west course by Rouvres, La Ferté, Bar, and Arcis; and falls into the Seine at Pont-sur-Seine, after a course of 90 miles.—The department of A., which occupies the southern part of the old province of Champagne, and a small portion of Burgundy, is bounded on the N. by the Marne; on the E. by the Haute-Marne; on the S.W. by the Yonne; and on the N.W. by the Seine-et-Marne. The eastern part belongs to the basin of the A.; the western, to the basin of the Seine. Area, 2351 square miles. Pop. 255,687. The climate is mild, moist, and changeable; but on the whole healthy. A great portion of the area is arable land. The north-east is chiefly applied to pasturage; but the south-east is far more fertile, rich in meadow-land and forest, and producing grain, hemp, rape, hay, timber, and wine. In minerals, the department possesses little besides limestone, marl, and potters' clay. The chief manufactures are woollen cloth, cotton and linen goods, ribbons and stockings, leather, parchment, &c. The sausages and bacon of A. have long been famous. *Troyes* is the capital of the department.

AUBENAS, a town in France, in the department of Ardèche. It is picturesquely situated on the right bank of the Ardèche, 14 miles south-west from Privas, in the middle of the volcanic region of Vivarais. It looks well from a distance; but the streets, with the exception of one traversed by the diligence, are narrow and crooked, the squares small, and the houses very irregularly built. An old and rapidly decaying wall, flanked with towers, girds the town, which contains an ancient castle. A. is the principal mart for the sale of chestnuts and silk in the department. Several important fairs are also held here. It possesses in addition manufactures of silk, paper, cotton, coarse cloths, leather, &c., the machinery of the mills being driven by water. Pop. 4647.

AUBER, Daniel François Esprit, a composer of operas, was born at Caen in Normandy, January 29, 1784. His father was a printseller in Paris, and being desirous that his son should devote himself to business, he sent him to London to acquire a knowledge of the trade. But his irresistible passion for music obtained the upper-hand, and after a short stay, he returned to Paris. Among his earliest compositions may be noticed—the *concertos* for the violoncello, ascribed to Lamare the violoncellist; the concerto for the violin, played by Mazas with great applause at the Conservatory of Music, Paris; and the comic opera, *Julie*, with a modest accompaniment for two violins, two altos, and a bass. These works were very successful; but A., aspiring to greater things, now devoted himself to a deeper study of music under Cherubini, and wrote a mass for four voices. His next work, the opera *Le Séjour Militaire* (1813), was so coldly received that A. grew disheartened, and resolved to abandon the idea of reaching eminence as a musical composer. However, the death of his father compelled him to be dependent on his own resources; and in 1819 appeared *Le Testament et les Billets-doux*, which was also unsuccessful; but in *La Bergère Châtelaine* he laid the foundation of his subsequent fame. In all these early essays, as well as in the opera of *Emma* (1821), he displayed an original style; but afterwards he became an imitator of Rossini,

and disfigured his melodies with false decorations and strivings for effect. All his later works, excepting *La Muette de Portici* (Masaniello), produced in 1828, are written with an assumed mannerism, but in a light and flowing style, with many piquant melodies which have made the tour of Europe. The operas *Leicester* (1822), *La Neige* (1823), *Le Concert à la Cour*, and *Léocadie* (1824), *Le Macon* (1825), *Fiorella* (1826), *La Fiancée* (1829), *Fra Diavolo* (1830), were followed by a series of lighter works: *L'Elixir d'Amour*, *Le Dieu et la Bajadère*, *Les Faux Monnayeurs*, &c.; the later operas, *Gustave ou le Bal Masqué*, *Le Lac des Fées*, *Le Cheval de Bronze*, *Les Diamants de la Couronne*, *La Part du Diable*, *La Sirène*, and *Haydée*, exhibiting the same popular qualities as their predecessors; but their interest is evanescent, as they are deficient in depth of thought and feeling. His later works are *Jenny Bell* (1855), and *Manon Lescaut* (1856). In 1842, A. was appointed director of the Conservatory of Music, Paris. He died May 14, 1871.

AUBIGNE, MERLE D'. See MERLE D'AUBIGNÉ.

AUBIGNÉ, THEODORE AGRIPPA D', a famous French scholar, was born on 8th February 1550, near Pons in Saintonge. At an early period, he exhibited a remarkable talent for the acquisition of languages. Although come of a noble family, he inherited no wealth from his father, and consequently chose the military profession. In 1567, he distinguished himself by his services to the Protestant cause, and was subsequently rewarded by Henry IV., who made him vice-admiral of Guienne and Bretagne. His severe and inflexible character frequently embroiled him with the court; and after the death of Henry, he betook himself to Geneva, where he spent the remainder of his life in literary studies. He died April 29, 1630.

His best known work is his *Histoire Universelle*, 1550—1601 (Amsterdam, 1616—1620), which had the honour of being burned in France by the common hangman, as also his *Histoire Secrète, écrite par lui-même* (1721). A. was possessed of a spirit of biting satire, as is proved by his *Confession Catholique du Sieur de Sancy*, and his *Aventures du Baron de Fœneste*.

AUBRY DE MONTDIDIER, a French knight who lived in the times of Charles V., and, as tradition says, was assassinated in the forest of Bondy by Richard de Macaire in 1371. The latter became suspected of the crime on account of the dog belonging to the deceased Aubry invariably displaying towards him the most unappeasable enmity. Macaire was therefore required by the king to fight with the animal in a judicial combat, which was fatal to the murderer. This tale was afterwards, under the titles of *Aubry's Dog*, *The Wood of Bondy*, *The Dog of Montargis*, frequently acted, the 'dog' always gaining the greatest share of applause! After being performed with success at Vienna and Berlin, it was appointed to be played at the Weimar Theatre, of which Goethe was the manager; but the poet resigned his office before the dog made his *début*.

AUBURN, the name of 23 places in the United States. Of these, the most important is in the state of New York, on the railway between Albany and Buffalo. It is in lat. 42° 53' N., and long. 76° 40' W. Pop. (1870) 17,225. The outlet of Owasco Lake, which is two or three miles to the north, flows through the town, furnishing a water-power which is employed in mills of various kinds, and in manufactures of wool, cotton, carpets, iron, and paper. A. abounds in seminaries of education, but is perhaps most widely known for its state prison. The building itself is a large structure of stone; while the wall that encloses it is 30 feet high, and 500 long, on each of its four sides. The number of convicts sometimes exceeds 800; and their labour is said to be generally equal to the expenses of the establishment.

AUBUSSON, PIERRE D', grand master of the order of St John of Jerusalem, was born in 1423 of an ancient and noble French family. His early history is imperfectly known, but he is said to have borne arms, when very young, against the Turks in the wars in Hungary, and to have distinguished himself by the mingled zeal and valour he displayed. Here he acquired that intense antipathy to the 'Infidels' which subsequently animated his whole public career, and gave a peculiar bias to his ambition. Having returned to France, he accompanied the dauphin in his expedition against the Swiss, and was instrumental in securing their defeat at the battle of St Jacob near Basle. His mind, however, constantly reverted to the ominous encroachments in the East of the dreaded Mussulman, and at last he resolved to betake himself to Rhodes, where he enrolled himself among the brotherhood of Christian knights. Now, his history emerges into clear light, and assumes a very considerable importance. He swept the Levant, and chastised the pirates who prowled perpetually among the Greek isles, obtaining the approbation and regard of the grand master. In 1458, by his ardour and address he succeeded in forming a kind of Christian league between the French monarch and Ladislaus, king of Hungary, against Mohammed II. This was the great aim of A.'s life, the 'idea' which continually possessed him—viz., the necessity of a vast organisation of all Christendom to overthrow the power of the Turks. Step by step, through long years, he won his way to supreme power in his order. In 1476, he was elected Grand Master. It was a critical period for the civilisation and religion of Europe. Constantinople had recently been taken and the Byzantine empire destroyed by Mohammed II. Every day the conqueror marched further west. Thrace, Macedonia, Central Greece, Servia, Wallachia, Bosnia, Negropont, Lesbos, and the islands of the Adriatic, had been successively conquered by him. Proud of his rapid glories, and sustained by an immense prestige, the sultan threatened to dictate terms from Rome to the entire West. Rhodes, however, stood in his way, the sentinel isle of Christianity, on the great maritime route between Asia and Europe. Mohammed saw that the battle between the two faiths must begin here; and in May 1480, a Turkish army of 100,000 men, commanded by a Greek renegade, Palæologus, landed in the island, and commenced to besiege the town. Two desperate assaults were made. The Turks, however, were compelled to desist, and sailed away, leaving 9000 dead. Mohammed was enraged, and planned a second expedition, which was interrupted by his death at Nicomedeia in Asia Minor, May 1481. After this, A. took a leading part in the religious diplomacy of the papal court, and received from the pontiff many honours and privileges. Meanwhile, he exerted himself to improve and strengthen the internal organisation of the brotherhood, enriching the diplomatic code of his order with several wise statutes and regulations relative to the election of dignitaries, the finances, &c., and exciting great admiration throughout Christendom. In 1501, he was appointed generalissimo of the forces of the German emperor, the French king, and the pope, against the Turks; and in spite of his great age, he enthusiastically entered on his duties, and sailed to attack Mitylene; but the expedition failed on account of the discordant aims which the various belligerents had in view. Broken by disappointment and vexation, the grand master returned, and died at Rhodes in July 1503, at the age of 80.

AUCH, the capital of the department of Gers, in the south of France, situated on the river Gers, 42 miles west of Toulouse, lat. 43° 38′ N., long. 0° 35′ E. Pop. 9414. It is the seat of an archbishop, and possesses a museum of natural science, together with an old and beautiful cathedral, the painted windows of which are greatly admired. Its chief articles of trade are woollen and cotton stuffs, fruits, wine, and brandy.

In ancient times, it was called *Elimberis;* and at a somewhat later period took its name from the Ausci, whose chief town it was. In the 8th c., it became the capital of Gascony, and later, of the county of Armagnac.

AUCHE'NIA (from the Gr. *auchen*, the neck), a genus of ruminating quadrupeds, of which the Llama (q. v.) and the Alpaca (q. v.) are the best known. The genus is exclusively South American; indeed, the species occur only on the lofty ranges of the Andes. They are nearly allied to the camels, and may be regarded as their representatives in the zoology of America. They form, along with them, the family *Camelidæ* (see CAMEL), and were included by Linnæus in the genus *Camelus*. They agree with the camels in certain important anatomical characters, particularly in the structure of the stomach; and also resemble them very much in general form, in the long neck, small head, prolonged and movable upper lip, and small apertures of the nostrils. They differ from them partly in dentition, and partly in the more cloven feet and movable toes. The nails, also, are stronger and curved, and each toe is supported behind by a pad or cushion of its own; by all which the feet are admirably adapted for the rocky heights which the animals inhabit. The genus A. is by some naturalists called *Llama*.

AUCHTERARDER, a village in the south-east of Perthshire, on the west side of the Scottish Central Railway. Pop. (1871) 3795, chiefly employed in cotton-weaving. The popular opposition to the presentee to the church of A. originated (1839) the struggle which ended in the secession from the Church of Scotland and the formation of the Free Church in 1843.

AUCKLAND, BISHOP, a small town in the middle of the county of Durham. Pop. (1871) 8736. It stands on an eminence, 140 feet above the plain of the Wear. A. contains the abbey-like palace of the Bishop of Durham.

AUCKLAND, LORD, WILLIAM EDEN, an able statesman and diplomatist, third son of Sir Robert Eden, Bart., of West Auckland, Durham, born in 1744, educated at Eton and Oxford, and called to the bar in 1768. In 1772, he became Under-secretary of State, and one of the directors of Greenwich Hospital; was chosen M.P. for Woodstock; and in March 1776 appointed a lord of trade. In 1778, he was nominated, with the Earl of Carlisle and Governor Johnstone, a commissioner to treat with the insurgent colonists of North America, but without success. When the former was, in December 1780, named Lord Lieutenant of Ireland, he accompanied him as chief secretary, and remained there till April 1782. Accredited in 1785 minister plenipotentiary to the court of France, he concluded a commercial treaty with that country in September 1786; and in the following August signed a convention for preventing disputes between the subjects of the two crowns in the East Indies. In 1788, he went as ambassador to Spain; and on his return in October 1789, he was created an Irish peer as Baron A. In 1790 he was ambassador to Holland, and in May 1793 was created a British baron. From 1798 to 1801, he was joint Postmaster-general. He died suddenly, May 28, 1814. A. was the author of the *Principles of the Penal Law* (1771, 8vo); Four Letters, addressed to the Earl of Carlisle, on temporary political subjects (1779); *Remarks on the Apparent Circumstances of the War* (1795); *Speech on the Income-tax* (1799); *Speech in Support of the Union with Ireland* (1800); and other pamphlets.

AUCKLAND, EARL OF, GEORGE EDEN, governor-general of India, son of William Eden, Lord Auckland, born August 25, 1784, succeeded his father in 1814 as Lord A.; and in November 1833 joined Earl Grey's administration. In July following, in Viscount Melbourne's first ministry, he became First Lord of the Admiralty. He vacated that office in November of the same year, but was appointed to it again in 1846. In 1835 he went out to India as governor-general. He returned to England in 1841, and died unmarried, January 1, 1849.

AUCKLAND, the most northern of the provinces of New Zealand, includes fully a half of North Island, and is about 400 miles long by 200 wide, at its greatest breadth. A. has a coast-line of nearly 1200 miles; and is, in addition, remarkable for its rivers, which serve as carriage-ways for the produce of the interior. Pop. (1871) 62,335. There are three almost natural divisions of this province: North Peninsula, East Coast, and the Waikato Country—the latter two being mainly in the hands of the natives. Gold, copper, tin, iron, coal, and other minerals exist in A. The supply of an excellent household coal is plentiful; and springs of kerosene oil, tested to be good, have been found, but not yet worked to profit. The export of wool is large, and on the increase. The principal agricultural products are wheat, oats, barley, hay, and potatoes.

AUCKLAND, the largest city of New Zealand, capital of the above-named province, in lat. 36° 50′ S., and long. 174° 50′ E., was, till some years ago, capital of New Zealand, when the seat of government was transferred to Wellington, the chief city of the province of the same name. A. is distant from Sydney 12,036 miles; from Melbourne, 1650; and keeps up steam communication with these two cities. Picturesquely situated, its position for commerce is also excellent, as in addition to its harbour of Waitemata, it possesses also a western harbour, the Manakan, six miles distant. A. contains a well laid out botanical garden, and shews numerous public buildings, government house, barracks, &c. It supports three daily papers. A. was founded in 1840. Population (1871) 12,937. The temperature appears to be singularly equable. The mean of the coldest month is 51° F., and that of the warmest 68°. The annual rainfall is 45½ inches; and the days of rainfall average 100.

AUCKLAND ISLANDS, a group of islands to the south of New Zealand, being about the 51st parallel S., and the 167th meridian E. The largest of them measures 30 miles by 15. It has two good harbours, and is covered with the richest vegetation. The A. I. are valuable chiefly as a whaling station, being at the confluence, as it were, of the Pacific and Southern Oceans.

AUCTION (Lat. *auctio*). The character of this convenient mode of offering property for sale is correctly indicated by the name. The Latin word *auctio* means 'an increasing or enhancement,' and an A. is an arrangement for increasing the price by exciting competition amongst purchasers. What is called a *Dutch Auction*, in which the usual mode of proceeding is reversed, the property being offered at a higher price than the seller is willing to accept, and gradually lowered till a purchaser is found, is thus no A. at all in the original and proper sense of the term. The A. is of Roman origin, and is said to have been first introduced for the purpose

of disposing of spoils taken in war. Such sales were said to take place *sub hastâ* (under the spear), from the custom of sticking a spear into the ground, probably to attract purchasers to the spot. 'Conditions of Sale,' or 'Articles of Roup,' as they are called in Scotland, constitute the terms on which the seller offers his property, and form an integral part of the contract between seller and purchaser. The contract is completed by the offer or bidding on the part of the purchaser, and the acceptance by the seller or his representative, which is formally declared by the fall of the auctioneer's or salesman's hammer, the running of a sand-glass, the burning of an inch of candle (hence the term 'sale by the candle'), or any other means which may have been specified in the conditions of sale. These conditions or articles ought further to narrate honestly and fully the character of the object or the nature of the right to be transferred, to regulate the manner of bidding, prescribe the order in which offerers are to be preferred, and to name a person who shall be empowered to determine disputes between bidders, and in cases of doubt to declare which is the purchaser. Before the sale commences, these conditions, which are executed on stamped paper, are read over, or otherwise intimated to intending purchasers. The conditions, thus published, cannot be controlled by any verbal declaration by the auctioneer. The implied conditions, which, in addition to those thus expressed, are binding on the seller and purchaser in all auctions, are: 1. That the seller shall not attempt to raise the price by means of fictitious offers, but shall fairly expose his goods to the competition of purchasers; and 2. That the purchasers shall not combine to suppress competition. Much doubt has arisen as to the lawfulness of biddings for the exposer. The exposer may set a price below which the thing is not to be sold, which is best and most openly done by fixing an upset price, or he may expressly reserve to himself a power to offer. 'But if the sale is declared to be without reserve, or at the pleasure of the company, the plain meaning and effect of this, even in England, is held to be to bar all biddings in behalf of the seller.' 'In Scotland, the law condemns absolutely such interference.' 'It has been said, that if there be no upset price, and no agreement to sell at the pleasure of the company, the owner may bid, but that is not law, or is at least too broadly laid down.' Bell's *Commentaries*, i. 97, edit. 1858. The A. duties were repealed by 8 and 9 Vict. c. 15.

AUCTIONEER, the person who conducts an auction (q. v.). The A. is in a certain sense the agent both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated. The A. may also, and frequently does, act as agent for absent purchasers, or for persons who have instructed him to make biddings for them during the sale. In both cases, however, the purchaser must be *bonâ fide*, otherwise the A. would himself become a 'puffer.' As to the circumstances in which he may bid for the seller, see AUCTION. Where the A. declines or omits to disclose the seller's name, he undertakes his responsibilities to the purchasers. To the seller, again, he is responsible for ordinary skill, assiduity, and prudence. Every A. pays an annual duty of £10 to government for his licence, which must be renewed on the 5th July; though there are certain judicial sales which may be conducted by bailiffs without licence (see 19 Geo. III. c. 56, s. 3, and later Stamp Acts).

AU'CUBA, a genus of plants of the natural order *Cornaceæ* (q. v.), of which the only known species is *A. Japonica*, an evergreen shrub resembling a laurel, but with dichotomous or verticillate yellow branches, and, as seen in Europe, always with pale green leaves curiously mottled with yellow. It is dioecious, produces its small purple flowers in summer, and ripens its fruit, a small red drupe, in March. It is a native of China and Japan, and was originally introduced into Britain as a stove-plant, but is found to be at least as hardy as the common laurel, and is now a very common ornamental shrub, especially in the suburbs of large towns, a sort of situation for which it is particularly adapted, as it is very little liable to suffer injury from smoke. It is often called the Variegated Laurel. The mottled appearance of the leaf is said, however, not to belong to the plant in its ordinary natural state; but only this variety has yet been brought to Europe, and of it only the female plant.

AUDÆ'US, AUDI'US (or, according to his native Syriac name, *Udo*), the founder of a religious sect in Mesopotamia, flourished during the 4th c. He commenced by accusing the regular clergy of worldliness, impure morals, &c., and is said to have opposed to their manner of life a strict asceticism, until his conduct seemed dangerous to the welfare of the church, when he was excommunicated. His disciples, who were pretty numerous, now clung more closely to him, and he was elected their bishop. In 338 A. D., he was banished to Scythia, where he instituted a kind of rival church, and where he died about 370 A. D. Our knowledge both of his character and opinions is derived solely from inimical authorities, such as Augustine, Athanasius, &c., and is therefore to be accepted with caution. But his labours amongst the fierce barbarians in the north are acknowledged to have been beneficial, and one writer, Epiphanius, states that he ought to be considered *schismatical*, but not *heretical*. But if the leading feature of his system was, as is alleged, a decided tendency to anthropomorphism, we cannot see—according to the principles upon which the church usually proceeded—why he should not have been so called. He is said to have held that the language of the Old Testament justifies the belief that God has a sensible form—a doctrine deemed heretical in all ages of the church's history. This particular tenet took firm hold on many minds, and in the subsequent century, was widely spread through the monasteries of Egypt.

AUDE (*Atax*), a river in the south of France, rises in the east Pyrenees, not far from Mont Louis; flows for some time parallel to the canal of Languedoc; and falls into the Mediterranean 6 miles east-north-east of Narbonne, after a course of more than 120 miles.

AUDE, a maritime department in the south of France. It comprises some old 'counties' which formerly constituted a portion of the province of Languedoc. Pop. (1872) 285,297. Area, 2438 sq. m. The southern part of A. is mountainous, but the greater portion of it belongs to the valley of the lower A. and the canal of Languedoc. Its northern boundary is formed by the Black Mountains, the most southerly offsets of the Cevennes. The coast is flat, with no bays or roadsteads, but several lagunes. The climate is warm, but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. A. is rich in iron and coal, and mineral springs. The woollen and silk manufactures are of considerable value. There is likewise a considerable export of corn, honey, &c. The chief town is Carcassone.

, Jean Baptiste, a distinguished ——ist, was born in 1759 at Rochefort; arts of design and painting at Paris; and ..le attained a degree of eminence as a ... er. Indulging a predilection for the ... history, he was much employed by ...inting the more rare and beautiful ... collections. In 1800, after having England and Holland for the purpose of ketches, he published at Paris, on his own a splendid volume, which raised him at once ity, both as a painter and author. This ... *Histoire Naturelle des Singes, des Makis, Idopithèques* (Natural History of Monkeys, and Flying Lemurs), was a large folio, with d plates, remarkable alike for their truth ... His method of colour-printing in oil, ... n novel but now common, was to dis... colours on one plate instead of using a plate for each colour. His use of gold and ... the illustrations and letterpress was then ...w as it is attractive. In his *Histoire des ...des Oiseaux-mouches, des Jacamars, et des ...s* (Natural History of Humming-birds, ... and Promeropses), he succeeded by the ...cess in giving to his plates even a greater ... and finish. He died in 1800.

The ... of the Ordnance, of the Army and Navy, ... and Revenue, are now subjected to exami- ...the audit-office. By 2 Will. IV. c. 99, the ...d functions of the Commissioners of Public ... in Ireland were transferred to the Commis- ...r Great Britain. The present establish- ...he audit-office consists of a chairman, five ...ers, a secretary, and a large number of ... and examiners. The patronage is in the ...the Treasury. —Auditor of the Court of ... Scotland, is an officer whose duties con- ...ring the costs of suits in which expenses ...due, a remit being made to him for that ...ather by a division of the court or a Lord ... The auditor returns a report to the judge ...king the remit, by whom decree is pro- ...s the amount of the taxed account. Objec- ...he auditor's report may be stated to the ...ourt. The nomination of the auditor is in ..., the office being held *ad vitam aut culpam*. In the inferior courts an officer with corresponding powers is usually appointed by the court in which he officiates. The office of auditor of the Court of Session corresponds in many respects to that of the taxing-masters in the Court of Chancery. In Germany the name auditor is applied to junior legal functionaries.

AUDITORY NERVE. By anatomists, the A. N. is associated with the facial, and is the seventh in order of origin from the brain, counting from before backwards. The seventh pair consists of the portio dura or facial, the portio mollis or auditory, and a small intermediate portion. The portio mollis apparently commences by some white streaks in the floor of the fourth ventricle; it then runs forward to the back of the petrous portion of the temporal bone, and enters the internal auditory meatus. The facial then leaves it to pass along the canal called the Aqueductus Fallopii, and the auditory divides into two portions, which diverge—the smaller one posterior for the semicircular canals and the vestibule, the other for the cochlea. Those entering the semicircular canals divide into five branches, forming at last a nervous expansion somewhat analogous to the retina. Figs. 1 and 2 represent the A. N. (1) dividing into its two portions, the lesser branch supplying the semicircular canals (2), the larger branch supplying the cochlea (3). Fig. 1 represents the semicircular canals of the left side, with their bony rings round the membranous labyrinth. In this figure, the cochlea is cut in half longitudinally from base to apex, shewing a section of the spiral canal, with the nerve proceeding up through its

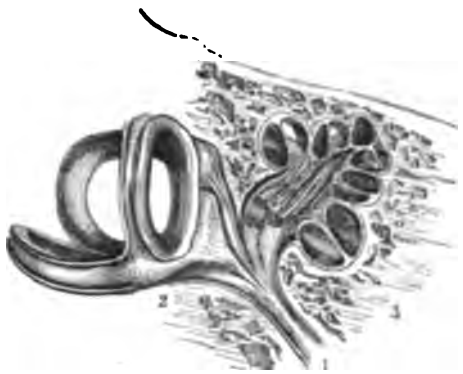


Fig. 1.—Left Auditory Nerve.

axis. Fig. 2 represents the membranous labyrinth (2), with the bony framework cut away, and with the cochlea opened so as to shew the manner in which the nerve spreads out in the spiral lamina.

Several theories have been held at different periods with regard to the manner in which the nerves terminate in the cochlea, and how sound is transmitted from the latter to the brain. The latest, and that which is at present entertained by most physiologists, is that of M. Schultze. It has been shewn by actual experiment, that when a nerve in connection with a muscle is acted upon by a succession of very rapid strokes from the little hammer of a tetanomotor, and when the strokes have arrived at a certain number in the second, a stimulus is sent along the nerve exciting the muscle to action. It is in the same way that M. Schultze supposes the impression of sound to be propagated to the nerves of the cochlea, by means of a series of little tetanomotors called the teeth of Corti, who discovered them. They are situated in the spiral lamina, which separates the spiral canal in the interior of the cochlea

into an upper and a lower half or scala. The spiral lamina consists of an osseous septum, next to the central axis of the cochlea, and of a membranous

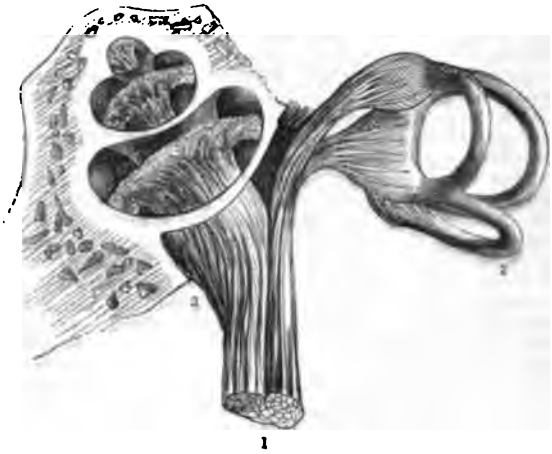

Fig. 2.—Right Auditory Nerve.

layer, which prolongs the osseous septum to the outer wall of the cochlea, thus completing the spiral lamina. This membranous septum is double, and between its layers there is a chamber which contains the teeth of Corti, ranged side by side throughout the whole length of the spiral lamina, and gradually getting shorter from base to apex, like the strings of a harp or pianoforte. The chamber is filled up by a tremulous jelly-like fluid. The diagram, fig. 3, represents a perpendicular section of the spiral

Fig. 3.

a, the osseous septum grooved for the passage of the cochlear nerve *b*, which terminates by a free end inside the chamber *c*, along the floor of which it lies for a short distance; *d*, *d* are the two layers of the membranous septum. Lying in contact with the end of the nerve is the enlarged extremity of a rod *e*, which is connected in a flail-like manner by the hinge *f* to another rod, which is fixed at *g*.

lamina. When the waves or vibrations of sound strike against the bones of the head, those bones are caused to vibrate; this vibration is transmitted through the head to the bones of the cochlea, which in turn set in motion the tremulous jelly which fills up the membranous chamber, c.

AUDLEY, Sir James, one of the original knights of the Order of the Garter, founded in 1344 by Edward III., on his return from France after the victory of Cressy, was frequently in personal attendance on Edward the Black Prince, whom he accompanied to France in 1346. He was so conspicuously brave at the battle of Poictiers, that the prince retained him as his own knight, and declared him to be the bravest soldier on his side. He conferred on him an annual revenue of 500 marks, which A. immediately gave up to his squires. This act of disinterestedness becoming known, the Black Prince conferred a further annual sum of 600 marks upon him. A. also accompanied the Black Prince into Spain, and in 1369 the office of seneschal of Poitou was conferred upon him. He took part in the capture of La-Roche-sur-Yon in Poit— same year, and died a few months after. ' attended his funeral obsequies at Poict

AUDRAN, Gérard, celebrated engravers of was born at Lyon in l to a family distinguishe in this department of art. After years' residence at Rome, where h under Carlo Maratti, and a reputation by his e Clement IX., he was by Colbert, and was app to his majesty Louis engraved the principal works with whom he lived on closest friendship. His a series of engravings illustrating battles of Alexander. He died at 1703.

council. He took an active part and
ry in the battles of Millesimo, Ceva,
(for which he received his title),
, &c. In 1797 he was appointed
to the command of the Army of the Rhine; but in a few months after, the Directory not liking the spirit he displayed there, made him commander of the tenth division at Perpignan. This post he resigned in 1799, when he was elected as deputy into the council of the Five Hundred. In 1801 he received the command of the army in Holland, and was active in several engagements. In 1804 he was made a marshal; and in the following year he commanded a division of the army which reduced the Vorarlberg; and was afterwards engaged at Wetzlar, Jena, Eylau; also in Italy (1809); Spain (1810); Berlin, Bavaria, and Saxony (1813). He died of water in the chest, June 11, 1816.

AUGITE (from Gr. *augē*, brilliancy), or PYROXENE (from Gr. *pyr*, fire, and *xenos*, a guest), a mineral very nearly allied to Hornblende (q. v.), which has, indeed, by some mineralogists been regarded as a variety of it, although the distinction between them is undeniably important, as characterising two distinct series of igneous rocks. A. consists of 47—56 per cent. of silica, 20—25 per cent. of lime, and 12—19 per cent. of magnesia, the magnesia sometimes giving place in whole or in part to protoxide of iron, and some varieties containing a little alumina, or a little protoxide of manganese. Its specific gravity is 3·195—3·525. It is little affected by acids, or not at all. It is usually of a greenish colour, often nearly black. It crystallises in six or

a, Common Augite; *b*, Green Augite.

eight-sided prisms variously modified; it often occurs in crystals, sometimes imbedded, often in grains or scales. It is an essential component of many igneous rocks, particularly of Basalt (q. v.), Dolerite, and Augite-porphyry (see PORPHYRY), from which chiefly it derives its importance as a mineral species. A. Rock, consisting essentially of A. alone, occurs in the Pyrenees. A. is a common mineral in the trap-rocks of Britain and other countries. It is rarely associated with quartz, in which respect it differs from Hornblende, but very often with labradorite, olivine, and leucite. Fluorine, which is generally present in small quantity in hornblende, has never been detected in A. The form of the crystals is also different in the two minerals, as well as their cleavage; but Professor Gustav Rose of Berlin has endeavoured to shew that the difference between A. and hornblende arises only from the different circumstances in which crystallisation has taken place, and that A. is the production of a comparatively rapid, and hornblende of a comparatively slow cooling. He regards some of the varieties as intermediate. His views have been supported by experiments, and by a comparison of A. with certain crystalline substances occurring among the scoriæ of foundries.—*Diopside, Sahlite*, and *Coccolite* are varieties of A.—*Diallage* (q. v.) and *Hypersthene* (q. v.) are very nearly allied to it.

AUGMENTATION, in Heraldry. See HERALDRY.

AUGMENTATION, in Music, is the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of

greater length than those notes in which the melody is first introduced. The tempo remains unaltered. A. is of great importance in the treatment of the subjects, or themes, for fugues, and when cleverly used, produces great effects.

AUGMENTA'TION, Process of, in Scotch law, is an action in the Court of Teinds (q. v.) by the minister of a parish against the titular, or beneficiary, and heritors, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. By 48 Geo. III. c. 138, it is enacted that no A. shall be granted till the expiration of 15 years from any A. previous to the act, nor till the expiration of 20 years from any A. subsequent to the act. A period of 20 years must thus elapse between each augmentation. The amount of the A. is fixed, or modified, as it is termed, in grain or victual; the stipend itself being paid in money, according to the fiars' prices (q. v.) of each year. In addition to the ascertainment or modification of a suitable stipend, regard being had to the state of the teinds, the extent of the parish, the expense of living, and the like—a process of A. has the further object in view of *localling* the stipend so modified—i. e., of assigning it in due proportions to the heritors or other parties in possession of the tithes. This latter object is attained by means of what is called a scheme of locality—i. e., an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior Lord Ordinary (q. v.), on a remit from the Teind Court. The last conclusion in a summons of A. is for a suitable sum, or increase to the sum already allowed, for communion elements—i. e., for bread, wine, and other necessaries for celebrating the sacrament of the Lord's Supper after the Presbyterian fashion. When there is not a sufficient amount of teind to bring the stipend of the minister up to £150 per annum, with £8, 6*s.* 8*d.* for communion elements, it is provided by 50 Geo. III. c. 84, and 5 Geo. IV. c. 72, that the residue shall be paid by the Exchequer. In addition to their stipend, ministers have right to a manse and glebe, or a provision of £50 annually in lieu of them. See Stipend, Glebe, Manse; see also Parliamentary Church.

AU'GSBURG, historically one of the most notable cities in Germany, is situated in the angle between the rivers Wertach and Lech, and is the chief city of the circle of Swabia and Neuburg, in Bavaria. The population is (1871) 51,270. Though presenting an antique and rather deserted appearance, A. has numerous fine buildings, and especially one noble street, the 'imperial' Maximilian Strasse, adorned with bronze fountains. The industry of A. is reviving; several cotton and woollen factories are in operation, as well as manufactories of paper, tobacco, and machinery. Its gold and silver wares still retain their ancient reputation. The art of copper engraving is extinct; but printing, lithography, and bookselling have taken a new start. The *Allgemeine Zeitung*, the most widely circulated paper in Germany, is published here. In 1870 there were 10 printing-establishments and 34 book-shops. There are 74 breweries. Banking and stock-jobbing are extensively carried on; and it is still the emporium of the trade with Italy and Southern Germany. It is the centre of a system of railways connecting it with Nürnberg and Leipsic, with Switzerland, Munich, &c. The foundation of A. was the 'colony' planted by the Emperor Augustus, 12 B.C., after the conquest of the Vindelici, probably on the site of a former residence of that people. It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rhætia, was laid waste by the Huns in the 5th c., and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed. After the division of Charlemagne's empire, it came under the Duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became, in 1276, a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the end of the 14th c. About this time (1368), its aristocratic government was set aside for a democratic, which lasted for 170 years, till the aristocracy, favoured by Charles V., regained the ascendency. A. continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nürnberg it formed the emporium of the trade between Northern Europe and the south, and its merchants were princes whose ships were in all seas. See Fugger. It was also the centre of German art as represented by the Holbeins, Burkmair, Altdorfer, and others. Many diets of the empire were held in A., and the leading events of the Reformation are associated with its name. The discovery of the road to India by the Cape, and of America, turned the commerce of the world into new channels, and dried up the sources of A.'s prosperity. It lost its freedom with the abolition of the German empire in 1806, and was taken possession of by Bavaria.

AU'GSBURG CONFESSION, the chief standard of faith in the Lutheran Church. Its history is the following. With a view to an amicable arrangement of the religious split that had existed many since 1517, Charles V., as protector, had convoked a diet of the empire to Augsburg, 8th April 1530, and had required Protestants a short statement of which they departed from the Catholic Elector, John, of Saxony, therefore, in on his Wittenberg theologians, with head, to draw up articles of faith, to lay before at Torgau. The commissioned doctors took basis, in so far as pure doctrine was articles that had been agreed to conferences held at Marburg and form of resolutions of the Diet Germany against the doctrines of trinal articles supplemented, and newly added, were laid before Melanchthon then, taking the 28 articles foundation, began in Augsburg, in and advice of various Protestant theologians princes and other secular authorities document, which he first called which in the diet itself took the Luther was not present in Augsburg under the ban of the empire, but recourse to in its composition. were in German; the Confession was both and Latin; and Melanchthon laboured incessantly at its improvement till it was presented emperor, June 25. The character of the absence of Luther, had led him, in the composition of the document, to taining a spirit of love, forbearance as well as the utmost brevity and object, which only became gradually the meeting of the diet, was, in give a collected view of the belief Protestants, aiming at the same the calumnies of the Catholics foundation for measures of

URIES AND AUSPICES. These terms
ar to every reader of Roman history, and
es, so frequently employed in English in
y and metaphorical sense, that a vague
their original meaning is caught up even
who know nothing of classical anti-

As, however, the entire religious and
life of the early Romans was deeply pene-
y the influence of their sacred superstitions,
amongst these auguries and auspices held a
st place, a clear conception of what they were
ter of considerable moment. The following
ts exhibit, in a condensed form, the sub-
f what is known on the subject.

almost all primitive nations, the Romans
that every unusual occurrence had a super-
gnificance, and contained, hidden in it, the
leaven regarding men. To reveal or inter-
hidden will, was the exclusive privilege of
r, who apparently derived his official desig-
n part at least, from *avis*, a bird; while
history abundantly proves that the observa-
the flight of birds was a principal means
adopted for discovering the purpose of the gods. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters—that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a 'college of augurs' figures in the very dawn of Roman history. Romulus, it is almost certain, was an augur himself. He is said to have been skilled in the art of divination from his youth; and by 'divination' we must specially understand augury; for the Romans, with patriotic piety, held all the forms of divination practised in other countries to be useless and profane. Previous to the Ogulnian law, passed in the year 307 B. C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than two hundred years, the number continued the same, till Sulla, in 81 B. C., increased it to fifteen. Finally, in the first days of the Empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first, the augurs were elected by the *Comitia Curiata*; but as the sanction of the former was necessary to give validity to the acts of the latter, they could always 'veto' any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B. C., when a tribune of the people named Ahenobarbus carried a law by which it was enacted that for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain picked tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered its prophetic pretensions ridiculous in the eyes of educated people. By Cicero's time, it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurium ex coelo, ex avibus, ex tripudiis, ex quadrupedibus, ex diris*. The *first*, related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and held to be of supreme significance. The *second* related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those 'consulted,' as it was called, were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites*, or birds whose *flight* revealed the will of the gods; the last four to the class of *oscines*, whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the auguries *ex quadrupedibus*, from four-footed animals—as, for instance, if a dog, or wolf, or hare, ran across the path of a Roman, and startled him by any unusual motion, he mentioned it to an augur, who was expected to be able to advise him what to do; the auguries *ex diris* (a vague kind of augury), from any trifling accidents or occurrences not included in the previous four—such as sneezing, stumbling, spilling salt on the table, &c.

At Rome, the auspices were taken on the summit

of the Capitoline Hill; and the ground on which the augur stood was solemnly set apart for the purpose. The latter then took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari*, to contemplate), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favourable or unfavourable. How vast the political influence and authority of the augurs must have been is seen from the fact, that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid if the auspices were unfavourable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians, was held valid—unless the auspices were first taken, while the Comitia of the Centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

We have employed the two terms, auguries and auspices, as synonymous. But a slight difference is perceptible between them: not the augurs only, but the chief magistrates of Rome (inheriting the honour from Romulus), held the 'auspices,' while the 'auguries' were exclusively in the possession of the former; but the mode of divination, and the end to be obtained by it, seem to have been the same in both cases.

The power of taking the auspices in war was confined to the commander-in-chief; and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, 'under the auspices' of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name.

AU'GUST, the sixth month in the Roman year, which began with March, was originally styled *Sextilis*, and received its present name from the Emperor Augustus, on account of several of the most fortunate events of his life having occurred during this month. On this month he was first admitted to the consulate, and thrice entered the city in triumph. On the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. (See Macrobius, i. 12.) As the fifth month, or *Quintilis*, had previously been styled Julius in honour of Julius Cæsar, a day was taken from February to make A. equal with July.

AUGUSTA, the name of two considerable cities in the United States.—1. A. is the capital of Maine, situated principally on the right bank of the Kennebec, which is here crossed by a bridge 520 feet long. Its lat. is 44° 19′ N., and long. 69° 50′ W. Up to A., the river is navigable for sloops from its mouth, a distance of 43 miles, in a straight line; while a dam, constructed immediately above the city, enables steam-boats to ply more than 20 miles above, as far as Waterville. A. is also a station on the railway between Portland and Bangor. The dam, too, which improves the navigation, has created a vast water-power, which is extensively employed for manufacturing purposes. Between 1830 and 1870, the population had increased from 3563 to 7808.—2. A. is the second city in Georgia, on the Savannah, 231 miles from its mouth. Its lat. is 33° 28′ N., and long. 81° 54′ W. Standing at the head of the navigation of the river, it is connected with the interior by the A. and Atlantic Railway, 170 miles long; while to the north again, it communicates with Charleston by means of the South Carolina Railway. The construction of the former of these lines was at first prejudicial to the city; but the internal improvement soon brought more business, though of a different kind, than it had taken away. Another cause of prosperity is a canal, which, from a point 9 miles up, brings the waters of the Savannah to the city on such a level as to furnish a fall of 35 or 40 feet—a water-power which is extensively and profitably employed. Of late years, the population has increased rapidly. In 1870, it numbered 15,389.

AUGU'STENBURG, a village of 800 inhabitants in the centre of the island of Alsen. It is noted for being the residence of the Duke of Holstein-Sonderburg-Augustenburg, for its splendid 'stables,' and for the castle belonging to the ducal family.

AUGU'STI, a learned German theologian, born in 1772 at Eschenberga, near Gotha. He studied at Jena under the celebrated Griesbach, and afterwards devoted himself for some time to public teaching. In 1798, he became lecturer (*privat-docent*) in philosophy, and in 1800 he was appointed professor-extraordinary of the same. Three years after, he succeeded Ilgen in the chair of Oriental Literature; but his love of theological studies becoming predominant, he accepted the offer of a theological professorship in the university of Breslau, where he exerted a wide and beneficial influence. In 1819 he was transferred to Bonn, and made a director of the consistory at Cologne. Other ecclesiastical honours were conferred on him during the course of his life. He died on the 28th April 1841.

In the early part of his career, A. was a decided rationalist; but subsequently he returned to orthodox Lutheranism, more, perhaps, from the conservative bias of his nature, than from any profound conviction of the truth of the national creed. The change, however, was not accompanied, as is usual in such cases, with any intense bigotry. A. remained to the last a liberal-hearted Christian. His writings, marked by great learning, industry, and spirit, are much esteemed by his countrymen. The most important is his *Manual of Christian Archæology* (Leip. 1836—1837).

AUGUSTINE, AURELIUS ST, the greatest Latin fathers, was born at Tagaste, a t Numidia, on the 13th of November 354 A. D. father, Patricius, was poor, but of good f filled the office of magistrate. He continue till advanced in years, and was only baptised before his death. He does not seem to ha remarkable for any elevation of mind; on trary, one may fairly conclude, from his sa ments, that he was an irascible, kind-hearte more intent on his son's advancement in this than in that which is to come. His temper caused great sorrow to his gentle and pi who loved him faithfully, however, and f fore rewarded with the secret by which charm the evil spirit out of him. Patri anxious that A. should become a fine s noticed that not a few people in his day r ing large incomes by their 'wits.' A. w ingly sent to school at Madaura, and af to Carthage, to complete his studies. this, however, he had enjoyed ine of a religious education at m Monnica, had been his best i truly says: 'Whatever tr worth the life of faith, even by scientific culture, can b him in the example of his pi

The energy and penetrati

But strong as temptations of Carthage were stronger. deep, impetuous, and passionate, thirsted nent. He had just reached the age when is conceived to be synonymous with plea- Carthage, the second city of the empire, was Rome in its sensual corruptions. A. fell. *nfessions*, he paints the frightful abyss into f himself plunged; nor does he seek to [illegible]; on the contrary, the shadow of his own forward over all his boyish life, and even a morbid zeal and acuteness in out what others, less censorious, might term lous errors of his childhood, but which to A. the parents of his subsequent vices, fore equally bad and equally reprehensible. had reached his eighteenth year, his mis- [illegible] son, who was named Adeodatus— [illegible]pressed along with him at Milan. The h appears to have first stirred his deeper life was a passage which he suddenly in the *Hortensius* of Cicero, treating of and dignity of philosophy. To use the Neander: 'The conflict now began in which lasted through eleven years of his the simplicity of the sacred Scriptures no attractions for his taste—a taste w rhetorical studies and the artificial dis- declamatory schools—especially as [illegible] now in the same tone and direction of the Emperor Julian, when the latter ducted to the Platonic theosophy; as, he found so many things in the doctrines hurch which, from want of inward experi- ld not be otherwise than unintelligible to ile he attempted to grasp, by the under- from without, what can be understood only inner life, from the feeling of inward wants, own inward experiences; so under these ces, the delusive pretensions of the Mani- s, which, instead of a blind belief on autho- l out the promise of clear knowledge and ctory solution of all questions relating to man and divine, presented the stronger as to his inexperienced youth.' A. now professed Manichæan. Returning to his wn, he lectured for a short time on 'gram- at is to say, on literature. Soon after- returned to Carthage, to pursue his pro- more favourable auspices. Here he [illegible] twenty-seventh year, his first work, *Pulchro*—a treatise on æsthetics, which rtunately been lost. About the same time ual nature became keener and more impera- demands. The futile speculations of the sect to which he had attached himself now apparent. He had a series of interviews rsations with Faustus, one of the most d teachers of Manichæism; and these so lisappointed his expectations, that he left ty in disgust and sad bewilderment, after rasted ten years in a fruitless search for and truth.

he went to Rome, followed by the tears, rs, and the anxieties of his excellent mother, not, however, bereaved of hope, for both her love were strong. After a short me, and proceeded to Milan, where a teacher of rhetoric. No change could re fortunate. At this time, the Bishop was the eloquent and devout St Ambrose. macy sprang up between the two. A. st to hear his friend preach. He was not, however, as yet a Christian. He had only emerged, as it were, from Manichæism—the region of night-clouds and shadows—and was now gazing on the gray dawn of the Platonic philosophy, prophetic of the noon-tide splendours of Christianity which were soon to burst upon his vision. Still, A. did not afterwards despise this preliminary training; he was too great and honest a man for that. He confesses that the Platonic writings 'enkindled in his mind an incredible ardour;' they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, although from a purely Platonic point of view, and rather wishing to find in it 'those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form.' He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that 'highest wisdom' which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that 'he himself was continually borne down by the ungodly impulses which he thought he had already subdued,' the necessity of a living personal God and Saviour to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshipped, shone clear through all the stormy struggles of his heart. In the eighth and ninth books of his *Confessions*, he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say, that the Spirit of God triumphed. On the 25th of April 387 A.D., A., along with his natural son Adeodatus, of whom he seems to have been justly fond, was baptised by Ambrose at Milan. Shortly after, he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, A. wrote his treatises, *De Moribus Ecclesiæ Catholicæ et de Moribus Manichæorum*; *De Quantitate Animæ*; and *De Libero Arbitrio*. It is unnecessary to relate at any length the subsequent life of Augustine. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises *De Genesi Contra Manichæos*, *De Musicâ*, *De Magistro*, and *De Veri Religione*, which secured him a high reputation. In 391, he was ordained a priest by Valerius, Bishop of Hippo; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395, he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. A., as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under PELAGIUS and PELAGIANISM (q.v.). In 397, appeared his *Confessiones*, in 13 books. It is a deep, earnest, and sacred aut [illegible] of one of the greatest intellects the w [illegible]ves of it have no paral [illegible] of

David. In 413, he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most powerful work. Exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. A. was an indifferent scholar: he had studied the Latin authors well; but of Greek 'he knew little, and of Hebrew, nothing.' Many of his reasonings are based on false and untenable premises, and he erred often in his etymological explanations; but in spite of these and other drawbacks, the final impression left on the mind is, that the work is one of the most profound and lasting monuments of human genius. In 428, A. published his *Retractationes*, in which he makes a recension of all his previous writings. It is a work of great candour. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429 the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. A., now in his seventy-sixth year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He died on the 28th of August 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculation in those unfettered days, before creeds were encircled with that traditionary sanctity they now possess. Nevertheless, we have little difficulty in determining the central tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrine of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact (see Neander, Mosheim, and Waddington's Church Histories), that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of A., and thus transmitted to following ages. In his epistle to Dulcitius, a civil magistrate, who shrank from putting in force the edict of Honorius against heretics, he uses these words: 'It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension.' In the opinion of Neander, it was to the somewhat narrow culture, and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematised by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes.

His life has been written by Tillemont, and his entire works have been repeatedly edited. The Benedictine edition, published at Paris in 11 vols. (1679–1700, is the best. Numerous editions of the *Confessions* and the *De Civitate Dei* have also appeared. In the 'Library of Fathers of the Holy Catholic Church,' published by J. H. Parker, there are translations into English of A.'s *Confessions*, *Exposition on St John's Gospel*, and *on the Psalms*, *Sermons on the New Testament*, and *Short Treatises*. His *Sermon on the Mount* has been translated by Trench, and published by Parker and Son.

AUGUSTINE, St, first Archbishop of Canterbury, was originally a monk in the convent of St Andrew at Rome. In 596 he was sent, along with forty other monks, by Pope Gregory I., to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. The missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the king of the Parisians, was a Christian, and retained a Frankish bishop in her suite as chaplain. A residence was assigned to them at Canterbury, then called *Dorovernum*, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day A. baptised 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact, that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labours of A. and his companions.

In 597 he went to Arles, by direction of the pope, and was there consecrated Archbishop of Canterbury and Metropolitan of England. On his return, he despatched a presbyter and monk to Rome, to inform the pope of his success, and obtain instruction on certain questions. Gregory's advices with regard to the propagation of the faith are admirable examples of that pious ingenuity which has often characterised the missionary policy of the Church of Rome. Thus, instead of destroying the heathen temples, A. was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. A.'s subsequent efforts to establish his authority over the native British church were not so successful as his missionary labours. He died in 604, and was buried in the churchyard of the monastery bearing his name, founded by King Ethelbert. His body was removed to the cathedral of Canterbury in 1091. Bede's *Historia Ecclesiastica Gentis Anglorum* is the great authority for the life of St Augustine. A thoughtful and pleasing sketch of it will be found in the Rev. Arthur P. Stanley's *Historical Memorials of Canterbury*. Lond. 1855.

The site and remains of St A.'s monastery were purchased in 1844 by Mr Beresford Hope, by whom they were presented to the Archbishop of Canterbury in trust, for the erection of a missionary college in connection with the Church of England. This institution was incorporated by royal charter in 1848. The buildings, in which as much of the ancient structure as possible has been preserved, contain accommodation for about 45 students, whose course of study extends over three years. Twenty exhibitions have been founded in connection with the college.

AUGUSTINES, or AUGUSTINIANS, name given to several religious bodies in the Roman Catholic Church. Whether St Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as thirty monastic fraternities, of which the chief were the Canons Regular, the Knights

Templars (q. v.), the Begging Hermits, the Friars Preachers or Dominicans (q. v.), and the Premonstratensians (q. v.). The CANONS REGULAR OF ST AUGUSTINE, or AUSTIN CANONS, appear to have been founded or remodelled about the middle of the 11th c. Their discipline was less severe than that of monks properly so called, but more rigid than that of the secular or parochial clergy. They lived under one roof, having a common dormitory and refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. In England, where they were established early in the 12th c., they had about 170 houses, the earliest, it would seem, being at Nostell, near Pontefract, in Yorkshire. In Scotland, they had about 25 houses: the earliest at Scone was founded in 1114, and filled by canons from Nostell; the others of most note were at Inchcolm in the Firth of Forth, St Andrews, Holyrood, Cambuskenneth, and Inchaffray.

The BEGGING HERMITS, HERMITS OF ST AUGUSTINE, or AUSTIN FRIARS, were a much more austere order, renouncing all property, and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the 11th and 12th centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the rival fraternities of Dominicans and Franciscans, Pope Innocent IV., about the middle of the 13th c., imposed on them the rule of St Augustine, whom they claimed as their founder. In 1256, Pope Alexander IV. placed them under the control of a superior or president called a 'general.' In 1287, a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570, Friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalceati*, or 'barefooted friars.'

The degeneracy of the order in the 14th c., called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. But in his day, even these had fallen victims to the general corruption of the priesthood, and he inflicted serious injury upon it by his unsparing denunciations. After the French Revolution, the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and Southern Germany. It was diminished even in Austria and Naples. It is most powerful in Sardinia and America.

The name of AUGUSTINES was given also to an order of nuns who claimed descent from a convent founded by St Augustine at Hippo, and of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. The Hôtel-Dieu at Paris is still served by them.

AUGU'STULUS, ROMULUS, the last emperor of the western portion of the Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential littleness of his character. He was the son of Orestes, a Pannonian of birth and wealth, who rose to high rank under the Emperor Julius Nepos, whose favour he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the emperor, Orestes conferred the vacant throne on his son A. (476 A. D.), retaining all substantial power in his own hands. Orestes, failing to conciliate the barbarians, who had helped him against Nepos, with a grant of the third of the lands of Italy, they, under the command of Odoacer, besieged him in Pavia, and capturing, put him to death. A. yielded at once, and being of too little consequence to be put to death, he was dismissed to a villa near Naples with an annual pension of 6000 pieces of gold. His after-fate is unknown.

AUGU'STUS, CAIUS JULIUS CÆSAR OCTAVIANUS, the son of Octavius and Atia (daughter of Julia, the younger sister of Julius Cæsar), was born 23d September B. C. 63. The Octavian family came originally from Velitræ, in the country of the Volsci; and the branch from which A. descended was rich and honourable. His father had risen to the rank of senator and prætor, but died in the prime of life, when A. was only four years old. A. was carefully educated in Rome under the guardianship of his mother and his step-father, Lucius Marcius Philippus. At the age of 12, A. delivered a funeral oration over his grandmother; at 16, he received the toga virilis. The talents of the youth recommended him to his grand-uncle, Julius Cæsar, who adopted A. as his son and heir. At the time of Cæsar's assassination (March 15, B. C. 44), A. was a student under the celebrated orator Apollodorus, at Apollonia in Illyricum, where, however, he had been sent, chiefly with a view to gain practical instruction in military affairs. He returned to Italy, assuming the name of Julius Cæsar Octavianus, and at his landing at Brundusium, was welcomed by deputies from the veterans there assembled; but declining their offers, he chose to enter Rome privately. The city was at this time divided between the two parties of the republicans and the friends of Mark Antony; but the latter had, by adroit manœuvres, gained the ascendency, and enjoyed almost absolute power. A. was at first haughtily treated by the consul, who refused to surrender the property of Cæsar. After some fighting, in which Antony was worsted, and had to flee across the Alps, A., who had made himself a favourite with the people and the army, succeeded in getting the will of Julius Cæsar carried out. He found an able friend and advocate in Cicero, who had at first regarded him with contempt. The great orator, while imagining that he was labouring in behalf of the republic, was in fact only an instrument for raising A. to supreme power. When Antony returned from Gaul with Lepidus, A. joined them in establishing a triumvirate. He obtained Africa, Sardinia, and Sicily; Antony, Gaul; and Lepidus, Spain. Their power was soon made absolute by the massacre of those unfriendly to them in Italy, and by victories over the republican army in Macedonia, commanded by Brutus and Cassius. After the battle of Philippi, won by A. and Antony, of which the former unjustly claimed all the credit, whereas it mainly belonged to the latter, the triumvirs made a new division of the provinces A. obtaining Italy, and Lepidus, Africa. The Perusian war, excited by Fulvia, wife of Antony, seemed likely to lead to a contest between A. and his rival; but was ended by the death of Fulvia, and the subsequent marriage of Antony with Octavia, sister of Augustus. Shortly afterwards, the claims of Sextus Pompeius and Lepidus having been settled by force and fraud, the Roman world was divided between A. and Antony; and a contest for supremacy commenced between them. While Antony was lost in luxurious dissipation at the court of Cleopatra, A. was industriously striving to gain the love and confidence of the Roman people, and to damage his rival in public estimation. At length war was declared against the queen of Egypt, and at the naval battle of Actium (q. v.), B. C. 31, A. was victorious, and became sole ruler of the whole Roman world. Soon afterwards, Antony and Cleopatra ended their lives by suicide. The son of Antony by Fulvia, of Cæsar and Cleopatra, were in B. C. 29, after disposing of

Greece, Syria, and Asia Minor, A. returned to Rome in triumph, and closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favour, he abolished the laws of the triumvirate, adorned the city of Rome, and reformed many abuses. At the end of his seventh consulship (B. C. 27), he proposed to retire from office, in order that the old republican form of government might be re-established, but he was ultimately induced to retain his power. Hitherto, since Cæsar's death, the consul had been named Octavian; but now the title of *Augustus* (meaning 'sacred' or 'consecrated') was conferred on him. In the eleventh consulship of A. (B.C. 23), the tribunitian power was conferred on him for life by the senate. Republican names and forms still remained, but they were mere shadows. A. was in all but name absolute monarch. In 12 B.C., on the death of Lepidus, he had the high title of Pontifex Maximus, or High Priest, bestowed on him. The nation surrendered to him all the power and honour that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, &c., A. (9 B.C.) suffered the greatest defeat he had sustained in the course of his long rule, in the person of Quintilius Varus, whose army was totally destroyed by the Germans.

This loss so afflicted A., that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: 'O Varus, restore me my legions!' From this time A. confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, 'A. found the city built of bricks, and left it built of marble.' He also founded cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the senate, the name Augustus was given to the month Sextilis.

Though surrounded thus with honour and prosperity, A. was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and Marcellus, the son of his sister, and Caius and Lucius, the sons of his daughter, whom he had appointed as his successors and heirs, as well as his favourite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, domestic sorrows, and failing health, warned him to seek rest; and, to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (August 19, A.D. 14), in the seventy-seventh year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: 'Have I played my part well? If so, applaud me!' A. had consummate tact and address as a ruler and politician, and could keep his plans in secrecy while he made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by A. himself. He encouraged agriculture, patronised the arts and literature, and was himself an author; but only a few fragments of his writings have been preserved. Horace, Virgil, and all the most celebrated Latin poets and scholars, were his friends. His was the *Augustan Age* of literature. His death threw a shade of sorrow over the whole Roman world; the bereaved people erected temples and altars to his memory, and numbered him among the gods.

AUGUSTUS, Elector of Saxony (1553—1586), son of Duke Henry the Pious, and of Katherine of Mecklenburg, was born July 31, 1526, at Freiberg, then the seat of his father's court. While still a youth, he spent some time at Prague, and there formed an intimate friendship with Maximilian, King Ferdinand's son, afterwards Emperor of Germany. In 1548 he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and of her domestic worth. After the death of his brother, Maurice, in 1553, A. succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant Church. Equally intolerant and inconsistent in his theology, A. first used his utmost influence in favour of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, however, it must be owned, to his honour, that, by his skilful internal administration, he raised his country far above the level of any other in Germany, introducing valuable reforms both in jurisprudence and finance, and giving a decided impetus to education, agriculture, manufactures, and commerce. He even wrote a book on the management of orchards and gardens, and commanded that every newly-married pair should, within the first year of their marriage, plant two fruit-trees. The Dresden Library owes its origin to him, as do also most of its galleries of art and science. His own favourite private pursuit was that of alchemy, in which the Electress Anna also took a part. In the January of 1586—the electress having died in the previous year—A. married a young princess of Anhalt, but died a month after, and was buried in the cathedral of Freiberg. He was succeeded by his son, Christian I.

AUGU'STUS II., FREDERICK, commonly called the Strong, Elector of Saxony and king of Poland, second son of the elector, John George III., and of the Danish princess, Anna Sophia, was born at Dresden in 1670. His extraordinary strength was developed by a careful physical education, and his mental faculties more successfully cultivated than his morals. From 1687 to 1689 he travelled over the greatest part of Europe, but was prohibited by his father from visiting Rome. Upon his father's death (1691), he went to Vienna, and there formed an intimacy with Joseph, king of Rome, which materially influenced his politics. When, in 1694, he succeeded to his brother George as Elector, instead of turning his arms against France, according to previous arrangement, he undertook the command of the Austro-Saxon army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than Prince Conti for the crown (10 million Polish florins), and adopting the Catholic faith, he was elected king by the venal nobles; and having, by his imposing force, awed the adherents of Conti, he was crowned at Cracow, 15th September 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leczynski, and the ignominious peace of Altranstädt in 1706. So complete was his humiliation, that A. was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on receiving intelligence of the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstädt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII. at Frederickshall, in 1718, gave a new aspect to affairs, leading first to

AUK (*Alca*), a genus of web-footed birds, the type of a family called *Alcadæ*, which was in great part included in the Linnæan genus *Alca*, and to many of the species of which, now ranked in other genera, the name A. is still popularly extended. The *Alcadæ* are amongst those web-footed birds collectively called *Brachypterra* (i. e., short-winged) or Divers by Cuvier, remarkable for the shortness of their

Great and Little Auks.

wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and compels them, when on land, to maintain an upright attitude. They are distinguished by the very compressed bill, which, in the true auks, is vertically elevated, and so sharp along the ridge as to resemble the blade of a knife; and by their entirely palmated feet, destitute of hind toes. The auks are entirely confined to the seas of the northern hemisphere—the penguins taking their place in the southern—and are most abundant in the colder regions. All of them have a dense plumage, which generally exhibits on its surface a beautifully polished appearance and silvery lustre. The genus *Alca*, as restricted by Cuvier and others, contains only two species, distinguished from the Puffins (q. v.), which also belong to this family, chiefly by the greater length of the bill, and its being covered with feathers as far as the nostrils. The bill, both in the auks and puffins, is transversely and strongly grooved. But even the two known species of the restricted genus *Alca* differ from one another in a most important particular—the wings of the one, the Great A., being so short that it is quite incapable of flight, like the penguins, of which it may be deemed the true northern representative, whilst the other, the Razor-bill, has comparatively long wings, and flies well.—The Great A. (*Alca impennis*) is as large as a goose. It is an inhabitant of the most northerly shores, and a very rare visitant of those of the Orkney and Shetland Islands and the Hebrides. It is almost equally rare in Norway and Sweden, and has nearly disappeared even from Iceland and Greenland, and from localities on the coasts of Labrador and Newfoundland, where it is said to have been formerly frequent. The rapidity with which this bird moves under water is extraordinary: one of them has been pursued by a six-oared boat for hours in vain. Like most of the *Alcadæ*, the Great A. lays only one egg, which is very large, about five inches in length, and three in its greatest breadth.

greater length than those notes in which the melody is first introduced. The tempo remains unaltered. A. is of great importance in the treatment of the subjects, or themes, for fugues, and when cleverly used, produces great effects.

AUGMENTA'TION, Process of, in Scotch law, is an action in the Court of Teinds (q. v.) by the minister of a parish against the titular, or beneficiary, and heritors, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. By 48 Geo. III. c. 138, it is enacted that no A. shall be granted till the expiration of 15 years from any A. previous to the act, nor till the expiration of 20 years from any A. subsequent to the act. A period of 20 years must thus elapse between each augmentation. The amount of the A. is fixed, or modified, as it is termed, in grain or victual; the stipend itself being paid in money, according to the fiars' prices (q. v.) of each year. In addition to the ascertainment or modification of a suitable stipend, regard being had to the state of the teinds, the extent of the parish, the expense of living, and the like—a process of A. has the further object in view of *localling* the stipend so modified—i. e., of assigning it in due proportions to the heritors or other parties in possession of the tithes. This latter object is attained by means of what is called a scheme of locality—i. e., an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior Lord Ordinary (q. v.), on a remit from the Teind Court. The last conclusion in a summons of A. is for a suitable sum, or increase to the sum already allowed, for communion elements—i. e., for bread, wine, and other necessaries for celebrating the sacrament of the Lord's Supper after the Presbyterian fashion. When there is not a sufficient amount of teind to bring the stipend of the minister up to £150 per annum, with £8, 6s. 8*d.* for communion elements, it is provided by 50 Geo. III. c. 84, and 5 Geo. IV. c. 72, that the residue shall be paid by the Exchequer. In addition to their stipend, ministers have right to a manse and glebe, or a provision of £50 annually in lieu of them. See Stipend, Glebe, Manse; see also Parliamentary Church.

AU'GSBURG, historically one of the most notable cities in Germany, is situated in the angle between the rivers Wertach and Lech, and is the chief city of the circle of Swabia and Neuburg, in Bavaria. The population is (1871) 51,270. Though presenting an antique and rather deserted appearance, A. has numerous fine buildings, and especially one noble street, the 'imperial' Maximilian Strasse, adorned with bronze fountains. The industry of A. is reviving; several cotton and woollen factories are in operation, as well as manufactories of paper, tobacco, and machinery. Its gold and silver wares still retain their ancient reputation. The art of copper engraving is extinct; but printing, lithography, and bookselling have taken a new start. The *Allgemeine Zeitung*, the most widely circulated paper in Germany, is published here. In 1870 there were 10 printing-establishments and 34 book-shops. There are 74 breweries. Banking and stock-jobbing are extensively carried on; and it is still the emporium of the trade with Italy and Southern Germany. It is the centre of a system of railways connecting it with Nürnberg and Leipsic, with Switzerland, Munich, &c. The foundation of A. was the 'colony' planted by the Emperor Augustus, 12 B.C., after the conquest of the Vindelici, probably on the site of a former residence of that people. It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rhætia, was laid waste by the Huns in the 5th c., and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed. After the division of Charlemagne's empire, it came under the Duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became, in 1276, a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the end of the 14th c. About this time (1368), its aristocratic government was set aside for a democratic, which lasted for 170 years, till the aristocracy, favoured by Charles V., regained the ascendency. A. continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nürnberg it formed the emporium of the trade between Northern Europe and the south, and its merchants were princes whose ships were in all seas. See Fugger. It was also the centre of German art as represented by the Holbeins, Burkmair, Altdorfer, and others. Many diets of the empire were held in A., and the leading events of the Reformation are associated with its name. The discovery of the road to India by the Cape, and of America, turned the commerce of the world into new channels, and dried up the sources of A.'s prosperity. It lost its freedom with the abolition of the German empire in 1806, and was taken possession of by Bavaria.

I ES AND AUSPICES. These terms e to every reader of Roman history, and , so frequently employed in English in and metaphorical sense, that a vague eir original meaning is caught up even who know nothing of classical anti- As, however, the entire religious and life of the early Romans was deeply pene- y the influence of their sacred superstitions, amongst these auguries and auspices held a st place, a clear conception of what they were ter of considerable moment. The following ns exhibit, in a condensed form, the sub- is known on the subject.

all primitive nations, the Romans unusual occurrence had a super- and contained, hidden in it, the rding men. To reveal or inter- was the exclusive privilege of who apparently derived his official desig- part at least, from *avis*, a bird; while history abundantly proves that the observa- the flight of birds was a principal means adopted for discovering the purpose of the gods. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters —that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a 'college of augurs' figures in the very dawn of Roman history. Romulus, it is almost certain, was an augur himself. He is said to have been skilled in the art of divination from his youth; and by 'divination' we must specially understand augury; for the Romans, with patriotic piety, held all the forms of divination practised in other countries to be useless and profane. Previous to the Ogulnian law, passed in the year 307 B. C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than two hundred years, the number continued the same, till Sulla, in 81 B. C., increased it to fifteen. Finally, in the first days of the Empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first, the augurs were elected by the *Comitia Curiata*; but as the sanction of the former was necessary to give validity to the acts of the latter, they could always 'veto' any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B. C., when a tribune of the people named Ahenobarbus carried a law by which it was enacted that for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain picked tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered its prophetic pretensions ridiculous in the eyes of educated people. By Cicero's time, it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurium ex coelo, ex avibus, ex tripudiis, ex quadrupedibus, ex diris*. The *first*, related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and held to be of supreme significance. The *second* related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those 'consulted,' as it was called, were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites*, or birds whose *flight* revealed the will of the gods; the last four to the class of *oscines*, whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the s *ex quadrupedibus*, from four-footed an , if a dog, or wolf, or hare, ran a path a n, and startled him by any unt he med it to an augur, who was e be able to advise him what to do; the *ex diris* (a vague kind of r). from any accidents or occurrences ad as sneezing, mit

of the Capitoline Hill; and the ground on which the augur stood was solemnly set apart for the purpose. The latter then took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari*, to contemplate), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favourable or unfavourable. How vast the political influence and authority of the augurs must have been is seen from the fact, that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid if the auspices were unfavourable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians, was held valid—unless the auspices were first taken, while the Comitia of the Centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

We have employed the two terms, auguries and auspices, as synonymous. But a slight difference is perceptible between them: not the augurs only, but the chief magistrates of Rome (inheriting the honour from Romulus), held the 'auspices,' while the 'auguries' were exclusively in the possession of the former; but the mode of divination, and the end to be obtained by it, seem to have been the same in both cases.

The power of taking the auspices in war was confined to the commander-in-chief; and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, 'under the auspices' of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name.

AU'GUST, the sixth month in the Roman year, which began with March, was originally styled *Sextilis*, and received its present name from the Emperor Augustus, on account of several of the most fortunate events of his life having occurred during this month. On this month he was first admitted to the consulate, and thrice entered the city in triumph. On the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. (See Macrobius, i. 12.) As the fifth month, or *Quintilis*, had previously been styled Julius in honour of Julius Cæsar, a day was taken from February to make A. equal with July.

AUGU'STA, the name of two considerable cities in the United States.—1. A. is the capital of Maine, situated principally on the right bank of the Kennebec, which is here crossed by a bridge 520 feet long. Its lat. is 44° 19′ N., and long. 69° 50′ W. Up to A., the river is navigable for sloops from its mouth, a distance of 43 miles, in a straight line; while a dam, constructed immediately above the city, enables steam-boats to ply more than 20 miles above, as far as Waterville. A. is also a station on the railway between Portland and Bangor. The dam, too, which improves the navigation, has created a vast water-power, which is extensively employed for manufacturing purposes. Between 1830 and 1870, the population had increased from 3984 to 7808.—2. A. is the second city in Georgia, on the Savannah, 231 miles from its mouth. Its lat. is 33° 28′ N., and long. 81° 54′ W. Standing at the head of the navigation of the river, it is connected with the interior by the A. and Atlantic Railway, 170 miles long; while to the north again, it communicates with Charleston by means of the South Carolina Railway. The construction of the former of these lines was at first prejudicial to the city; but the internal improvement soon brought more business, though of a different kind, than it had taken away. Another cause of prosperity is a canal, which, from a point 9 miles up, brings the waters of the Savannah to the city on such a level as to furnish a fall of 35 or 40 feet—a water-power which is extensively and profitably employed. Of late years, the population has increased rapidly. In 1870, it numbered 15,389.

AUGU'STENBURG, a village of 800 inhabitants in the centre of the island of Alsen. It is noted for being the residence of the Duke of Holstein-Sonderburg-Augustenburg, for its splendid 'stables,' and for the castle belonging to the ducal family.

AUGU'STI, a learned German theologian, born in 1772 at Eschenberga, near Gotha. He studied at Jena under the celebrated Griesbach, and afterwards devoted himself for some time to public teaching. In 1798, he became lecturer (*privat-docent*) in philosophy, and in 1800 he was appointed professor-extraordinary of the same. Three years after, he succeeded Ilgen in the chair of Oriental Literature; but his love of theological studies becoming predominant, he accepted the offer of a theological professorship in the university of Breslau, where he exerted a wide and beneficial influence. In 1819 he was transferred to Bonn, and made a director of the consistory at Cologne. Other ecclesiastical honours were conferred on him during the course of his life. He died on the 28th April 1841.

In the early part of his career, A. was a decided rationalist; but subsequently he returned to orthodox Lutheranism, more, perhaps, from the conservative bias of his nature, than from any profound conviction of the truth of the national creed. The change, however, was not accompanied, as is usual in such cases, with any intense bigotry. A. remained to the last a liberal-hearted Christian. His writings, marked by great learning, industry, and spirit, are much esteemed by his countrymen. The most important is his *Manual of Christian Archæology* (Leip. 1836—1837).

AUGUSTINE, Aurelius St, the great Latin fathers, was born at T[illegible], Numidia, on the 13th of Nov[illegible]. His father, Patricius, was poor, but [illegible] filled the office of magistrate. He co[illegible] till advanced in years, and was [illegible] before his death. He does no[illegible] remarkable for any elevation of [illegible]; trary, one may fairly conclude, from his [illegible] ments, that he was an irascible, kind-h[illegible] more intent on his son's advancement in [illegible] than in that which is to come. His [illegible] caused great sorrow to his gentle [illegible] who loved him faithfully, however, [illegible] fore rewarded with the secret by [illegible] charm the evil spirit out of him. [illegible] anxious that A. should become a [illegible] noticed that not a few people in [illegible] ing large incomes by their 'wit[illegible]. A. [illegible] ingly sent to school at Madaura, and [illegible] to Carthage, to complete his studies. [illegible] this, however, he had enjoyed the ine[illegible] of a religious education at h[illegible]. Monnica, had been his best [illegible] truly says: 'Whatever [illegible] worth the life of faith, e[illegible] by scientific culture, [illegible] him in the example of [illegible]. The energy and pene[illegible]

yo A. ex l the most flattering hopes.

t is to say, on literature. Soon after-
... returned to Carthage, to pursue his pro-
under more favourable auspices. Here he
in his twenty-seventh year, his first work,
et Pulchro—a treatise on æsthetics, which
ortunately been lost. About the same time
nature became keener and more impera-
... nda. The futile speculations of the
... so which he had attached himself now
apparent. He had a series of interviews
iversations with Faustus, one of the most
ed teachers of Manichæism; and these so
disappointed his expectations, that he left
sty in disgust and sad bewilderment, after
wasted ten years in a fruitless search for
and truth.
3 he went to Rome, followed by the tears,
ers, and the anxieties of his excellent mother,
s not, however, bereaved of hope, for both
h and her love were strong. After a short
left Rome, and proceeded to Milan, where
me a teacher of rhetoric. No change could
en more fortunate. At this time, the Bishop
a was the eloquent and devout St Ambrose.
y sprang up between the two. A.
o hear his friend preach. He was not, however, as yet a Christian. He had only emerged, as it were, from Manichæism—the region of night-clouds and shadows—and was now gazing on the gray dawn of the Platonic philosophy, prophetic of the noon-tide splendours of Christianity which were soon to burst upon his vision. Still, A. did not afterwards despise this preliminary training; he was too great and honest a man for that. He confesses that the Platonic writings 'enkindled in his mind an incredible ardour;' they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, although from a purely Platonic point of view, and rather wishing to find in it 'those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form.' He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that 'highest wisdom' which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that 'he himself was continually borne down by the ungodly impulses which he thought he had already subdued,' the necessity of a living personal God and Saviour to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshipped, shone clear through all the stormy struggles of his heart. In the eighth and ninth books of his *Confessions*, he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say, that the Spirit of God triumphed. On the 25th of April 387 A.D., A., along with his natural son Adeodatus, of whom he seems to have been justly fond, was baptised by Ambrose at Milan. Shortly after, he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, A. wrote his treatises, *De Moribus Ecclesiæ Catholicæ et de Moribus Manichæorum*; *De Quantitate Animæ*; and *De Libero Arbitrio*. It is unnecessary to relate at any length the subsequent life of Augustine. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises—*De Genesi Contra Manichæos*, *De Musicâ*, *De Magistro*, and *De Veri Religione*, which secured him a high reputation. In 391, he was ordained a priest by Valerius, Bishop of Hippo; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395, he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. A., as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under PELAGIUS and PELAGIANISM (q.v.). In 397, appeared his *Confessiones*, in 13 books. It is a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. Passages of it have no parallel except in the Psalms of

David. In 413, he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most powerful work. Exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. A. was an indifferent scholar: he had studied the Latin authors well; but of Greek 'he knew little, and of Hebrew, nothing.' Many of his reasonings are based on false and untenable premises, and he erred often in his etymological explanations; but in spite of these and other drawbacks, the final impression left on the mind is, that the work is one of the most profound and lasting monuments of human genius. In 428, A. published his *Retractationes*, in which he makes a recension of all his previous writings. It is a work of great candour. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429 the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. A., now in his seventy-sixth year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He died on the 28th of August 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculation in those unfettered days, before creeds were encircled with that traditionary sanctity they now possess. Nevertheless, we have little difficulty in determining the central tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrine of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact (see Neander, Mosheim, and Waddington's Church Histories), that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of A., and thus transmitted to following ages. In his epistle to Dulcitius, a civil magistrate, who shrank from putting in force the edict of Honorius against heretics, he uses these words: 'It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension.' In the opinion of Neander, it was to the somewhat narrow culture, and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematised by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes.

His life has been written by Tillemont, and his entire works have been repeatedly edited. The Benedictine edition, published at Paris in 11 vols. (1679–1700), is the best. Numerous editions of the *Confessions* and the *De Civitate Dei* have also appeared. In the 'Library of Fathers of the Holy Catholic Church,' published by J. H. Parker, there are translations into English of A.'s *Confessions*, *Exposition on St John's Gospel*, and *on the Psalms*, *Sermons on the New Testament*, and *Short Treatises*. His *Sermon on the Mount* has been translated by Trench, and published by Parker and Son.

AUGUSTINE, St, first Archbishop of Canterbury, was originally a monk in the convent of St Andrew at Rome. In 596 he was sent, along with forty other monks, by Pope Gregory I. to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. The missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the king of the Parisians, was a Christian, and retained a Frankish bishop in her suite as chaplain. A residence was assigned to them at Canterbury, then called *Dorovernum*, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day A. baptised 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact, that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labours of A. and his companions.

In 597 he went to Arles, by direction [illegible], and was there consecrated Archbishop [illegible] bury and Metropolitan of England. On [illegible], he despatched a presbyter and monk to [illegible] inform the pope of his success, and obtain [illegible] tion on certain questions. Gregory's advice regard to the propagation of the faith are adm examples of that pious ingenuity which has characterised the missionary policy of Chu Rome. Thus, instead of destroying [illegible] temples, A. was recommended to con[illegible] Christian churches, by washing the [illegible] water, erecting altars, and substituting [illegible] and symbols for the images of the heathen gods. A.'s subsequent efforts to establish his authority over the native British church were not so successful as his missionary labours. He died in 604, and was buried in the churchyard of the monastery bearing his name, founded by King Ethelbert. His body was removed to the cathedral of Canterbury in 1091. Bede's *Historia Ecclesiastica Gentis Anglorum* is the great authority for the life of St Augustine. A thoughtful and pleasing sketch of it will be found in the Rev. Arthur P. Stanley's *Historical Memorials of Canterbury*. Lond. 1855.

The site and remains of St A.'s monastery were purchased in 1844 by Mr Beresford Hope, by whom they were presented to the Archbishop of Canterbury in trust, for the erection of a missionary college in connection with the Church of England. This institution was incorporated by royal charter in 1848. The buildings, in which as much of the ancient structure as possible has been preserved, contain accommodation for about 45 students, whose course of study extends over three years. Twenty exhibitions have been founded in connection with the college.

AUGUSTINES, or **AUGUSTINIANS**, name given to several religious bodies in the Roman Catholic Church. Whether St Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as thirty monastic fraternities, of which the chief were the Canons Regular, the Knights

(q. v.), the Begging Hermits, the Friars
or Dominicans (q. v.), and the Premon-
ss (q. v.). The CANONS REGULAR OF ST
, or AUSTIN CANONS, appear to have been
remodelled about the middle of the
ir discipline was less severe than that of
properly so called, but more rigid than that
secular or parochial clergy. They lived under
f, having a common dormitory and refectory.
abit was a long cassock, with a white rochet
all covered by a black cloak or hood, whence
ere often called Black Canons. In England,
they were established early in the 12th c.,
ad about 170 houses, the earliest, it would
eing at Nostell, near Pontefract, in York-
In Scotland, they had about 25 houses: the
at Scone was founded in 1114, and filled
ons from Nostell; the others of most note
Inchcolm in the Firth of Forth, St Andrews,
Cambuskenneth, and Inchaffray.

GOING HERMITS, HERMITS OF ST AUGUS-
AUSTIN FRIARS, were a much more austere
ing all property, and vowing to live
ordinary alms of the faithful. They are
d to have sprung from certain societies of
s who, in the 11th and 12th centuries,
especially in Italy without any regulative
ation. At the instigation, as is alleged, of the
raternities of Dominicans and Franciscans,
sent IV., about the middle of the 13th c.,
m the rule of St Augustine, whom they
as their founder. In 1256, Pope Alexander
ced them under the control of a superior or
at called a 'general.' In 1287, a code of rules
stitutions was compiled, by which the order
ntinued to be governed. About 1570, Friar
s of Jesus, a Portuguese brother of the order,
l a more austere rule, the disciples of which
idden to wear shoes, whence they were
calceati, or 'barefooted friars.'
degeneracy of the order in the 14th c., called
istence new or reformed Augustinian societies,
which was that Saxon one to which Luther
ed. But in his day, even these had fallen
to the general corruption of the priesthood,
afflicted serious injury upon it by his unspar-
nunciations. After the French Revolution,
er was wholly suppressed in France, Spain,
ortugal, and partly in Italy and Southern
ay. It was diminished even in Austria and
. It is most powerful in Sardinia and
a.

name of AUGUSTINES was given also to an
f nuns who claimed descent from a convent
d by St Augustine at Hippo, and of which his
ras the first abbess. They were vowed to the
the sick and the service of hospitals. The
Dieu at Paris is still served by them.

GU'STULUS, ROMULUS, the last emperor of
stern portion of the Roman empire. His
ras Augustus, but the diminutive title under
he is universally known was given him by
mans on account of the essential littleness of
racter. He was the son of Orestes, a Panno-
f birth and wealth, who rose to high rank
the Emperor Julius Nepos, whose favour he
by stirring up the barbarian troops in the pay
se to mutiny against him. On the flight of
peror, Orestes conferred the vacant throne on
A. (476 A. D.), retaining all substantial power
own hands. Orestes, failing to conciliate the
ians, who had helped him against Nepos, with
t of the third of the lands of Italy, they, under
ommand of Odoacer, besieged him in Pavia,
pturing, put him to death. A. yielded at
ad being of too little consequence to be put
to death, he was dismissed to a villa near Naples
with an annual pension of 6000 pieces of gold. His
after-fate is unknown.

AUGU'STUS, CAIUS JULIUS CÆSAR OCTAVIANUS,
the son of Octavius and Atia (daughter of Julia,
the younger sister of Julius Cæsar), was born 23d
September B. C. 63. The Octavian family came origin-
ally from Velitræ, in the country of the Volsci; and
the branch from which A. descended was rich and
honourable. His father had risen to the rank of
senator and prætor, but died in the prime of life,
when A. was only four years old. A. was carefully
educated in Rome under the guardianship of his
mother and his step-father, Lucius Marcius Philip-
pus. At the age of 12, A. delivered a funeral
oration over his grandmother; at 16, he received
the toga virilis. The talents of the youth recom-
mended him to his grand-uncle, Julius Cæsar, who
adopted A. as his son and heir. At the time of
Cæsar's assassination (March 15, B. C. 44), A. was a
student under the celebrated orator Apollodorus, at
Apollonia in Illyricum, where, however, he had been
sent, chiefly with a view to gain practical instruc-
tion in military affairs. He returned to Italy,
assuming the name of Julius Cæsar Octavianus, and
at his landing at Brundusium, was welcomed by
deputies from the veterans there assembled; but
declining their offers, he chose to enter Rome
privately. The city was at this time divided between
the two parties of the republicans and the friends
of Mark Antony; but the latter had, by adroit
manœuvres, gained the ascendency, and enjoyed
almost absolute power. A. was at first haughtily
treated by the consul, who refused to surrender the
property of Cæsar. After some fighting, in which
Antony was worsted, and had to flee across the
Alps, A., who had made himself a favourite with the
people and the army, succeeded in getting the will
of Julius Cæsar carried out. He found an able
friend and advocate in Cicero, who had at first
regarded him with contempt. The great orator,
while imagining that he was labouring in behalf of
the republic, was in fact only an instrument for
raising A. to supreme power. When Antony
returned from Gaul with Lepidus, A. joined them
in establishing a triumvirate. He obtained Africa,
Sardinia, and Sicily; Antony, Gaul; and Lepidus,
Spain. Their power was soon made absolute by the
massacre of those unfriendly to them in Italy, and
by victories over the republican army in Macedonia,
commanded by Brutus and Cassius. After the
battle of Philippi, won by A. and Antony, of which
the former unjustly claimed all the credit, whereas
it mainly belonged to the latter, the triumvirs made
a new division of the provinces. A. obtaining Italy,
and Lepidus, Africa. The Perusian war, excited by
Fulvia, wife of Antony, seemed likely to lead to a
contest between A. and his rival; but was ended by
the death of Fulvia, and the subsequent marriage
of Antony with Octavia, sister of Augustus. Shortly
afterwards, the claims of Sextus Pompeius and
Lepidus having been settled by force and fraud, the
Roman world was divided between A. and Antony;
and a contest for supremacy commenced between
them. While Antony was lost in luxurious dissipa-
tion at the court of Cleopatra, A. was industriously
striving to gain the love and confidence of the
Roman people, and to damage his rival in public
estimation. At length war was declared against the
queen of Egypt, and at the naval battle of Actium
(q. v.), B. C. 31, A. was victorious, and became sole
ruler of the whole Roman world. Soon afterwards,
Antony and Cleopatra ended their lives by suicide.
The son of Antony by Fulvia, and Cæsarion, son of
Cæsar and Cleopatra, were put to death; and in
B. C. 29, after disposing of several affairs in Egypt,

Greece, Syria, and Asia Minor, A. returned to Rome in triumph, and closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favour, he abolished the laws of the triumvirate, adorned the city of Rome, and reformed many abuses. At the end of his seventh consulship (B. C. 27), he proposed to retire from office, in order that the old republican form of government might be re-established, but he was ultimately induced to retain his power. Hitherto, since Cæsar's death, the consul had been named Octavian; but now the title of *Augustus* (meaning 'sacred' or 'consecrated') was conferred on him. In the eleventh consulship of A. (B.C. 23), the tribunitian power was conferred on him for life by the senate. Republican names and forms still remained, but they were mere shadows. A. was in all but name absolute monarch. In 12 B.C., on the death of Lepidus, he had the high title of Pontifex Maximus, or High Priest, bestowed on him. The nation surrendered to him all the power and honour that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, &c., A. (9 B.C.) suffered the greatest defeat he had sustained in the course of his long rule, in the person of Quintilius Varus, whose army was totally destroyed by the Germans.

This loss so afflicted A., that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: 'O Varus, restore me my legions!' From this time A. confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, 'A. found the city built of bricks, and left it built of marble.' He also founded cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the senate, the name Augustus was given to the month Sextilis.

Though surrounded thus with honour and prosperity, A. was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and Marcellus, the son of his sister, and Caius and Lucius, the sons of his daughter, whom he had appointed as his successors and heirs, as well as his favourite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, domestic sorrows, and failing health, warned him to seek rest; and, to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (August 19, A.D. 14), in the seventy-seventh year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: 'Have I played my part well? If so, applaud me!' A. had consummate tact and address as a ruler and politician, and could keep his plans in secrecy while he made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by A. himself. He encouraged agriculture, patronised the arts and literature, and was himself an author; but only a few fragments of his writings have been preserved. Horace, Virgil, and all the most celebrated Latin poets and scholars, were his friends. His was the *Augustan Age* of literature. His death threw a shade of sorrow over the whole Roman world; the bereaved people erected temples and altars to his memory, and numbered him among the gods.

AUGU'STUS, Elector of Saxony (1553-1586), son of Duke Henry the Pious, and of Katherine of Mecklenburg, was born July 31, 1526, at Freiberg, then the seat of his father's court. While still a youth, he spent some time at Prague, and there formed an intimate friendship with Maximilian, King Ferdinand's son, afterwards Emperor of Germany. In 1548 he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and of her domestic worth. After the death of his brother, Maurice, in 1553, A. succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant Church. Equally intolerant and inconsistent in his theology, A. first used his utmost influence in favour of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, however, it must be owned, to his honour, that, by his skilful internal administration, he raised his country far above the level of any other in Germany, introducing valuable reforms both in jurisprudence and finance, and giving a decided impetus to education, agriculture, manufactures, and commerce. He even wrote a book on the management of orchards and gardens, and commanded that every newly-married pair should, within the first year of their marriage, plant two fruit-trees. The Dresden Library owes its origin to him, as do also most of its galleries of art and science. His own favourite private pursuit was that of alchemy, in which the Electress Anna also took a part. In the January of 1586—the electress having died in the previous year—A. married a young princess of Anhalt, but died a month after, and was buried in the cathedral of Freiberg. He was succeeded by his son, Christian I.

AUGU'STUS II., FREDERICK, commonly called the Strong, Elector of Saxony and king of Poland, second son of the elector, John George III., and of the Danish princess, Anna Sophia, was born at Dresden in 1670. His extraordinary strength was developed by a careful physical education, and his mental faculties more successfully cultivated than his morals. From 1687 to 1689 he travelled over the greatest part of Europe, but was prohibited by his father from visiting Rome. Upon his father's death (1691), he went to Vienna, and there formed an intimacy with Joseph, king of Rome, which materially influenced his politics. When, in 1694, he succeeded to his brother George as Elector, instead of turning his arms against France, according to previous arrangement, he undertook the command of the Austro-Saxon army against the Turks in Hungary. After the battle of Olasch, in 1695, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than Prince Conti for the crown (10 million Polish florins), and adopting the Catholic faith, he was elected king by the venal nobles; and having, by his imposing force, awed the adherents of Conti, he was crowned at Cracow, 15th September 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leczynski, and the ignominious peace of Altranstädt in 1706. So complete was his humiliation, that A. was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on receiving intelligence of the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstädt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII. at Friedrichshall, in 1718, gave a new aspect to affairs, leading first to

eventually to a peace with Sweden. a confederation, headed by a Polish been formed against the Saxons, and with much success, till, in 1716, mediation of the czar, a compact was ween the Poles and A., agreeably to which troops left the kingdom. The king now himself obliged to employ conciliation, and the ar of his dissolute court soon won the favour Polish nobles, who followed his example but ely. Saxony had bitter cause to regret the of the crowns. Its resources were shame- ersal, even when want and famine were on the adornment of the capital, on the ses, his illegitimate children, and the no deluded him with hopes of the elixir supported the fine arts as ministering , but did little for the cause of science. n principle, though easy in temper; ambi- well as luxurious; reckless alike in the of war and pleasure, death overtook him in of projected festivities. On his way to r diet, gangrene of an old wound set died in February 1733, and was buried ow. By his wife—a Protestant, and daughter rgrave of Brandenburg-Kulmbach—he son, who succeeded to him. The most of his numerous illegitimate offspring it is affirmed, to somewhere about 300 rice, Count of Saxony.

'US III., FREDERICK, Elector of Saxony Poland, the son and successor of the born in October 1696, and carefully by his mother in the Protestant faith. At of fifteen, however, he left her tutelage for through Germany, France, and Italy, where aged his religion, secretly professing Catho- at Bologna, in 1712, though the fact was icly known in Saxony till five years is possible that an eye to the crown of and to an alliance with one of the Austrian , may have had something to do with After succeeding his father in the ne in 1733, he was chosen king of Poland art of the nobility; and triumphing over al claims of Stanislaus Leszcynski, sup- by Louis XV., was unanimously proclaimed ears later. He inherited his father's sumptu- es, though not his talents; and his , cultivated by his Italian tour, enriched of Dresden with noble paintings. The of his country he made over entirely minister, Count von Bruhl, whose whole l system consisted in complete dependence ussia. In 1742, alarmed at the increased Prussia had obtained by the conquest of A. formed an alliance with Maria Theresa; the secret treaty of Leipsic, contracted to her with 50,000 men. But their united troops mpletely routed by the Prussians in 1745; derick II. pushing on into Saxony, A. had pe from his capital, saving his art-treasures, ving his state-papers in the hands of the or. In 1746, the peace of Dresden restored ony; but the close of the year again saw broiled with Prussia. Joining the camp at he narrowly escaped being taken prisoner, d to flee to Poland, where his popularity, rery great, was much diminished by his reverses in Saxony, added to which the Catharine of Russia used every effort to as being an ally of France. At the the peace of Hubertsburg, A. returned where he died in 1763. His son, n, succeeded him in the electorate, stowski became king of Poland.

AUK (*Alca*), a genus of web-footed birds, the type of a family called *Alcadæ*, which was in great part included in the Linnæan genus *Alca*, and to many of the species of which, now ranked in other genera, the name A. is still popularly extended. The *Alcadæ* are amongst those web-footed birds collectively called *Brachypterra* (i. e., short-winged) or Divers by Cuvier, remarkable for the shortness of their

Great and Little Auks.

wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and compels them, when on land, to maintain an upright attitude. They are distinguished by the very compressed bill, which, in the true auks, is vertically elevated, and so sharp along the ridge as to resemble the blade of a knife; and by their entirely palmated feet, destitute of hind toes. The auks are entirely confined to the seas of the northern hemisphere, the penguins taking their place in the southern, and are most abundant in the colder regions. All of them have a dense plumage, which generally exhibits on its surface a beautifully polished appearance and silvery lustre. The genus *Alca*, as restricted by Cuvier and others, contains only two species, distinguished from the Puffins (q. v.), which also belong to this family, chiefly by the greater length of the bill, and its being covered with feathers as far as the nostrils. The bill, both in the auks and puffins, is transversely and strongly grooved. But even the two known species of the restricted genus *Alca* differ from one another in a most important particular, the wings of the one, the Great A., being so short that it is quite incapable of flight, like the penguins, of which it may be deemed the true northern representative, whilst the other, the Razor-bill, has comparatively long wings, and flies well.—The GREAT A. (*Alca impennis*) is as large as a goose. It is an inhabitant of the most northerly shores, and a very rare visitant of those of the Orkney and Shetland Islands and the Hebrides. It is almost equally rare in Norway and Sweden, and has nearly disappeared even from Iceland and Greenland, and from localities on the coasts of Labrador and Newfoundland, where it is said to have been formerly frequent. The rapidity with which this bird moves under water is extraordinary: one of them has been pursued by a six-oared boat for hours in vain. Like most of the *Alcadæ*, the Great A. lays only one egg, which is very large, about five inches in length, and three in its greatest breadth.

The egg is laid on the bare rock, without any attempt at a nest.—The RAZOR-BILL (q. v.) (*A. Torda*) is the only other species now commonly included in the genus *Alca*.—The name LITTLE A. is often given to a bird also called the ROTCHE (q. v.) (*Mergulus Alle*, formerly *Alca Alle*), common in arctic regions.—The common puffin is sometimes called the Labrador Auk.—The northern parts of the Pacific Ocean abound in auks remarkable for a somewhat quadrangular bill, notched near the tip, which form the genus *Phaleris*. One of them, *P. psittacula*, is known as the Parrakeet Auk.—All the auks feed upon fishes, crustaceans and other marine animals, which they pursue under water, and for which they dive to great depths.

AU'LIC COUNCIL (Lat. *aula*, court or hall), one of the two highest courts of the old German empire, co-ordinate with the Imperial Chamber. It came into existence in 1495, and seems to have been at first employed principally in preparing business-matters regarding the crown-lands and the empire generally, in order to expedite the decisions of the Imperial Chamber. It soon, however, began to assume or acquire higher functions. After 1502, the States submitted important grievances to its independent consideration; but it did not receive a fixed constitution before 1559. In 1654, it was formally recognised as the second of the two supreme courts, and equal in dignity to the Imperial Chamber. It was composed of a president, a vice-president, a vice-chancellor, and eighteen councillors, who were all chosen and paid by the emperor, with the exception of the vice-chancellor, who was appointed by the Elector of Mainz. Of the eighteen councillors, six were Protestants, whose votes, when they were unanimous, could not be set aside by those of the others, so that a religious parity was to some extent preserved. The councillors were divided into three classes—counts, barons, and men of learning—all of whom were on a footing of equality, except that the last mentioned received a higher salary, and were usually advanced into the ranks of the nobility. The Council held aloof from politics, but under its jurisdiction were placed: 1st, All matters of feudality in which the emperor was immediately concerned; 2d, All questions of appeal on the part of the States from decisions in favour of the emperor in minor courts; 3d, Whatever concerned the imperial jurisdiction in Italy. On the death of the emperor, the Council was dissolved, and had to be reconstructed by his successor. It finally ceased to exist on the extinction of the old German empire in 1806.

AUMALE, CHARLES DE LORRAINE, DUC D', born 1554, was an ardent partisan of the League in the politico-religious wars which devastated France in the latter half of the 16th c. The aim of the League was ostensibly to suppress the Huguenots, but in reality to secure the supreme power to the Guises. Closely allied by blood to this crafty and ambitious family, A. from the very first entered with fanatical sympathy into its schemes; and after the murder of the Duke of Guise at Blois in December 1588, he became, along with the Duke of Mayenne, the leader of the party. In 1589, he seized Paris, dissolved the parliament, and imprisoned its members. Shortly after, he put himself at the head of a body of troops to attack the town of Senlis, but was defeated by La Noue, and compelled to retreat. Always unfortunate in war, his presence seemed invariably to insure the overthrow of his friends. He commanded a portion of the forces of the League at the battles of Arques and Ivri, where the Huguenots triumphed under their skilful and sagacious monarch, Henry IV. But A. was as obstinate as he was unlucky, and in the end proved himself as traitorous as he was obstinate. He held out for the League in Amiens until the populace expelled him, when he suddenly allied himself with the Spaniards who had invaded Picardy, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel. His property was confiscated, but he himself escaped. He lived in exile till his death, which took place at Brussels in 1631. He left no male posterity.

AUMALE, HENRI-EUGENE-PHILIPPE, LOUIS D'ORLÉANS, DUC D', born at Paris, January 16, 1822, is the fourth son of the late king of France, Louis Philippe. He enjoyed the privilege—so rare among princes—of being educated along with his fellow-men, at the college of Henri IV., where he exhibited considerable talent, and obtained several honours. When 16 years of age, he entered the army, soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. In 1843, he embarked at Brest for Algeria, where he commanded a subdivision of the French army, and performed some brilliant exploits, the most signal of which was his surprising Abd-el-Kader, when encamped in the environs of Goudjilah. By this *coup de main*, which occurred on the 16th of May 1843, there fell into his hands a multitude of cattle, 4 standards, 3600 prisoners, and the correspondence and treasure of the Emir. He was, in consequence, elevated to the rank of lieutenant-general, and appointed to the government of the province of Constantine. In 1847 he succeeded Marshal Bugeaud in the governor-generalship of Algeria. While holding this high office, he was exposed to a series of bitter attacks by the Democratic 'opposition' in the Chamber of Deputies, but was ably defended by Guizot. After the expulsion of his father, he withdrew from Algeria, having first, with self-denying patriotism, exhorted the colony peaceably to obey the orders of the metropolis. He then resided in England till 1871, when he returned to France, and became President of the Council-general of the Oise. He has written two remarkable articles in the *Revue des Deux Mondes*—one on the *Zouaves*, and another on the *Chasseurs-à-pied*. He has also composed a *Histoire des Condés*, and several other works.

AUNE, the French cloth-measure corresponding to the English *ell*. Both words are derived from the Lat. *ulna*. The English ell = 1¼ yard = 45 inches; the French *aune usuelle* (or *nouvelle*) = 1¼ mètre = 47¼ inches English. The old *aune* was a little shorter.

AUNOY, MARIE-CATHERINE-JUMELLE DE BERNEVILLE, COMTESSE D', a celebrated French authoress of the reign of Louis XIV. She was born about 1650, and died at Paris, January 1705. She composed fairy tales, romances, and historical memoirs. Among her fairy tales may be mentioned, *The Yellow Dwarf*, *The White Cat*, and *Cherry and Fair Star*. Many of these fictions have been translated into English, and are greedily read by school-boys. They have, both in France and other countries, gone through numerous editions, and are the sole monuments of her fame; for her sentimental novels, *Hippolyte*, and *Comte de Duglas*, have long ago vanished from the eyes of men; while her historical memoirs are not regarded as in the slightest degree trustworthy.

AURANTIA'CEÆ (from *aurantium*, modern Latin for an orange), a natural order of exogenous plants, consisting of trees and shrubs, often of great beauty. Both leaves and bark are generally very smooth, and all parts are filled with little transparent receptacles of a fragrant volatile oil, which especially abounds in the leaves and in the rind of

LIA. See CHRYSALIS.

ELIA'NUS, LUCIUS DOMITIUS—also named
ius DOMITIUS and VALERIUS—one of the most
ful of the Roman emperors, was of very
e origin, his father having been a husbandman.
s born about A.D. 212, and enlisting early as
mon soldier, he rapidly distinguished himself,
eld the highest military offices under Vale-
and Claudius II. On the death of Claudius
270), A. was elected emperor by the army.
mmenced his reign by vigorous opposition to
rbarian Alemanni, or Marcomanni, whom he
d. Thereafter, he commenced the erection
new line of fortified walls round Rome,
were not completed till the reign of Probus
276). Their ruins still mark the boun-
of Rome in the time of Aurelian. Finding
he province of Dacia (now Wallachia) could
e maintained against the assaults of the
he surrendered it, on certain conditions, and
hened the frontier of the Roman empire by
g the Danube its boundary. He next turned
tention to the East, where the renowned
Zenobia (q. v.), had extended her sway from
o Asia Minor and Egypt. A. defeated her in
two battles, and besieged her in Palmyra, from which she attempted to escape, when she saw defence would prove unavailing. She was, however, taken prisoner, and soon after the city surrendered, and was treated leniently. Shortly after A. had departed, a new insurrection took place. He returned, in 273, and gave the splendid city up to destruction. A. was again called to the East by a rebellion in Egypt, instigated by Firmus, a merchant of great influence, which he speedily quelled. Besides, Tetricus, who had held imperial power in Gaul since before the death of Gallienus, finding himself unable to wield it, surrendered it to Aurelian. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, A. merited the title awarded to him by the senate—'Restorer of the Roman Empire.' He fell a victim to conspiracy during his campaign against the Persians (A.D. 276).

AURE'LIUS, MARCUS. See ANTONINUS.

AURICLES, two cavities of the heart. See HEART.

AURICULA (*Primula Auricula*), a plant of the same genus with the Primrose (q. v.), much cultivated in flower-gardens. The A. has long been a florist's flower. It was highly esteemed by the Romans, and has, at least since the beginning of the 18th c., received particular attention from the florists of England and Holland. It is one of those flowers, the cultivation of which is often most successfully

Auricula (wild state).

prosecuted in the little gardens of operatives near large towns. Lancashire is particularly famous for it.—The A. has smooth, dark-green leaves, scapes (or leafless stems), and calices, covered with a mealy powder. A similar fine meal appears also on the flowers, and adds much to their beauty. The A. is a native of the Alps and other mountains of the middle and south of Europe, and of sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria; it grows in shady and moist places. In a wild state, it has comparatively small flowers, of a simple yellow colour, on short stalks, forming an umbel of generally six or seven on one scape, with the

same delightful fragrance which aids so much to make it a favourite flower in cultivation. The leaves are used by the inhabitants of the Alps as a remedy for coughs.

By cultivation and art, the A. has been brought to great beauty and splendour of colour. Red, pink, crimson, apple-green, and mulberry are the chief colours which the different varieties exhibit. More than 1200 varieties have been reckoned, and new ones are continually raised from seed. Some of them are entirely of one colour, others of two or more; some are delicately shaded, and some variegated. The mere colour of an A. is not of so much consequence, in the eye of a florist, as the form and shading. The chief requisites of a good A. are large flowers, so many of them on one scape as to give fulness to the umbel, the flower-stalks so strong that the flowers do not hang down; the scape itself must be so tall, that the umbel of flowers may rise completely above the leaves, and so strong as to bear it erect; the flower must be nearly round; the white or yellow eye in its centre must be distinct and round, its colour not mixing with the ground colour, which, however, may mix at the outer part with the green of the margin. The green margin adds much to the beauty of many varieties. The mealiness of the flower differs much in different varieties.—The A. blooms in April and May, and often also a second time in the end of autumn, which adds to the charms of the flower-border, although it is to the first or proper flowering-season that the florist looks. It succeeds best in a rich light soil, and cultivators diligently prepare for it composts of various kinds, but in general consisting chiefly of fresh loamy soil, and of well-rotted horse or cow dung, often with the addition of a little sand. The finer varieties are always cultivated in pots, and require great attention. They are protected from the severe weather of winter, and during the flowering-season, from wind and rain. They ought, however, previous to flowering, to stand in an airy, sunny situation. Their delicacy forms a striking contrast to the natural hardiness of the plant; but few sights are more pleasing than that of a collection of choice auriculas, tastefully arranged. They are propagated by offsets, generally in the latter part of August.—When it is proposed to raise the A. from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air, hand-glasses being placed over them during heavy rains. The seed is sown either in autumn or spring, generally in boxes placed under shelter, or in a slight hot-bed. The more weakly plants are tended with particular care, as they are generally found to produce the finest flowers.

The name A., originally Latin, is derived from *auris*, an ear, on account of a fancied resemblance of the leaves to the ears of an animal.

AURICULA, a genus, and AURICULIDÆ, a family of Gastropod Mollusca. They have a spiral shell,

Auricula.

covered with a horny epidermis, the first whirl very large and the spire short, the aperture elongated and toothed. They belong to that section of Gastropods in which the sexes are united in the indivi and to the same order with the common s having respiratory organs adapted for breathi air, although some of them are capable of subs for a considerable time in water. Some of inhabit fresh-water marshes, and others p vicinity of salt water. They generally b warm climates, and some of them attain a l *Auricula Midæ*, a native of the East Indies, is k to shell-collectors by the name of Midas's Ear.

AURI'CULAR CONFESSION. See

AURI'CULATE, in Botany, a term appoe leaves, stipules, &c., and signifying that they h at the base two small ear-like lobes.

AURILLAC, a town of France, capital of department of Cantal (Auvergne). A. is situated pleasant valley on the banks of the Jourdanne, a 269 miles south from Paris. It is said to owe origin to a Benedictine monastery founded in 9th c. by St Gerard. The English, in the 14th 15th centuries, often besieged the town, and it frequently taken and pillaged during the religious w in France in the 16th c. The streets are wide, irregular, and are kept clean by streams supplied a reservoir above the town and by a canal from Jourdanne. The neighbouring quarries supply sl to cover the houses. The principal buildings of are the churches of Notre Dame and St Gerard Stephen's Castle, the theatre, college which contain a valuable public library. corn-market. There is also a monument the memory of the French philanthropist, M. Montyon. Paper, jewellery, lace, copper utens leather, and beer are the chief industrial produc Pope Sylvester II. was born at A., and the infam Carrier of the first French revolution. Pop. (1 11,098.

AURO'RA (styled *Eös* by the Greeks), the g dess of the dawn, or 'morning redness,' wa daughter of Hyperion and Theia, and sister of He and Selene, and wife of the Titan Astræus. Zephyr Boreas, Notus, Hesperus and the other w her children. She was described as morning from her bed in the ocean, b a chariot drawn by the divine steeds Phaëton, ascending heaven from the river O where she lifted with her 'rosy fingers' the c of night, and announced the light both to gods men. Homer frequently describes A. as the go of day, and the tragic writers identified A. w *Hemera* (the day). She was represented as clad in a rosy-yellow robe, with a star shi forehead, and a torch in her right hand. passion for mortal youths, and carried Cleitus, and Tithonus.

AURO'RA BOREA'LIS, or NORTHE LIGHTS (Ger. *Nordlicht*), the name given luminous phenomenon which is seen towa north of the heavens by the inhabitants of the latitudes. During the winter of the northern sphere, the inhabitants of the arctic zone the light of the sun for months togeth long dreary night is relieved by the li beautiful meteor, which occurs with grea in these regions. Those who have e southern seas have seen the same direction of the south pole, so t Lights might be more appro Lights to designate the aur the A. B. has been describe observers, both in Northern and Ce of whom give substantially the same acc manner in which the phenomenon takes briefly as follows: A dingy aspect of direction of the north is genera

aurora; and this gradually becomes darker in
r, and assumes the form of a circular segment
ed by a luminous arch, and resting at each
the horizon. This *dark segment*, as it is
...as the appearance of a thick cloud, and is
n as such in the fading twilight before
...nt of the auroral light. Its density

to one situated not so far south, it would
as a larger and higher arch; to one placed
below it, it would be seen as an arch passing through the zenith; and to one situated within the ring and further north, it would be found as an arch culminating in the south. On this supposition, nearly all the various positions of the auroral arch may be accounted for. The centre of the ring corresponds probably with the magnetic north, which is at present situated in the island of Boothia Felix. Hence it is that in Greenland, which is situated to the east of this island, the auroral arch has been seen stretching from north to south with its highest point in the west. The luminous arch, once formed, remains visible for several hours, and is in a constant state of motion. It rises and falls, extends towards the east and towards the west, and breaks sometimes in one part, sometimes in another. These motions become all the more observable when the arch is about to shoot forth *rays;* then it becomes luminous at one point, eats in upon the dark segment, and a ray of similar brightness to the arch mounts with the rapidity of lightning towards the zenith. The ray seldom keeps the same form for any length of time;

Aurora Borealis.

undergoes continual changes, moving eastward
westward, and fluttering like a ribbon agitated

what south-east of the zenith. There they
what is called the *Boreal Crown;* and the whole
ns, towards the east, west, and north, present
the appearance of a vast cupola of fire, supported by columns of variously coloured light. When the rays are darted less brilliantly, the crown first disappears, then, here and there, the light becomes faint and intermittent, till at last the whole phenomenon fades from the sky.

The preceding description indicates the general features of the appearance of the A. B.; but several auroras have been described which presented striking peculiarities. Sometimes the phenomenon assumed the form of one or more curtains of light, depending from dingy clouds, whose folds were agitated to and fro, as if by the wind. Sometimes this curtain seemed to consist of separate ribbons of light, arranged side by side in groups of different lengths, and attaining their greatest brilliancy at the lower edges. In this country the A. B. seldom occurs with the distinctness and brilliancy which attend it in northern latitudes, but the description just given portrays the type to which such appearance of the meteor more or less approximates.

The height of the aurora has been variously

estimated. The first observers were inclined to place the seat of it beyond the atmosphere; but this hypothesis is untenable, as the aurora does not seem to be affected by the rotation of the earth, but appears to be in every respect a terrestrial phenomenon. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, heights varying from 5 to 500 miles have been calculated. The cause of these widely differing results may be found in the probability that exists of each observer seeing a different arch of the aurora for himself, and he is, in consequence, furnished with no comparable or reliable data for his calculations. It is now, however, generally admitted, on what are considered to be sufficient grounds, that the A. B. occurs at various heights, and that it is seldom found beyond ninety miles above the surface of the earth. The distance of the stations at which the same aurora has been visible, indicates the enormous geographical extent, and likewise the great altitude which the phenomenon frequently attains. One aurora, for instance—that which occurred on the 3d of September 1839—was seen in the Isle of Skye by M. de Saussure; at Paris, by the astronomers of the Observatory; at Asti, in the Sardinian states, by M. Quetelet; at Newhaven, in Connecticut, by Mr Herrick; and at New Orleans, by credible observers. On the other hand, some observers of eminence assert that the aurora sometimes descends to the region of the clouds, and appears almost as a local phenomenon. A brilliant aurora was seen by Mr Farquharson, the minister of Alford, in Aberdeenshire, on the 20th of December 1829, from eight to half-past eleven in the evening, above a thick bank of clouds, which covered the tops of the hills to the north of where he lived, and which never attained an altitude of more than 20°. The same aurora was seen in the zenith, at a quarter-past nine, by Mr Paul, another minister, at Tullynessle, which is about two miles north of Alford, so that the height of it could not have been quite 4000 feet.

The noise that is alleged to accompany the A. B. in high latitudes would indicate for it a comparatively moderate height. Some of those who have heard it, compare it to the noise that is produced by the rolling of one piece of silk upon another; and others, to the sound of the wind blowing against the flame of a candle. In Siberia, it has been related that this noise sometimes resembles that attending the discharge of fireworks; and that the dogs of the hunters, when overtaken by such an aurora, lay themselves with terror on the ground.*

The intimate connection between the A. B. and the magnetism of the earth is shewn by various facts. During the occurrence of the phenomenon, the magnetic needle appears very much disturbed, sometimes deviating several degrees from its normal position, and appearing to be most affected when the aurora is brightest; and this oscillation is frequently perceived far beyond the district where the aurora is seen. The vertex, likewise, of the luminous arch is almost always found to be in or very near the magnetic meridian, and the boreal crown has its seat in the prolongation of the freely suspended needle. There seems, moreover, to be a connection between the magnetic poles of the earth in regard to the aurora, for, so far as has been ascertained, the meteor occurs simultaneously at both. The A. B. appears to be an electric discharge connected with magnetic disturbance. This is pretty well established by the great resemblance which the l attending the passage of electricity through ve from which the air has been exhausted bears to aurora. If one of Gassiot's vacuous tubes be brou near an electric machine, or between the pole an induction coil, flashes of light pass between ends, which bear a striking resemblance to aurora borealis. A comparison of the spectra the two goes far to establish identity. The aur spectral line, according to Angstrom, is a yel line near the sodium line, and is the same as air line seen in the solar light when the sun is n the horizon. Other lines, however, have been s by different observers, which cannot as yet produced by the physicist from any known s stance.

* Arctic voyagers, such as Parry and Franklin, throw doubt on the existence of any such noise, for not one of the numerous and brilliant auroras seen by them was ever attended with the faintest sound.

AURUNGABAD, or *Throne-town*, the name at least four places in India. The most import is in the territory of the Nizam, situated on Doolna, a tributary of the Godavery. Its lat. 19° 51′ N., and long. 75° 21′ E. It is one of the stati of the Nizam's army. In 1825, its population w estimated at 60,000—a number supposed to ha since then considerably diminished. Its ruins of former grandeur are a palace, built by and the mausoleum of Aurungzebe's da former is now in ruins; and the latter, he ing some resemblance to the Taj Maha greatly inferior.

AURUNGZEBE (properly, Aurangzīb, ' ment of the Throne') was the most powerful Great Moguls, the last who ruled with energy effect. He was born on the 22d October 1618, was ten years old when, his grandfather dying, father, Shah-Jehan, ascended the throne. A. aspired to wield the rod of empire, but he craf hid his designs beneath the cloak of piety.

Aurungzebe.—From a Native Drawing.

1657, his father, who had previously promoted to high civil and military offices in the state, in forming the duties of which he greatly distin himself, was seized with an illness fr wh was not expected to recover. The reins of were at once seized by his eldest son, treated his brothers very arbitrarily— that time being governor of Bengal, A. of the and Mūrad of Guzerat. The first imm took up arms. A.'s policy was to let the it out, and exhaust each other, and then t his third brother against the victor. He with Mūrad; assured him he had no eart tion; that the crown he strived for was a

emporal one; and that, for affection's sake, view to promote the interests of the true a was liberal in his religious opinions, and n a look to prove that Mohammed and greed in all essential points—he would is pretensions to the throne. Murad m, and the forces of the two were joined. , Dara having overcome Shuja's army, s forces against his other two brothers; lausibility prevailed over Dara's generals, d, and Dara had to seek safety in flight. me, however, Shahdehan had somewhat

A. professed the utmost loyalty, but ve his commissions to take possession han's palace, which was done, and the rch was made prisoner. A. next seized d his two remaining brother, Murad; and ruggle of two or three years' duration. Shuja also fell into his power, and all put to death. The sceptre was now firmly grasp of Aurungzebe. He professed not the imperial insignia, but was ultimately receive them on August 2, 1678. He, at time, assumed the presumptuous title of Conqueror of the World.' He also took Mohi-eddin, 'the Reviver of Religion.' In h year of A.'s reign, his father died, at a ge; but there are suspicions, nevertheless, ath was hastened by slow poison, administ command of his son.

; reign of half a century was distinguished outward prosperity, but the empire was t its heart. Everywhere there was dis who had established his empire by fraud, dly enough distrusted by all. He lacked in his statesmen, who, in their turn, dis n and one another. His sons imitated disobedience to his father, and the Hin he treated with great harshness, excited ttas against him in the south. Still his ties sufficed during his reign not only to s empire intact, but even to enlarge it ly. Discord between the monarchs of ul Golconda, which was mainly due to when acting as governor of the Deccan, ma to add these two kingdoms to his but the seeds of decay which had been s reign bore ample fruit in the reign of The decadence of the Mogul empire dates death, which took place at Ahmednugur, t February 1707, in the eighty-ninth year and fiftieth of his reign. The latter years were passed in misery. The memory of imes weighed heavy on his soul. He lived t dread that he himself would receive of e which he had meted out to others. His remarkable among Oriental courts for its ad freedom from ostentation. A.'s character without its good features, as instanced , that in the third year of his reign, when a great famine in the land, he gave unsparing e funds of his treasury, which had been rmented by his frugality, to procure food ple.

'LTATION (Lat. *auscul'to*, to listen), a detecting disease, especially those of the lungs, by listening to the sounds produced ity of the chest. This is done either by ted ear (*Immediate* A.), or by the aid of a nd-conveying instrument, the stethoscope *diate* A.). By care and attention, the unds produced by respiration and the the heart may be distinguished from the normal sounds indicating disease. A. is mong the most important of discoveries medical science. Its details are ably explained by the discoverer, Laënnec. See PERCUSSION.

AUSONIUS, DECIUS MAGNUS, the most conspicuous Roman poet in the 4th c. after Christ, was born at Burdegala (Bordeaux), about 309 A.D. Scaliger asserts that his father, Julius A., was the favourite physician of the Emperor Valentinian, but the assertion has no historic basis, so far as we know. He was, however, a man of considerable importance, having been at one time honorary prefect of Illyricum, and he appears to have taken care that the young A. should receive an excellent education. Many amiable female relatives fostered, and probably flattered the talents of the boy. After finishing his curriculum at Toulouse, he returned to Bordeaux, where, after practising for a short time at the bar, he turned his attention to literature, and soon distinguished himself as a professor of oratory. Some years later, he was appointed by Valentinian tutor to his son Gratian; afterwards quæstor, and, by Gratian, prefect of Latium, and subsequently consul of Gaul (379 A.D.). On the death of Gratian, A. retired from public life to his estate at Bordeaux, where he occupied himself with literature and rural pursuits until the time of his death (392 A.D.). The question whether or not A. was a 'Christian,' has occasioned much controversy, and remains yet unsettled. His works include translations of Greek eclogues, a collection of 150 epigrams, epistles in verse and prose, 20 so-called idyls and other descriptive pieces, which, though admired in their day, are generally worthless, and bear all the marks of the corrupted taste prevalent in literature during his time. But though destitute of every true poetic quality, A. occasionally displays a certain neatness and grace of expression, which shew that, in a better era, he might have proved a greater poet. Besides these, he also wrote a panegyric on the Emperor Gratian, full of bombastic phrases and fulsome adulation. Editions of his writings have been given by Scaliger (Leyden, 1575), Tollius (Amsterdam, 1669–1671), and Souchay (Paris, 1730).

AUSTEN, JANE, a novelist of deservedly high reputation. Her father was rector of Steventon, Hampshire, at which place his daughter was born, December 16, 1775. Mr Austen, who was himself a gentleman of some literary attainments, bestowed on his daughter an education superior to that usually given to young ladies in her sphere of life in the end of last century. Jane was distinguished alike by good sense, sweetness of disposition, and personal attractions. Her novels, which are rather limited in subject, are remarkable for the truthfulness with which they portray the everyday life of the middle classes of England in her time, and for their delicate, yet withal distinct discrimination of the various shades and peculiarities of character. Sir Walter Scott said of her: 'That young lady had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with. The big bow-wow I can do myself like any one going; but the exquisite touch, which renders common-place things and characters interesting from the truth of the description and the sentiment, is denied to me.' Miss A.'s first four novels—*Sense and Sensibility*, *Pride and Prejudice*, *Mansfield Park*, and *Emma*—were published anonymously between 1811 and 1816. *Northanger Abbey* and *Persuasion* followed, with her name on the title-page, in 1818, after her death, which took place at Winchester, July 24, 1817.

AUSTEN, WILLIAM, an English metal-worker and designer of the 15th c., celebrated as the constructor of the famous tomb of Richard de

Beauchamp, Earl of Warwick, in St Mary's Church, Warwickshire. Men of taste and judgment have not hesitated to put his works on an equality with those of Italian artists of the same period.

AU'STERLITZ, a small town in Moravia, about 12 miles east-south-east from the town of Brünn, stands on the Littawa, and has a population of 2400. A. has a handsome palace; but it is celebrated chiefly as the place where Napoleon I., in December 1805, defeated the combined forces of Austria and Russia, under the command of their respective emperors. After the capitulation of Mack, at Ulm, October 17, Napoleon had marched on without opposition to Vienna, of which he took possession, November 11, 1805. The Russian and Austrian forces had retreated to Moravia, and Napoleon had fixed his head-quarters at Brünn. Towards this locality the troops of Alexander and Francis marched in five parallel columns to offer battle. The movements of the allies were ill-conducted, and evidently made without a due knowledge of the strength of the French army, which was concealed by the tactics of Napoleon. It amounted to about 80,000 men; while the allied armies numbered 84,000, of which 16,000 were cavalry. The battle commenced at seven, on the morning of December 2, and the Russian line was soon broken. The left wing of the allies suffered severely towards the close of the engagement, and endeavoured to save themselves by crossing a frozen lake; but Napoleon ordered his artillery to play upon the ice, which was broken up, and about 2000 perished in the water. According to Alison, the allies lost 30,000 in killed, wounded, and prisoners, and the French 12,000. Russian and French accounts make their respective losses smaller. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on the 26th of December, by the treaty of Presburg, which determined that Austria should surrender the Venetian territories, and also her possessions in Swabia and the Tyrol.

AU'STIN, the capital of Texas since 1844, is situated on the left bank of the Colorado, in lat. 30° 15′ N., long. 97° 47′ W., at a distance of 200 miles from its mouth. In the season of high-water—that is, in the winter—A. is accessible to steam-boats from the sea. Population, in 1853, estimated at 3000.

AUSTRALA'SIA, a term etymologically equivalent to *Southern Asia*, but according to usage different. While *Southern Asia* vaguely means the lower regions of that continent, A. definitely indicates those large, or comparatively large, islands which, lying between the Malayan or Indian Archipelago and Polynesia Proper, are at once rounded off in collective position from the former, and distinguished in individual magnitude from the latter. The islands in question are chiefly Papua or New Guinea, Australia, Tasmania, New Zealand, New Caledonia, New Hebrides, New Ireland, and New Britain—all to be again noticed in their places. Though the name is not in general use, yet it seems necessary, to a satisfactory system of geographical classification. In its entire extent, A. cannot be much less than Europe.

AUSTRA'LIA, the south-west division of Australasia. By some, it is strictly defined to be an island—as, indeed, may either of the masses of land called the Old and the New Worlds—while by others it is loosely described as a continent. It is bounded on the W. by the Indian Ocean; on the N., by Torres Strait; on the E., by the Pacific; and on the S., by Bass's Strait. It extends in S. lat. from 10° to 39°, and in E. long. from 113° to 154°; while its longest dimensions, as incidentally noticed under the h of AMERICA, may be said to run respectively a meridian and a parallel. The parallel in question is that of about 25°, nearly the mean lat. of A.; and the meridian is that of 142° or 143°, nearly the mean long. of Australasia—a meridian, too, which, when produced in either direction, seems to mark out both Tasmania and Papua as geological continuations of Australia. In English measure, the greatest breadth from north to south is upwards of 2000; and the greatest length from east to west nearly 2600 miles. Of the resulting rectangle of 5,200,000 square miles, A. comprises more than a half, perhaps four-sevenths, or, in all, about 2,970,000 square miles—half the area of South America, as the next larger continent, or ten times that of Borneo, as the next smaller island.

In the mutual relations of itself and the ocean—a point of vast importance to so large a mass of land—A. is decidedly inferior to every one of the grand divisions of the globe. It is not indented by the sea, as is North America on the east, or Asia on the east and south, or Europe on all sides but one. Again, as to navigable channels between the coast and the interior, A. is not to be compared even to Africa with its Nile and its Zambesi, its Niger and its Congo, its Gambia and its Senegal, and its many smaller arteries of communication besides.

Among the indentations of the coast, the Gulf of Carpentaria, on the north-east, the only one of considerable magnitude, does, it is true, penetrate inwards about 500 miles from Cape York on the east, and about 400 from Cape Arnhem on the This opening is entirely surrounded by ... regions, rendered suitable for colo... frequent and moderate rains. sending off branch after branch to lose themselves in landlocked lagoons. Nor is its growth less curious than its lower channel. The whole of the interior drainage of the maritime ridge of New South Wales between lat. 25° and lat. 34°, a stretch of about 625 miles, converges into a vast basin of clay, on the 30th parallel, where the Balonne, Dumaresque, Gwydir, Namoi, Castlereagh, Macquarie, and Bogan, after spreading out in spacious marshes, and amid complicated junctions and bifurcations, unite such surpluses as absorption and evaporation may have left them to form the 'mysterious' Darling.

Such being the hydrography of A., the investigation of the interior, so far as it has hitherto advanced, has been conducted almost entirely by land. In 1844, Sturt penetrated to the centre of the country, between Spencer Gulf on the south, and the Gulf of Carpentaria on the north, meeting sterility and drought. In 1847, Leichhardt, encouraged by the success of his previous expedition from Sydney to Port Essington, started from Moreton Bay on the east, for Western A., following a sort of diagonal of nearly the greatest possible length; and, as was to be dreaded, he must have failed in his bold enterprise; for neither of himself nor of his companions has any intelligence ever been received. Subsequent explorations made by Stuart (1858–1862), Burke and Wills (1860–1861), and by expeditions in search of them, have resulted in the discovery that this interior of the Australian continent is, on the whole, well fitted for pastoral, and in many places, for agricultural purposes. See AUSTRALIAN EXPLORATIONS in SUPP.

Any detailed view of the climate, besides being equally difficult and unsatisfactory with respect to so vast an aggregate of latitudes and longitudes, has been rendered comparatively unnecessary by the incidental allusions to the subject in the preceding paragraphs. The following are tabular statements, extracted from local publications:

MEAN ANNUAL RAINFALL.

Locality.	Latitude.	Rainfall.
Brisbane, Queensland, lately Moreton Bay,	27° 1′	35·92 in.
Port Macquarie, New South Wales,	31° 25′	70·79 „
Sydney, New South Wales,	33° 51′	49·00 „
Port Phillip, Victoria Colony,	38° 18′	29·16 „
Lake Alexandrina, Mouth of the Murray,	35°	17·45 „
Adelaide, South Australia,	34° 55′	19·90 „
York, West Australia,	31 53′	25·39 „

FREQUENCY OF RAINY DAYS.

Month.	Adelaide.	Port Phillip.	Sydney, South Head.	Port Macquarie.
January,	4	6	13	11
February,	4	5	12	11
March,	5	7	13	12
April,	10	11	12	12
May,	10	13	12	11
June,	11	11	12	9
July,	14	12	13	9
August,	15	14	11	8

November,	6	10	11	9
December,	5	7	11	9
Whole Year,	105	120	143	120

The mean temperature of Melbourne is 59°, being about 9 higher than that of London. The warmest month is January, the mean of which is 68°; the coldest is July, 49·34. The corresponding temperatures of London are 63 and 36°.

Geology.—The little that is yet known of geology of A. has been chiefly obtained from o sional notes scattered through the journals of sc tific travellers. So utterly unknown were the min treasures of this continent, that it was only com ratively lately, and by the merest accident, that Burra Burra copper-mines were discovered. In 1 farmers were turning up with the plough the a ferous alluvium; pebbles of gold-bearing quartz w used for garden-walks; and we have heard of Oxford graduate who ornamented his garden-wa by building into them masses of white quartz var gated with portions of the unrecognised yellow met In 1846, when Count Strelecki submitted to Sir R Murchison a series of rock and mineral specime gathered in Southern A., the practised eye of th veteran in geology recognised in them a remarkab resemblance to the rocks in the auriferous distr of the Ural Mountains, which he had thoroughly explored. He could not ascertain that gold had ev been found in the colony, but so certain was he th the precious metal existed, that he printed and cir lated amongst the miners of Cornwall a paper urgi them to emigrate to New South Wales, and se there for gold, as they had been accustomed to se for tin and zinc among the alluvial débris of th own hills. After a few years, in the researches Mr Hargreaves, and the diggings that followed, t remarkable prediction was fulfilled to an extent th could not have been anticipated. This narrative of much value, as shewing that geology is no loo in the hands of empirics; that its truths have b so gathered and arranged as to afford bases for s inductions; and that, when rightly used, this scie is of the first importance, even when tested by utilitarian *Cui bono?* of the age. Recognising t the colonial governments of A. have appointed st geologists, who have begun their examination of Australian continent, and a few reports on circu scribed districts have been published.

In looking at the continent as a whole, it require not many broad touches to convey all tha at present known. An immense, roughly quadr gular and comparatively flat district in Central extending from the southern shores in lat. 35° where it forms a coast-line of somewhat bold to 18° S. lat., and having for its eastern and west limits 124° and 138° E. long., is composed of *Ter* rocks. The superficial characteristics of this almost unpeopled tract have already been descri Nothing more is known regarding its struct Three other patches of Tertiary rocks exist. largest is a broadish tract, which forms the coas Western A. northwards from the colony of Po as far as the Tropic of Capricorn. The second o pies a considerable portion of the valley of Murray River, in that district known as Lower L ling. The last and smallest patch covers southern slope of the Australian Alps, extend along the shore from Wilson's Promontory to t Howe.

The immense central expanse of Tertiary l is surrounded by a continuous belt of *Plutonic Metamorphic rocks*, only broken on the south shores, where it forms the coast-line, and where sea has indented it, forming a bay which has for boundaries the more enduring primitive rocks. crystalline belt is, on its east, north, and west sides, separated from the sea by a tract of land ha a nearly equal breadth of 100 miles thro its course. Tracing this from its southern tion in Western A., we find a limited p palæozoic rocks occupying the coloniza around Perth, and containing valuable c Northwards, as already indicated, consists of Tertiary rocks. & 23½° S., the rocks along the whole western and
hern shores are composed of Secondary strata.
he eastern shore, from Cape York to the western
ndary of Victoria, the formations belong to one
ther of the Primary series. Through the whole
st of this boundary tract, whether consisting
ertiary, Secondary, or Primary strata, numerous
often extensive patches of igneous rocks exist
h have been erupted during the Tertiary or
-tertiary epochs.
bout 100 miles from the bounding tract of
asic rocks on the eastern limits of A., and
ing parallel with it, there is an equally broad
of similar strata extending from the shores
e Gulf of Carpentaria to Bass's Strait. These
regions, which unite together and are largely
loped in the southern portion of Victoria,
ly the great store of Australian mineral wealth.
veins which intersect these strata were the
al matrices of the *gold*. It has not, to any
nt, been sought for in this, its original position,
a belief that the amount of metal decreases as
escend in the solid rock. Mr Selwyn, colonial
gist for Victoria, has, however, lately reported
rour of quarrying for the gold in the solid rock.
greatest amount of gold is found in the heaps of
s or old alluvium derived from the denudation
old slaty rocks. The auriferous rocks of
A. are Lower Silurian, as shewn by Messrs
ore and Salter, from the examination of
mens of pentameri, trilobites, and corals from the
s which overlie them. Mr Selwyn has referred
Victoria gold-bearing strata to the same age,
the occurrence in them of about 60 species
wer Silurian fossils, including trilobites, grapto-
and lingulæ. The auriferous quartzose veins
t abundant in the vicinity of eruptive rocks,
r granite, porphyry, or greenstone.
ore Selwyn and Rosales have shewn that the
ficial drifts containing the gold consist of three
ict stages. The lowest or oldest contains the
ns of wood and seed-vessels differing little
the present vegetation; among them the cones
nkasia, an exclusively Australian genus, have
identified. The remains of animals exhibit also
presentatives of the living fauna of the country.
the marsupials then existed - kangaroos, poto-
and wombats - representing the elephants, and
the large carnivora of Asia; but with the
tion of the mastodon, of which one species
een found in A., there were, it would seem, no
ic forms common to this great district and
st of the land in the eastern hemisphere. In
ria, these beds of alluvium have been over-
l and even interlaced by basaltic *coulées*, which
ntly proceeded from terrestrial volcanoes, inas-
as the vegetable matter beneath them has
charred and destroyed *in situ* by the eruption.
extensive *coal-field* has been known for some
as occupying the whole of the great basin of
lunter River and its tributaries, down to the
ast at Newcastle, where several beds crop out
e beach. For a good many years, the monopoly
by the Australian Agricultural Company, in
orking of the coal, has ceased to exist, and
e result, the trade has increased enormously.
Port Hunter the coal is despatched to all
of A., and even to New Zealand and California.
belonging to the carboniferous system have
been discovered also in Western A., near Perth, and
oal has been successfully, though not so
nively wrought there.
er gold and coal, the next most important
alian mineral is *copper*. The Burra Burra
, in South A., were discovered in 1842. The
is 17 feet wide, and of vast extent. The ore
contains 75 per cent. of metal, and is quarried out
like stone in immense masses. Copper has also
been wrought for several years at Bathurst, in New
South Wales. The poorest ores are here most
abundant, the rich pyrites existing only in small
quantity. Traces of copper have been noticed in
Western Australia.

Iron is spread in great profusion over all the
continent. To such an extent does it exist in several
of the mountains on the north coast, that they
violently affect the magnetic needle. At Berrima,
in New South Wales, an oxidulated iron ore, from
which is manufactured a good steel, has been
worked, but not successfully. Iron has been noticed
in quantity in both Southern and Western Australia.

Lead is most abundant east and south-east from
Adelaide, at Mount Beevor, and near Cape Jervis.
The ore of Glen Osmond mines, near Adelaide,
yields 75 per cent. of lead, besides a proportion of
silver. This metal is also wrought at Geraldine, in
Western Australia.

Manganese, zinc, quicksilver, and antimony have
been met with in South A., as also good specimens
of jasper, chalcedony, and opal.

Zinc and quicksilver are mentioned as occurring
in Western Australia.

Botany and Zoology.—The natural history of A. is
remarkably different from that of any other quarter of
the globe. Its trees—which seldom form dense forests,
but are scattered as in a lawn or park, where the
colonist finds pasture for his flocks without any pre-
vious clearing—are, almost without exception, of very
peculiar appearance. Among the largest of them
are species of *Eucalyptus* (q. v.), some of which attain
the height of 150 or 200 feet, rising without branches
to at least half their height, their stately stems
resembling beautiful columns. Some of the Eucalypti,
on account of their resinous exudations, are known
to the colonists as Gum-trees. Their leaves are
leathery. It is, indeed, a general characteristic of
the trees and shrubs of A., that their leaves are ever-
green and of a firm texture; and although in this a
beautiful adaptation may be perceived to the pre-
vailing dryness of the climate, the foliage wants the
delicacy and the liveliness of tints which in other
countries form so much the charm of the landscape.
The *Casuarinæ* (see CASUARINA) or Cassowary-trees
(Beef-wood, She-oak, Swamp-oak, &c.), among which,
as among the *Eucalypti*, are some of the largest and
most useful timber-trees, are still more singular in
appearance; their long, wiry, jointed branchlets,
which greatly resemble those of *Equiseta*, are quite
leafless, having only very small sheaths instead of
leaves. Equally destitute of foliage are the greater
number of the *Acacias* (q. v.), which abound in the
Australian flora. The abundance of *Proteaceæ*—
which order includes the genus *Banksia*, already
noticed in the geology—connects the flora of A.
with that of the Cape of Good Hope, to which
there are also other points of resemblance; and
although true heaths do not appear, their place
is supplied by a variety of heath-like plants of
other natural orders, and particularly of the
order *Epacrideæ*, of which some (of the genus
Epacris) now take their place with heaths among
the favourite ornaments of our green-houses. *Arau-
carias* (q. v.) form a connecting link between the
flora of A. and that of Chili. In the more northern
parts, palms and other tropical productions connect
it in like manner with that of the south-east of Asia.

Few of the trees or shrubs of A. produce edible
fruits, and those known as Tasmanian Currants,
Tasmanian Cranberries, &c., are not of much value.
The seeds of the Araucarias are edible, having
some resemblance to almonds. Almost none of the
native vegetable productions of A. have been found

worthy of the care of the gardener, except as objects of beauty or curiosity; and it produces no plant which has yet found its way, or seems in the least degree likely to find its way, into agriculture—unless, indeed, some of its pasture plants may prove to be peculiarly adapted to dry climates. But the cultivated plants of other countries have been introduced with great success by the colonists, and their gardens boast not only of the fruits common in England and the south of Europe, but of some of those of China.

The zoology of A. is particularly characterised by the prevalence of Marsupial (q. v.) Quadrupeds, of which comparatively few exist in any other part of the world. Some of them are herbivorous, as the Kangaroos (q. v.), Potoroos (q. v.), and Wombats (q. v.); some feed indifferently on roots and insects, as the Bandicoots (q. v.); some are carnivorous, as the Thylacine (q. v.) and the Dasyure (q. v.)—the *tiger* and the *wild cat* of the colonists—but all are marsupial; that is, the females have a pouch for the young, which are born in a much less advanced state than the young of other viviparous animals. Besides its marsupial quadrupeds, A. has few others, yet known, except some species of bat; a kind of dog, known as the Dingo (q. v.); and the *Echidnas* (q. v.) and duck-bills (*Ornithorhynchus*) (q. v.), animals which have been regarded as forming a connecting link between quadrupeds and birds, both upon account of external form and anatomical structure, and to which nothing at all similar exists in any other part of the world.

Many of the birds of A. are very beautiful, but they do not exhibit peculiarities so general and striking as its quadrupeds, or even its plants. The Emu (q. v.) may be regarded as the Australian representative of the Ostrich and Cassowary. The Black Swan is chiefly remarkable for its colour. Ducks of various kinds, falcons, doves, parrots, and many other birds of families well known elsewhere, connect the natural history of this isolated continent with that of the other regions of the globe.—Reptiles are numerous, but exhibit as a class no very marked peculiarities, nor is there in any other department of zoology so wide a difference from the rest of the world as in the Mammalia. Among the fish of the Australian shores and rivers are many species which are not found elsewhere, but they present no remarkable common characteristic. Among them are no trouts, salmon, or other *Salmonidæ*, which, indeed, do not extend into the southern hemisphere. A premium has been offered for the introduction of salmon into one of the colonies.

As to the cultivated productions, wool may be reckoned the grand staple of Australia. For sheep-farming, the country, so far as it is not a desert, seems to be admirably adapted. The colonist, instead of having, as in America, to hew his way through dense forests, with tangled underwood, sees around him either open pastures or parklike woods overshadowing their green sward. His main difficulty is the scarcity of water, or rather the possibility that such a scarcity may occur. Wheat is grown to advantage, particularly in South Australia; cotton, tobacco, and sugar are produced in New South Wales and Queensland; the vine is grown extensively by the colonists, who have begun to avail themselves of the capabilities of the respective colonies by rearing the productions of tropical and temperate climates, both of which are possessed by Australia.

History.—In 1606, the north coast was descried by the Dutch on board of the *Duyfen*, and about the same time by a Spanish expedition sent from Peru in 1605, one of the commanders of which gave his name to Torres Straits. It is probable, however, that A. had been long known to the Chinese. In 1619 and 1622 respectively, the west and south-west coasts were seen. In 1642, the island, called for some time Van Diemen's Land, but now Tasmania, was visited by Tasman, who, within a month, sighted also New Zealand. In 1697, Swan River was discovered by Vlaming. In 1770, Cook, then on his first voyage, explored nearly the whole of the east coast, designating the same New South Wales. In 1798, Bass, a surgeon in the navy, ascertained the separation of A. and Tasmania, by passing through the strait that bears his name. In 1802, Port Phillip was entered; and in the same year, Flinders pretty nearly completed the general outline by sailing along the southern shore. To pass from discovery to colonisation: there was established, in 1788, the settlement of New South Wales, and from this all the other British Australasian settlements, with the exception of Swan River, have successively been planted. Norfolk Island, erected, in 1790, into a penal settlement for New South Wales, has recently been allotted to the descendants of the mutineers of the *Bounty*, removed for this purpose from Pitcairn's Island. The other colonies, whether offshoots or not of New South Wales, assumed an independent existence in the following order: Tasmania, 1825; Western A. or Swan River, 1829; South A., 1836; New Zealand, 1841; Victoria, 1851; and, lastly, Queensland or Moreton Bay, 1859 (see these heads). Besides these flourishing colonies, a settlement was established near Port Essington in 1839, but was abandoned in 1845, on account of the unhealthiness of the climate. Subjoined is a summary table of statistics for all the more important of these dependencies, not including those incipient settlements that have been effected along the course, and at the terminus, of the overland line of telegraph.

The native population of A. belongs to the race or group of tribes variously designated as *Negritos*, *Austral Negroes*, or *Kohomonsians* ('black islanders'). The chief members of the group, besides the Australians, are the Papuans of New Guinea, New Caledonia, and New Hebrides, and the natives of Tasmania. See Ethnology, Negritos. The Tasmanians are now extinct, and the Au are rapidly diminishing in number; their to will be considered under the head of each In Victoria they still number 1330 (not incl the foregoing table). The 38,540 natives Zealand (also not included in the table) be the Polynesians (q. v.).

AUSTRA'SIA, or the East Kingdom, the name
rn, under the Merovingians, to the eastern pos-
sions of the Franks, embracing Lorraine, Belgium,
d the right bank of the Rhine, and having their
ntral point at Metz. At the time of the rise of
e Frankish power, these districts were of great
portance, as they formed the connection with the
rman mother-country, and were the most thickly
habited by Franks. After the time of Charles
artel, the division of the Frankish kingdom into
and Neustria lost its political importance. Under
rma_ne's successors, A. merged into Germany -
s Neustria, or West Frank-land, into France.

AU'STRIA, ARCHDUCHY OF, the cradle and
ucleus of the Austrian empire, lies on both sides of
e Danube, from the mouth of the Inn to Presburg,
the borders of Hungary, and embraces an area of
out 15,000 square miles, with a population, in 1854,
2,624,237. It now forms three of the crown-lands,
administrative provinces of the empire—viz.,
wer and Upper Au tria (or Austria below, and
ustria above the Enn), and the Duchy of Salz-
rg. See AUSTRIA, EMPIRE OF. The south and
st portions are mountainous; the north and east
e more level and fertile, containing the great plain
Vienna, the Marchfeld, &c. The population is
stly German and Catholic. The chief towns,
ides Vienna, are Wiener-Neustadt, Salzburg,
yer, Linz, and Ischl (q.v.).

AU'STRIA, EMPIRE OF. The Austrian dominions
a compact territory, with a circumference of
ut 5350 miles. It is included between 42° 51'
lat., and between 12° 26' 20" E. long. The body
the empire lies in the interior of Europe, though,
means of the southern projection of Dalmatia, it
s about 1200 miles of sea-coast, on the Adriatic.
ith the rest of its circumference, it borders on
nice, Lombardy, Switzerland, Bavaria, Saxony,
ussia, Russia, Moldavia, Wallachia, Servia, Turkey,
d Montenegro. It embraces an area of 237,202
uare miles, and a population on December 31,
of 35,904,435. The empire falls into seven-
n administrative divisions called crown-lands
ronländer), together with a Military Frontier.
eir area and population are as follows:

Lower Austria,	7,[illegible]	1,[illegible]
Upper Austria,	4,[illegible]	[illegible]

Military Frontiers,	12,[illegible]	[illegible]
Total,	237,202	35,904,435

e census of 1867 for these crown-lands and
Military Frontiers returned a population of
330,082 shewing an increase of 3,574,433, a
le more than a tenth.

The population comprises the military establish-
nt, which, according to official returns, was, at
beginning of 1872, on a peace-footing, 278,470
n, and 838,700 on a war-footing. The naval
ces of Austria consisted, in April 1872, of 45
amers and 10 sailing-vessels.

The first eleven of these divisions—exce
Illyria and also part of Galicia,
extent of 75,180 square miles, with a population of above 12 millions, formerly belonged to the German Confederation.

Surface. Three-fourths of A. is mountainous or hilly, being traversed by three great mountain chains—the Alps, Carpathians, and Sudetes (q.v.), whose chief ridges are of primitive rock. The Rhaetian and Noric Alps stretch from Switzerland to the Danube, and contain the highest points of the Austrian territories, the Ortler Spitze rising to 12,779 English feet. Their height declines gradually towards the east, where the Leitha Hills (3000 feet), overlooking the plain of Vienna, form the transition to the Carpathians. This chain rises on the left bank of the Danube, near Presburg, and sweeping in a curve, first east, and then southward through Transylvania, again meets the Danube. The highest point is Butschetje in Transylvania, where a height of 9528 feet is reached. The central part, or Tatra Mountains, are vast granitic masses, resembling the Alps in character; the highest of these is the Lomnitz, in the longitude of Cracow, 8133 feet. The Alps are accompanied, north and south, by parallel ranges of calcareous mountains, covering whole provinces with their ramifications. The Carpathians are lapt on their northern side by sandstone formations; mountains of the same character also occupy Transylvania. Springing from the north-west bend of the Carpathians, the Sudetes run through the north-east of Moravia and Bohemia, in which last the range is known as the Riesengebirge, or Giant Mountains. The boundary between Bohemia and Prussian Silesia passes over the Schneekoppe, the highest peak of these mountains, which is 5275 feet in height. Continuous with this range, and beginning on the left bank of the Elbe, are the Erzgebirge, or Ore Mountains, on the confines of Saxony; and veering round to nearly south-east, the range is further prolonged in the Bohemian-Forest Mountains, between Bohemia and Bavaria.

The chief plains of the Austrian empire are the great plains of Hungary (the smaller of these is in the west, between the offsets of the Alps and Carpathians, and is about 4200 square miles in extent; the other, which is in the east, and traversed by the Danube and the Theiss, has an area of 21,000 square miles), and the plain of Galicia.

From the Gulf of Trieste to the south point of Dalmatia, A. has a sea-line of about 1000 miles, not counting the coasts of the numerous islands, the largest of which is Veglia, 23 miles by 12. The chief lakes are the Platten See (about 400 square miles), and the Neusiedler See (about 100 miles), both in Hungary. The first is navigable by steamers, and both are rich in fish, and have fruitful vineyards around them. The Alps and Carpathians enclose numerous mountain lakes. The Long Lake in the Tatra Mountains lies at an elevation of 6000 feet. The most remarkable of all is the Zirknitz Lake (q.v.) in Illyria. There are extensive swamps or morasses in Hungary. One connected with the Neusiedler See covers some 80 square miles. A good deal has been done in draining morasses.

The leading rivers that have navigable tributaries are: the Danube (q.v.), which has a course of 849 miles within the Austrian dominions, from Passau, at the mouth of the Inn, to Orsowa, on the frontier of Wallachia, and receives, on the right, the Inn, Traun, Ens, Leitha, Raab, Drau, and Save; and, on the left, the March, Waag, Neutra, Gran, Theiss, Bega, and Temes: the Vistula (q.v.), with its tributary the Bug: the Elbe (q.v.), with the Moldau and Eger: the Dniester and Adige (q.v.) have no navigable tributaries; this last, which rises in the
tian Alps, and flows past the famous city of

Trent, enters Lombardy above Verona, and confers on that country the benefits of what commercial importance it possesses—being navigable only up to a point below Legnago. The Rhine only bounds the empire for about fourteen miles above Lake Constance. The Isonzo, Zermagna, Kerka, and Narenta flow into the Adriatic.

The canal system of Austria is in general not extensive. Canal construction is recent. The Vienna and Neustadt Canal, in Lower Austria, has a length of 40 miles; the Bacser or Franz Canal, between the Danube and Theiss in Hungary, 69 miles; and the Bega Canal, constructed by the Romans, between the Bega and Temes, 83 miles. Extensive lines are still capable of being opened up, affording the only possible communication with many places now inaccessible, and, at the same time, the means of rescuing tracts of arable land from inundations.

The *climate* of A. is on the whole very favourable; but from the extent and diversity of surface, it presents great varieties. In the warmest southern region between 42°—46° lat., rice, olives, oranges, and lemons ripen in the better localities; and wine and maize are produced everywhere. In the middle, temperate region from 46°—49°, which has the greatest extent and diversity of surface, wine and maize still thrive in perfection. In the northern region, beyond 49°, except in favoured spots, neither wine nor maize succeeds; but grain, fruit, flax, and hemp thrive excellently. The mean temperature of the year is, at Trieste, 58° F.; at Vienna, 51°; at Lemberg, in Galicia, 44°.

The raw products of A. are abundant and various; and in this respect it is one of the most favoured countries in Europe. What one province lacks, another supplies. Its mineral wealth is not surpassed in any European country; it is only lately that Russia has exceeded it in the production of gold and silver. Mining has been a favourite pursuit in A. for centuries, and has been encouraged and promoted by the government. Bohemia, Hungary, Styria, Carinthia, Salzburg, and Tyrol take the first place in respect of mineral produce. Except platina, none of the useful metals is wanting. The mines are partly state property, and partly owned by private individuals. The value of their yearly produce was stated in 1851 at 119,664,781 florins (£11,966,478). Of this, salt yields 53 million florins; stones and earths, 40 millions; and metals, coal, and other products, 26½ millions. (In 1855, the value of metals and coal had increased to 37½ million florins.) Gold is found chiefly in Hungary and Transylvania, and in smaller quantity in Salzburg and Tyrol. The same countries, along with Bohemia, yield silver. The discovery of quicksilver at Idria (q.v.) first brought this branch of mining industry into importance. This metal is now also found in Hungary, Transylvania, Styria, and Carinthia. Copper is found in many districts; tin, in Bohemia alone. Zinc is got chiefly in Cracow and Carinthia. The most productive lead-mines are in Carinthia. Iron is found in almost every province of the monarchy, the chief Styria, Carinthia, and Carniola are chief seats. The production, though great, is not yet equal to the consumption. Antimony is confined to Hungary; arsenic is found in Salzburg and Bohemia; cobalt in Hungary, Styria, and Bohemia; sulphur in Galicia, Bohemia, Hungary, Salzburg, &c., though not enough to supply home consumption. Graphite is found abundantly in Bohemia, Moravia, Carinthia, &c.

The useful earths and building-stones are to be had in great profusion; all sorts of clay up to the finest porcelain earth (in Moravia, Bohemia, and Hungary), and likewise marble, gypsum, chalk, &c. Of precious and semi-precious stones are the Hungarian opal (which passes in commerce as oriental), Bohemian garnets (the finest in Europe), chalcedonies, agates, beryl, amethyst, jasper, ruby, sapphire, topaz, &c.

The following table shews the principal metals and minerals produced in Austria in 1867, and their average value in florins at the place of production:

		Weight.	Value.
Gold,	(Austrian pounds)	3,502	2,107,041
Silver,	"	81,074	3,242,960
Quicksilver,	(Austrian hundredweight)	7944	793,000
Tin,	" "	531	53,000
Zinc,	" "	40,296	402,960
Copper,	" "	47,653	2,382,650
Lead and Litharge,	" "	136,668	1,366,680
Iron, raw and cast,	" "	5,705,761	14,264,402
Graphite,	" "	27,377	273,770
Mineral coal,	" "	103,455,324	17,587,404

A. is peculiarly rich in salt. Rock-salt exists in immense beds on both sides of the Carpathians, chiefly at Wieliczka (q.v.) and Bochnia in Galicia, and in the county of Marmaros in Hungary and Transylvania. The annual produce of rock-salt is greatly above 3 million cwt. Salt is also made at state salt-works by evaporating the water of salt springs. The chief works are those at Hallstadt, Ischl, Hallein, and Hall in Tyrol. From two to three million cwt. are thus produced annually. A considerable quantity is also made from sea-water on the coasts of the Adriatic. Of other salts, alum, sulphate of iron, and sulphate of copper are the chief. There are inexhaustible deposits of coal in the monarchy; but they have not yet been rightly explored, nor are nearly all that are known yet worked. They are spread over all the provinces, but the richest are in the mountain-systems of Moravia and Bohemia. Of recent years, however, a great deal has been done to develop this particular branch of mining. A. has abundance of mineral springs, frequented for their salubrity; 1000 are enumerated, some of them of European reputation, as the sulphurous baths of Baden in Lower A., the saline waters of Karlsbad, Marienbad, and Ofen, &c.

The *veg table productions*, as might be expected from the vast variety in the soil and position of the different provinces, are extremely various. Although three-fourths of the surface is mountainous, more than five-sixths is productive, being used either for tillage, meadows, pasture, or forest. Grain of all kinds is cultivated, most abundantly in Hungary and the districts south of it on the Danube, in Bohemia, Moravia, Silesia, and Galicia. Agriculture is not yet far advanced; the prevailing system is still what is called the three-field system, introduced into Germany by Charlemagne, in which a crop of winter wheat is followed by one of summer grain, and that by fallow. In Hungary, the Magyar adheres to his primitive husbandry, the German and Slave are adopting rational methods. Rice is cultivated in the Banat, but not enough for the consumption. Potatoes are raised everywhere; and in elevated districts are often the sole subsistence of the inhabitants. Horticulture is carried to great perfection; and the orchards of Bohemia, A. proper, Tyrol, and many parts of Hungary, produce a profusion of fruit. Great quantities of cider are made in Upper A. and Carinthia, and of plum-brandy in Slavonia. In Dalmatia, oranges and lemons are produced, but not sufficient for the requirements of the country; twice as much olive-oil is imported as is raised in the monarchy.

In the production of wine, A. is second only to France. With the exception of Galicia, Silesia, and Upper Austria, the vine is cultivated in all the provinces; but Hungary stands first, yielding not

empire, at the commencement of 1870,
7 cities which had a population above
tants; and three with more than
na at that date counting 834,284.
The population of Austria embraces
nber of races, distinct in origin and
n that of any other European country
a. The proportions in this respect
from the official statements of 1870.

The Slaves are the most numerous race, amounting to 16,219,000, nearly 50 per cent. of the whole population in 1870. They form the bulk of the population of Bohemia, Moravia, Carniola, Dalmatia, Croatia, Slavonia, the Military Frontiers, the Woiwodina, the north of Hungary, and Galicia. They are, however, split up into a number of peoples or tribes, differing greatly in language, religion, culture, and manners; so that their seeming preponderance in the empire is thus lost. The chief branches of the Slavic stem are the northern Czechs (the most numerous of all), Ruthenes, and Poles, and the southern Slowens, Croats, Serbs, and Bulgarians. The Germans numbered 9,040,000, or about 25 per cent. They are dispersed over the empire, but predominate most in the duchy of A., Salzburg, Tyrol, Styria, Carinthia, the west of Hungary, &c. The Romanic peoples (speaking languages derived from that of ancient Rome) amounted to 3,456,000, or fully 9½ per cent., and are divided into western and eastern. To the first, the Germans give the general name of Welsch. They consist of Italians, inhabiting the south of Tyrol, Istria, and Dalmatia; the Ladins (Latins), occupying some valleys in Tyrol; and the Friauls about Gortz, north of Triest. The eastern Romans are the Valaks or Walachians, styled by themselves Rumuni, who are found in Transylvania, Hungary, the Woiwodina, Bukowina, and Military Frontiers. The Magyars, or Hungarians proper, numbered 5,631,000 (over 15 per cent.): they are located chiefly in Hungary and Transylvania; also in the Woiwodina, and a few in Croatia and Slavonia. The small remaining portion are composed chiefly of Jews, Armenians, and Bohemians or gipsies; and collectively they number 1,354,000, which is pretty nearly 3½ per cent.

As to *religion*, the great bulk of the nation is Roman Catholic. At the beginning of 1870 there were 23,954,233 Roman Catholics; of Greeks in union with the Church of Rome there were 3,941,796; not in union, 3,050,830. The Protestants of all denominations numbered 3,570,989; and the Jewish persuasion claimed 1,575,861. The Church of Rome has 11 archbishoprics and 57 bishoprics, and an army of secular priests. At the accession of Joseph II., there were 2024 convents; but at the end of the French war (1816), they had been reduced to 880. There are at present nearly 300 abbeys, and above 500 convents in the empire.

Education, since 1849, is under the care of a minister of Public Worship and Instruction. As compared with other German states, the education of A. presents some peculiarities. There is a greater prevalence of establishments where the pupils both live and receive instruction; also of schools for special callings. Instruction, again, whether high or low, is mostly gratuitous, or of trifling cost, being provided from general or local public funds. The government has recently made liberal allowance for elementary education. Another peculiarity is the sway of the clergy, both in schools and universities. The primary schools are entirely in their hands. The Jesuits, banished in 1848, have been allowed to return, and have had their schools restored. The number of elementary schools has increased greatly in recent times. In German Austria the law enforces compulsory attendance at the 'Volks-schulen,' or national schools, of all children between the ages of six and twelve; and parents are liable to be punished for neglecting to send them. Hungary is still backward in elementary education. There are seven universities in the empire. They are at Vienna, Prague, Gratz, Innsbruck, Pesth, Cracow, and Lemberg. The first four of these are classed among German universities, and were attended as follows, in the summer term of 1872:

	Vienna.	Prague.	Gratz.	Innsbruck.
Professors and Teachers—				
Ordinary Professors, . .	68	43	40	41

Non-Matriculated Students,	317	97	76	84
Total,	3881	1709	926	612

The university of Pesth had in the same year 53 professors and 1700 students; Cracow and Lemberg, the universities of Galicia, and the other Slavonian provinces, numbered 70 professors and 1800 students. There are also a large number of establishments where the pupils are received young, and educated and trained for special professions, for the army and navy, for the counting-house, for the mine and the farm, as accoucheurs, &c. There are besides a large number of institutes for the promotion of science and art. The fruits of this extensive educational system are not what might be expected, in consequence of the priestly and monarchical restrictions which hedge it round. The chief libraries are the Imperial and University libraries of Vienna. There are in the whole monarchy 362 newspapers and other periodical prints; of which only 134 are political. Fully the half are in German; but the whole are fettered by conditions which render them quite worthless as organs of public opinion.

The *manufacturing industry* of A. is not yet adequately developed. The annual value of its manufactures—not including small trades—is estimated at 1000—1200 million florins, while that of its husbandry may reach 3000 millions. Bohemia takes the lead in this industry, then follow Austria proper, Moravia and Silesia, and Hungary. Vienna is the chief seat of manufacture for articles of luxury; Moravia, Silesia, and Bohemia for linen, woollen, and glass wares; Styria and Carinthia for iron and steel wares. The chief manufactured articles of export are those of silk and wool; the only others of consequence are linen twist, glass wares, and cotton goods. The yearly value of manufactured iron is about 54 million florins. The glass wares of Bohemia are of special excellence. The hemp and flax industry is one of the oldest and still most important. No branch of industry has risen more rapidly than that of cotton. The annual value of the silk industry is estimated at 60 million florins. The manufacture of tobacco is a state monopoly, and brings a revenue of nearly sixty million florins. The salt monopoly secures 18 millions.

In respect of *commerce*, A. is most unfavourably situated. High mountains oppose great obstacles on all hands to communication, and separate the producing districts from the only sea that touches the empire; while the chief navigable rivers have their mouths in other countries. Much has been done to remedy these obstacles. Since 1809, a length of 19,000 miles of highways has been made. The great Alpine roads over the Stelvio Pass, the Splugen, and the Semering (q. v.), are among the most remarkable constructions of our times. The first railway opened in A. extends from Linz on the Danube north to Budweis on the Moldau, and south to Wells and Gmunden. It is worked by horse-power. The state, in 1841, resolved to undertake the construction of railways, and since then a great extent has been laid down. The principal lines are from Vienna to Grätz, from Grätz to Cilly, thence to Triest; from Vienna to Stockeran, a to Brack; and from Vienna to Brunn, Olmütz and Prague. In Hungary, the are from Pesth to Szolnok, and from Presburg, *viâ* Waitzen, thence to Tyr total length of railways in the empire traffic at the beginning of 1870 was 45 miles. The length of lines under constr 1696, and the length for which conces been granted at that date was 171 miles.

The length of the telegraph lines in the 1870 was about 44,197 English miles.

River-communication received a grea from the introduction of steam. By m Danube Steam-company, formed in 1 second company (1852) confined to tug passengers and goods are now convey Danube between Ulm and Galatz, and c stantinople. The Austrian Danube Steam has a fleet of steamers plying on the D annual receipts from conveyance of go more than 7 million florins. This traffic vastly greater were the Lower Danube f the influence of Russia.

Subsequent patents (e. g. ngary, Croatia, &c. in 1853) regulated the between existing proprietors and their vassals, termined the indemnities due to the former ir seignorial rights.

since the year 1867, Austria has been recon- ed as a twofold empire, consisting of a German sleithan ' monarchy, and a Magyar or 'Trans- a ' kingdom. The former is generally known stria proper, and the latter as Hungary. Each two countries has its own laws, parliament, ers, and government; and the formal tie en them is a body known as the Delegations. form a parliament of 120 members: the one- chosen by the legislature of German Austria, is represented by it, and the other half repre- Hungary. The person of the sovereign is t in the tie between the two members are. The Magyars claim, under certain , the right of freely electing their monarch. egations have jurisdiction over all matters the common interests of the two countries, foreign affairs, war, and finance; the of which three departments are responsible discharge of their official functions to the m, a committee of whom sits permanently. of the Delegations require to be confirmed representative assemblies of their respective ries; and in this manner it is attempted to the self-government of both Austria proper Hungary free.

administration of Austria proper is divided sent among nine ministries—Foreign Affairs, Public Education, Agriculture and Public Finance, Interior, War and Navy, Com- and Justice. Formerly the ministry was the collective organ of the emperor, and was responsible to him alone. But a bill passed by the Reichsrath in 1867, and sanctioned by the emperor, renders it responsible to that parliament of the western empire.

The Reichsrath consists of an upper and a lower house. The upper house is constituted by princes, nobles, archbishops, bishops, and life members nominated by the emperor. The lower house numbers 203 members, elected by the 14 provincial diets of the empire in the following proportions: Bohemia, 54; Dalmatia, 5; Galicia, 38; Higher Austria, 10; Lower Austria, 18; Salzburg, 3; Styria, 13; Carinthia, 5; Carniola, 6; Buckowina, 5; Moravia, 22; Silesia, 6; Tyrol and Vorarlberg, 12; Istria and Triest, 6. The members of the Reichsrath are elected in the Provincial Diets, and no one who is not a member of one of these is eligible to the wider sphere of legislation. The emperor nominates the Presidents and Vice-presidents of both houses. The rights claimed by the Reichsrath are: 1. *Consent* to all military laws; 2. *Co-operation* in legislature affecting trade and commerce, customs, banking, posting, telegraphs, and railways. 3. Examination of the estimates, and general control of the public debt. To give validity to bills passed by the Reichsrath, the consent of both chambers is required, as well as the sanction of the emperor.

The executive of Hungary is carried on in the name of 'the king' by a responsible ministry.

Finance.—The protracted wars of the first 15 years of the 19th c. had so exhausted the resources of A., and shattered her credit, that paper-money, after being already twice reduced, had again sunk to 25 per cent. of its nominal value; and even 5 per cent. loans could only be obtained at a sacrifice of sometimes more than 50 per cent. During the 30 years that followed the war, much was done to restore the state credit, and 4 per cent. state paper was bought at par. The revolution of 1848 brought new difficulties, from which the finances had not recovered, when the Crimean war increased the expenditure; the Italian war must have added to it enormously; and the war with Prussia in 1866 threatened ruin to the empire.

The estimated revenue for 1871 was 17,667,859 florins; and the estimated expenditure, 122,501,173; shewing a deficit of 104,833,314 florins. The Budget estimates for the common affairs of the empire, for 1872, were—revenue, 17,208,883; expenditure, 110,647,498 florins; leaving a deficit of 93,438,615. To cover this latter deficit, the Austrian monarchy contributed 65,407,315; and the kingdom of Hungary, 28,031,584 florins. On the 1st July 1871, the national debt of the Austrian empire was 3,065,269,072 florins, or £306,526,906 sterling.

*History.**—The nucleus around which this great empire has grown was that part of the Archduchy of A. that lies below the Ens. In the age of Charlemagne, about 800, the defence of the south-eastern frontier of Germany against Asiatic hordes gave rise here to a Margraviate, called the Eastern Mark or boundary of the empire, or Ostreich (Austria), the eastern government; which, being united in 1156 to the country above the Ens, was raised to a duchy. After coming, in 1282, into the possession of the House of Hapsburg (q.v.), it rapidly rose to a powerful state. The princes of that House extended their dominion by marriage, purchase, and otherwise, over a number of other states, and from 1438 held almost uninterruptedly the throne of the German empire. By the acquisition (1526 and 1527) of the crowns of Bohemia and Hungary, the House of A. rose to the rank of a European monarchy. In 1804, Francis

* As the history of A. and its rulers involves, for many centuries, the main strand of the thread of European history, it is given at somewhat more than the usual length.

declared himself hereditary Emperor of A., and, two years afterwards, laid down the title of Emperor of Germany and King of the Romans.

In the earliest times, what is now the Duchy of A. was inhabited by the Taurisci, a Celtic people; but their name subsequently disappeared before that of the Norici. After the conquest of the Norici by the Romans (14 B.C.), the country to the north of the Danube belonged to the kingdom of the Marcomanni (q. v.); on the south of the river lay the Roman provinces of Noricum and Pannonia, in which last was the municipal city of Vindobona (Vienna). Tyrol formed part of Rhætia. All these boundaries were swept away by the irruption of the northern peoples; and the regions in question were occupied in succession, during the 5th and 6th centuries, by Boii, Vandals, Goths, Huns, Lombards, and Avari. After the Lombards had settled in Italy, the Ens came, about 568, to be the boundary between a tribe of German origin and the Avari, a people who had penetrated thither from the east. The Avari having, in 788, crossed the Ens, and fallen upon Bavaria, then part of the Frankish empire, Charlemagne drove them back (796) as far as the Raab, and united the district from the Ens to that river with Germany, under the name of the East Mark, Marchia Orientalis, or Austria. He sent colonists, mostly Bavarians, into the new province, and appointed over it a margrave. It came into the possession of the Hungarians in 900, but was reconquered by Otto I. in 955, and reunited with Germany.

As margrave of the reconquered province, the emperor, in 983, appointed Leopold of Babenberg (q. v.), whose dynasty ruled A. for 269 years. Under Henry Jasomirgott (1141—1177), the Mark above the Ens was annexed to the Lower Mark, the united province raised to a duchy, and important privileges conferred on the newly named duke and his heirs. This Henry Jasomirgott took part in the second crusade; he also removed the ducal residence from Leopoldsberg to Vienna, now first called a city, and began the building of the cathedral of St Stephen. Under his successors, numerous additions (Styria, Carniola) were made to the possessions of the House. Leopold VI. undertook numerous expeditions against the Hungarians and the infidels, and is reckoned the best of the Babenberg princes. The line became extinct with his successor, Frederic, who fell in battle with the Magyars (1246).

Then followed an interregnum from 1246 to 1282. The Emperor Frederic II. at first treated the duchy as a lapsed fief of the empire; shortly, claims were set up by Count Hermann of Bavaria, who was married to a niece of the deceased margrave, Frederic; and when Hermann died, and the empire was distracted by the contests between rival emperors, the 'States' of A. and Styria chose Ottokar, son of the Bohemian king, as duke, who made good his nomination about 1260. Ottokar, refusing to acknowledge Rudolf of Hapsburg as emperor, was defeated, and lost his life and possessions, in the battle of Marchfeld (1278); and the emperor shortly afterwards (1282) conferred the duchies of A., Styria, and Carinthia on his son Albrecht.

The accession of the Hapsburg dynasty with Albrecht I. (q. v.) was the foundation of A.'s subsequent greatness. The despotic Albrecht contended successfully with Hungarians and Bavarians, but while attempting to subdue the Swiss, he was murdered near Rheinfelden (1308) by his nephew, John of Swabia, whom he had deprived of his hereditary possessions. Of his five sons, Frederic was chosen (1314) by a party to the imperial throne, but was defeated (1322) by his rival, Ludwig of Bavaria. Duke Leopold was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons that had thrown off their allegiance to Albrecht I. At last, by the death of all his brothers, Albrecht II. reunited the Austrian possessions, increased by various additions. After his death (1358), two sons, Rudolf and Albrecht III., successively followed in the Duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach, in seeking to regain the Hapsburg possessions in Switzerland. The posterity of Albert and Leopold formed the two lines of A. and Styria. During Albrecht III.'s reign, Tyrol and other districts were ceded to Austria. After his death (1395), the dukedom was held by his son, Albrecht IV. Albrecht V., who succeeded his father in 1404, by marrying the daughter of the Emperor Sigismund, succeeded (1438) to the thrones of Hungary and Bohemia, and was at the same time raised to the dignity of German Emperor, as Albrecht II. With his death, in 1439, Bohemia and Hungary were for a time lost to the House of A., as were also, after a bloody struggle, the last of the family possessions in Switzerland. But the imperial dignity was henceforth uninterruptedly held by them. With Ladislaw, Albrecht's son, the Austrian line of the House closed (1457), and their possessions went to the Styrian line. Of this line was the Emperor Frederic III., who raised the dignity of his House by making A. an archduchy. After the death of Ladislaw and of his own brother, Albrecht, Frederic came into the undivided possession of the archduchy (1464).

His son, Maximilian I., by marrying Maria, daughter of Charles the Bold, acquired (1477) the Netherlands. Becoming emperor on the death of his father (1493), he ceded the government of the Netherlands to his son Philip. Under Maximilian, Tyrol fell again to the chief branch of the House of A., several districts were acquired from Bavaria, and fresh claims were established on Hungary and Bohemia. The court of Vienna began to be the seat of German art and science. The marriage of the emperor's son Philip with Johanna of Spain set the House of Hapsburg on the throne of Spain and the Indies. Philip died in 1506; and on the death of Maximilian I., in 1519, Philip's son, Charles I. of Spain, was elected German emperor as Charles V. (q. v.). Charles resigned by treaty all the German possessions, except the Netherlands, to his brother, Ferdinand I. (q. v.).

Ferdinand I. had married the sister of Lewis II. of Hungary; and on the death of the latter in the battle of Mohacz (1526), he claimed the kingdoms of Hungary and Bohemia, along with Moravia, Silesia, and Lausatia. His claim was contested by John Zapolya, who secured the aid of Sultan Solmas II.; and Ferdinand, after contests extending over twenty years, had finally to pay an annual tribute of 30,000 ducats to Soliman for possession of Lower Hungary. Ferdinand was also fain to surrender Würtemberg to Duke Ulrich (1534), on condition of its reverting to A. on the death of the male line. Nevertheless, the possessions of the House of A. (in the German line) were at this time already of the extent of 110,000 square miles. On the abdication of Charles V. (1556), Ferdinand succeeded to the imperial dignity; he died with the reputation of a good ruler, though he strongly conservative of everything established, introduced the Jesuits.

In the partition of the inheritance that took place among his three sons, the eldest, Maximilian II. received the imperial crown along with A., Hungary, and Bohemia; the second, Ferdinand, Tyrol and Upper A.; the third, Karl, Styria, Carinthia. Maximilian was more fortunate in Hungary than his father. The death of Soliman before Szigeth led to a truce; he got his eldest son, Rudolf, crowned king of Hungary in 1572, and shortly after

a, and also chosen king of Rome. But his to bring the crown of Poland into his House Maximilian II. was fond of peace, tolerant on, and a just ruler. He died 1576; and of sons, the eldest, Rudolf II., became emperor. him, the possessions of the Archduke Ferdi- Tyrol, who had married Philippine Welser the beautiful daughter of an Augsburg , reverted to the other two lines, Ferdinand's not being considered noble. Rudolf II. to the old feudal usages, and was a t sovereign, leaving everything to his s and the Jesuits. His war with the Porte nsylvania brought him little credit; and the nts of Bohemia, oppressed by the Jesuits, from him a charter of religious liberty. At was obliged, in 1608, to cede Hungary, and, Bohemia and A., to his brother Matthias Matthias, who became emperor in 1612, d a 20 years' peace with the Turks, and 617 and 1618) Bohemia and Hungary to his Ferdinand, son of the Archduke Karl of hird son of Maximilian II. Matthias lived e outbreak of the Thirty Years' War (q. v.), March 20, 1619.

refused to acknowledge his successor, II. (q. v.), to whom all the Austrian ns had again reverted, and chose the Palatine, Frederic V., the head of the nt union, as king. The States of A. and ngarians were also refractory. But the Prague (1620) subjected Bohemia to Ferdi- rho formally set about rooting out Protes- in that country and in Moravia, annulled ht of electing their king, and the patent of freedom granted them by Rudolf II., and Catholic reformation tribunal which drove ls into exile. The emperor also succeeded ting acknowledgment of his sovereignty States of A., among which Protestantism nated; after which Protestantism was y prohibited. Hungary also was at last d to yield, which had revolted under the f Transylvania. But this religious war ecution cost the House of A. the life-blood ssessions. Of 772 cities in Bohemia, only e left; of 30,700 villages, only 6000; of inhabitants, only 780,000. Under Ferdi ccessor, the Emperor Ferdinand III. (1637 A. continued to be a theatre of war; and ace of Westphalia (1648), had to cede Alsace se. Ferdinand III.'s son and successor, I., provoked the Hungarians to rebellion by nty. Tekeli (q. v.) received aid from the d Kara Mustapha besieged Vienna (1683); as rescued only by an army of Poles and under John Sobieski, hastening to its assist- he emperor's generals now reduced the Hungary, which was declared a hereditary in the male line (1687). Prince Eugene d the Porte (1699) to restore the country the Danube and Theiss, and, in 1718, to er important provinces to Hungary. The between Leopold and Louis XIV. of France ership to the king of Spain, led to the war of sh Succession (q. v.), during which Leopold y 5, 1705. He was of sluggish phlegmatic , and wholly under the influence of the

eldest son and successor, the enlightened (q. v.), continued the war. He died childless 17, 1711, and was succeeded by his Karl VI. The peace of Utrecht concluded reign (1713) secured to A. the Netherlands, ntua, Naples, and Sicily. The monarchy ceed 190,000 square miles, with 29 million inhabitants, and had a revenue of 14 million florins, with an army of 130,000 men. Its strength, however, was soon much exhausted by fresh wars with France and Spain. At the peace of Vienna (1737), Karl VI. had to give up Naples and Sicily to Don Carlos of Spain, and part of Milan to the king of Sardinia; receiving only Parma and Piacenza instead. He also lost at the peace of Belgrade (1739) nearly all the fruits of Eugene's conquests, giving back to the Porte Belgrade, Servia, and the parts of Wallachia and Bosnia that had belonged to Austria. The emperor conceded all these points with the view of securing adhesion to the Pragmatic Sanction (q. v.), which conferred the succession on his daughter, Maria Theresa.

With his death (October 20, 1740), the male line of the Hapsburgs was extinct, and Maria Theresa, who was married to Franz Stephan, Duke of Lorraine, assumed the government. But counter-claims were raised on all sides, and a violent war arose, in which England alone sided with Maria. Frederic II. of Prussia conquered Silesia. The Elector of Bavaria took the title of Archduke of A., was crowned king of Bohemia at Linz and Prague, and elected emperor as Karl VII. (1742). The Hungarians alone stood by their heroic queen; who, at the peace of Breslau (1742) was forced to yield Silesia to Prussia. Frederic renewed the war by coming to the assistance of the emperor; but Karl dying (1745), Maria Theresa's husband was elected German emperor as Franz I. A second treaty of peace (1745) secured Silesia anew to Prussia; and at the peace of Aix-la-chapelle (1748), A. had to cede Parma, Piacenza, and Guastalla to Don Philip of Spain, and several districts of Milan to Sardinia. These sacrifices secured the existence of the Austrian monarchy; but Maria Theresa wished to recover Silesia, and with this view, entered into alliance with France, Russia, Saxony, and Sweden; but after a bloody Seven Years' War (q. v.), Prussia retained Silesia, and A. had spent her blood and treasure in vain. At this time, paper-money first appeared in A., under the name of state-bonds. At Franz's death (1765), his son, Joseph II., became German emperor, and joint regent with his mother of the hereditary states. Collateral branches of the House of A. were planted by the younger sons of Maria Theresa, the Archduke Leopold in Tuscany, and the Archduke Ferdinand, who married the heiress of Este (see Modena). In the first partition of Poland (1772), A. acquired Galicia and Lodomeria, and the Bukowina was ceded by the Porte in 1777. At the death of the empress in 1780, the monarchy had an extent of 234,000 square miles, with a pop. of 24 millions, and a debt of 160 million florins. The administration of Maria Theresa was distinguished by unwonted unity and vigour, both in home and foreign relations.

Her successor, Joseph II., was an active reformer in the spirit of the enlightened despotism of the times; though often rash and violent in his mode of proceeding. He introduced economy into every department, remodelled the censorship of the press, granted liberties and rights to Protestants, abolished 900 convents, and revised the school-system. His protective system of duties, though exhibiting his narrowness as a statesman, gave a start to native manufactures. But his reforming zeal and passion for uniformity excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the government by his brother, the Grand Duke of Tuscany, as German emperor, Leopold II. who succeeded in pacifying the Netherlands and Hungary. Peace was concluded with Prussia and Turkey (1790). The fate of his sister, Marie

fortunes of his own daughter and her son—all furnished grounds of claim to that full indemnity for her losses which A. obtained at the close of the war. In the remodelling of the map of Europe that took place at the Congress of Vienna (1815), 32,000 square miles were added to the 253,000 possessed by A. after the last partition of Poland, besides the advantages she gained in point of compactness, and facilities for trade, especially by the acquisition of Venice and Dalmatia. Ferdinand, the emperor's uncle, was also restored to the grand duchy of Tuscany, of which he had been dispossessed by Napoleon.

After that time, A. exerted a powerful influence in European politics generally, and more especially in the German Confederation; and that influence was uniformly hostile to constitutionalism (see METTERNICH). When the Polish revolution broke out, a strict neutrality was assumed; but a Polish corps that was driven into the Austrian territories was disarmed, and sent into Hungary, while a Russian division that had taken refuge on Austrian soil was let go, and equipped with the Polish weapons.

The death of Francis I. (March 2, 1835) made little

agary, the Magyars, though the Germans
e within the country itself were hostile to
gan the campaign with decided success.
Bem conquered Transylvania in spite of Russian aid; and the rest of the Hungarian army advancing westward in spring, were successful against the imperial forces at Szolnok and Waitzen. Windischgratz was replaced in the command by Welden, but the imperial cause was not improved. Kossuth's hopes rising, he proclaimed the deposition of the House of Hapsburg, and virtually made Hungary a republic. By May, Pesth and Ofen were again in the hands of the Magyars; and although General Welden was recalled, and the command given to Haynau, there was little prospect of success against the Magyars, if a treaty with the czar had not brought the aid of a Russian army under Paskewitsch. The Austrians still suffered several reverses, and the Hungarians performed splendid feats of arms, such as Görgei's victory at Waitzen, and Klapka's sally from Komorn; but from June, the war on the whole began to be more favourable to A., whose forces were well managed by Haynau and Jellachich; and the intervention of the Russians brought an irresistible weight of numbers against the Magyars. After the affairs of Szegedin and Debreczin, Haynau's engagements on the Theiss, and the raising of the siege of Temeswar, it was in vain that Kossuth transferred the dictatorship to Görgei. Görgei, whether from treachery, as the other Magyar leaders maintain, or from necessity, as he himself avers, laid down his arms to the Russians at Vilagos (August 13). The surrender of Komorn, in September, completed the subjugation of Hungary, which was treated as a conquered country, and the officers taken in Arad were dealt with by Haynau with a blood-thirsty rigour.

A. was now free to attend to politics, internal and external, and the spirit of the restoration soon shewed itself. One important fruit of the revolution was retained—the liberation of the soil from the burdens and trammels of feudalism. All other liberal concessions very soon disappeared. For a time, the forms of the constitution of March 1849 were retained; but the rigorous military government and the surveillance exercised over the press, shewed the tendency of things. The fundamental principles of the constitution turned out to the profit only of the Catholic Church, which got rid of the placetum regium. In the beginning of 1851, Schmerling and Bruck, the liberal element of the ministry, retired; and in August appeared a number of imperial decrees rendering the ministers accountable to the emperor alone. At last, January 1, 1852, it was announced that the constitution and the fundamental rights were abolished, trial by jury set aside, the old press law revived, &c. This was followed by still greater concessions of influence to the clergy. The emperor did not conceal his predilection for absolute military government. All this was not effected without manifestations of discontent. The fires of revolution were still smouldering in Hungary and Italy; and in Lombardy, though still under strict military law, a tumult broke out, February 1853, in which a number of officers and soldiers were stabbed. The finances, too, notwithstanding vigorous measures for improving the material resources of the country, continued in a bad state, so that incessant loans were required to cover the current deficit.

On the confused arena of German politics, the struggle for ascendency was kept up between A. and Prussia. In October 1850, the two powers were armed and ready to come to blows; but the bold and determined policy of Schwartzenberg prevailed, and Prussia gave way. The points in dispute it might be difficult for any but a German to understand, even if it were worth trying. See GERMANY, HESSE-CASSEL. The result was that Prussia's

the treaty of 1815, was far from satisfactory; but what was chiefly complained of by the other powers was her interference in the affairs of the independent states of the peninsula. By means of secret treaties (copies of which were laid before the British Houses of Parliament this year, 1859), A. obtained a most undue influence in Parma, Tuscany, Modena, the States of the Church, and in the kingdom of the Two Sicilies. That influence was of course exercised in the interests of despotism, and in opposition to the welfare of the people, whose wishes their rulers, backed by Austrian troops, were enabled to set at defiance. The position of A. in Italy was canvassed at the meetings which followed the signing of the treaty of peace at Paris in 1856, but nothing resulted from the discussions. Sardinia seeing herself gradually environed by, and afraid to fall a victim to the prevailing Austrianism, after all remonstrances of a peaceful kind had failed, began to arm. A. demanded her immediate disarmament, on pain of war; but Sardinia, whose army was swelled with volunteers from every part of the peninsula, and who had previously entered into a treaty, offensive and defensive, with France, refused. A. accordingly commenced hostilities by crossing the Ticino on the

as some interesting notices.

AUTOLYCUS, a Greek astronomer and mathematician of Pitane in Æolia, about 330 B.C., wrote on the Revolving Sphere, and on the Rising and Setting of the Fixed Stars. Both works, printed in Dasypodius's *Propositiones Doctrinæ Sphericæ* (Strasb. 1572), contain, for the most part, only such propositions of spherical astronomy as can be solved by means of a globe; and, instead of presupposing the knowledge of spherical trigonometry, they seem rather to prove that A. himself was unacquainted with it.

AUTOMATON is derived from two Greek words signifying self-movement, and is usually applied to machinery constructed to represent human or animal actions. The construction of automata has occupied the attention of mankind from very early ages. Archytas of Tarentum is reported, so long ago as 400 B.C., to have made a pigeon that could fly. Albertus Magnus and Roger Bacon, in the 13th c., are said—but there is some dubiety about the matter—to have made respectively a porter to open the door, and a speaking head; while Regiomontanus, in the 15th c., is declared to have been successful in imparting life-like motion to a fly. In France, in the beginning of the 18th c., many persons busied themselves in the construction of automata; and among other things, a pantomime, in five acts, was represented by actors moved by machinery. An automatic carriage group, made by M. Camus for the amusement of Louis XIV., is stated to have been very perfect; but it is doubtful whether it was so complete as it is represented to have been. The most perfect A. about which there is absolute certainty, was one constructed by M. Vaucanson, and exhibited in Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes with its fingers in precisely the same manner as a human being does. In 1741, M. Vaucanson made a flageolet-player, who with one hand beat a tambourine; and in the same year he produced a duck. This was a most ingenious contrivance, the mechanical duck being made to conduct itself in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, &c., as naturally as its live companions; and, most wonderful of all, by means of a solution in the stomach, it was actually made to digest its food! Maelzel made a trumpeter, which, about 1809, was exhibited in Vienna, and played the Austrian and French cavalry marches with much skill. An A., produced by M. Droz, drew likenesses of public characters; and, some years ago, Mr Faber contrived a figure, exhibited in various places, Edinburgh among others, which, by means of certain keys, was made to articulate simple words and sentences very intelligibly, but the effect was not pleasant. The inventor first mentally divided the word or sentence into its distinct sounds as a phonographer would do in writing—and having determined the sounds, pressed one after the other the keys which admitted the air into the various compartments containing the mechanism constructed to imitate them. The chess-player of Kempelen was long regarded as the most wonderful of automata. It represented a Turk of the natural size, dressed in the national costume, and seated behind a box resembling a chest of drawers in shape. Before the game commenced, the artist opened several doors in the chest, which revealed a large number of pulleys, wheels, cylinders, springs, &c. The chessmen were produced from a long drawer, as was also a cushion for the figure to rest its arm upon. The A. not being able to speak, signified when the queen of his antagonist was in danger by two nods, and when the king was in check by three. The A. succeeded in beating most of the players with whom it engaged; but it turned out afterwards that a crippled Russian

officer—a very celebrated chess-player—was concealed in the interior of the figure. The figure is said to have been constructed for the purpose of effecting the officer's escape out of Russia, where his life was forfeited. So far as the mental process was concerned, the chess-player was not, therefore, an A.; but great ingenuity was evinced in its movement of the pieces (see *Chambers's Journal*, vol. xii., p. 66). In 1845, Mr John Clark of Bridgewater exhibited an *A. Latin Versifier*, which he himself described as a practical illustration of the law of evolution. 'The machine,' he said, 'contains letters in alphabetical arrangement; out of these, through the medium of numbers, rendered tangible by being expressed by indentures on wheel-work, the instrument selects such as are requisite to form the verse conceived; the components of words suited to form hexameters being alone previously calculated, the harmonious combination of which will be found to be practically interminable.' An automatic group, consisting of a child, monkey, hare, and goat, was exhibited in this country in 1856, the motions of the animals being very perfect. M. Houdin, the celebrated conjuror, is the inventor of some striking automata. Automata have also been constructed to play on the piano, and to set up type. The latter are very ingenious machines, but hitherto they have not been successful enough to warrant their general introduction. They are, however, in use in some printing-offices in London. One practical difficulty they have not yet overcome, is the spacing out of the lines; that has to be done by the human hand. See Hutton's *Mathematical Recreations; Memoirs of Robert Houdin*. Lond. 1859. Chapman and Hall.

AUTONOMY (Gr. *self-legislation*) is the arrangement by which the citizens of a state manage their own legislation and government; and this evidently may, with certain restrictions, be the case also within limited bodies of the same people, such as parishes, corporations, religious sects. The term A. is used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. The idea of two or more town communities sinking their individual independence, and forming the larger aggregate unity which we understand by a state, seems to have been intolerable to the Greek mind.

AUTUN (Bibracte, Augustodunum), a town in France, department of the Saône-et-Loire, in the Burgundian district of Autunois. Pop. 9729. It is situated on the river Arroux, is the seat of a bishop, and has a fine cathedral. Cloth, carpets, leather, stockings, and paper are manufactured in the place. The ancient Bibracte was the chief city of the Ædui, and had a much frequented Druid school; and at a later period, under the Romans, when it got the name of Augustodunum, it was no less famous for its school of rhetoric. A. was pillaged by the Saracens in 725, and nearly destroyed by the Normans in 888. There still exist at A. many ruins of Roman temples, gates, triumphal arches, and other antiquities. At the Council of A. (1094), King Philip I. was excommunicated for divorcing his queen, Bertha.

AUVERGNE, a southern central district of France, was before the revolution a separate province, composing almost exclusively the modern departments of Cantal and Puy-de-Dôme. Between the Allier and the upper course of the Dordogne and the Lot, A. rises into a highland region, having Roullonnais, Limousin, and Rouergue, as terraces of descent into the western plains, while on the east rises the Cevennes and the southern highlands. Chiefly do the cone and dome-like shapes of the summits betray a volcanic formation, but all great masses of basalt and trachyte that through the crust of granite and gneiss, rem probable that this was a chief focus of pl action. Among the summits that have appa been at one time volcanoes, the most rema are Cantal (6093), Mont-d'Or (6188), Puy-de- (4806), and Pariou; the latter, adjoining P Dôme, is basin-shaped on the top, and one finest specimens of an ancient and extinct vol all are now covered with verdure. A. falls nat into two divisions—Upper A., to the south Lower A., to the north; in which last the val Limagne, on the left bank of the Allier, is guished for extraordinary fertility. The clim colder in the mountainous districts than the sa position, with a less elevation, would lead expect, and is remarkable for furious wind violent thunder-storms; but in the deep valley heat of summer is often oppressive. The covered plateaus are desert, but the pulv volcanic earths that cover the slopes and v form a rich and fruitful soil, as is shewn b crops of grain, garden produce, fine fruits abundance of chestnuts in the south, and of in the north, as well as by extensive thriving along with flax and hemp fields and meadow in the poorer districts. Agriculture is in a neglected condition; but the breeding of especially of mules, is well managed. A. pro iron, lead, copper, antimony, and coal, and i in mineral springs.

The Auvergnese are a highland people, ra their manners, poor, ignorant, at the same honest and kind, though not free from the pr sity to revenge. They live by cattle-keeping agriculture, and by going to Paris as labo Domestic manufactures, therefore, remain c to weaving, tanning, and paper-making. A. however, produced distinguished men. It wa native place of statesmen and warriors of the and 16th centuries; and also of the Arnauld family, so distinguished in the history of Royal and of Jansenism. In more recent t Lafayette and Polignac may be named. Chief t Clermont and Aurillac (q. v.). The country de its name from the Averni, who long defended fastnesses against Cæsar, as later against the G Burgundians, and Franks, with whom they a coalesced.

VARI, a tribe of eastern origin, made their ...ance 100 years later than the Bulgarians, ... countries about the Don, the Caspian ...nd the Volga. One part of them remained ... Caucasus, another part pressed forward ... A.D.) to the Danube, and settled in ...ere they served in Justinian's army, ...sisted the Lombards to overturn the king- ...f the Gepidæ; and, about the end of the 6th c., under the mighty Khan Bajan, they conquered Pannonia. Later, they made themselves masters of Dalmatia; made devastating incursions into Germany, as far as Thuringia; and into Italy, where they warred with the Franks and Lombards, and extended their dominion over the Slaves living on, and northwards from, the Danube, as well as over the Bulgarians as far as the Black Sea. These nations at last rose against them, and, in 640 A.D., drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne, and well-nigh extirpated by the Moravians, so that, after 827, they disappear from history. They usually surrounded their settlements with fortifications of stakes driven into the ground, and earth, of which traces, under the name of Avarian Rings, are yet found in the countries formerly occupied by them. The results of the most recent criticism shew that, in all probability, the A. belonged to the same great Turanian stock as the Huns, and that their original residence was the land lying east of the Tobol, in Siberia.

AVAST, one of the peculiar terms employed on shipboard. It is a command to stop or cease in any operation going forward—such as, 'avast heaving.'

AVATAR primarily signifies, in Sanscrit, a descent, but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent or for retributive ends. It is thus almost synonymous in its signification with the Christian term *Incarnation*. The word is sometimes rhetorically employed in English literature. The avatars of Vishnu (q. v.) are the most famous in Hindu mythology.

AVATCHA, a mountain and bay of Kamstchatka. The bay is on the east coast, being by far the best harbour of the whole peninsula, and containing the capital city of Petropaulowsk (q. v.). The mountain, 9055 feet in height, is about 20 miles to the north, and not far from the sea, in lat. 52° 15' N., and long. 158° 50' E. It is a volcano with two craters—one at the summit, and the other rather more than half-way up, on the seaward side.

AVEBURY, A'BURY, or A'BIRY, a small village of Wiltshire, situated in N. lat. 51° 25', and W. long. 1° 50', 25 miles north of Salisbury, and 6 west-by-north of Marlborough. It is a place of no importance in itself, having a population of 769; but is remarkable as the site of the largest so-called Druidical temple in Europe—in fact, occupying the most of the sacred enclosure itself—and as having in its neighbourhood several remarkable barrows and cromlechs of remote antiquity.

What is called the temple occupies a flat area of ground on the south of the Kennet, a diminutive tributary of the Thames. It consists, or rather consisted, of a hundred large blocks of stone, placed on end in a circular form, around a level area of about 470 yards in diameter, bounded by a deep ditch and a high embankment forming the enclosure. There are also the remains of two small circles of stones within the enclosure, supposed to be inner temples. Of these, one consisted of two concentric circles of 43 upright stones, having a single stone near the centre; the other, a similar double circle of 45 stones, to the north-west of the former, with three large and high blocks in the centre. The stones that remain of this ancient work are not of uniform size; they measure from 5 to 20 feet in height above the ground, and from 3 to 12 in breadth and thickness.

The embankment, which is broken down in several places, had originally two entrances to the temple, eastward and westward, from which issue two long walks, bending round to the southward, each

furnished with a range of blocks on either side similar to those of the temple itself. These avenues are each upwards of a mile in length, the width varying from 56 to 35 feet. That which issues to the east, or rather south-east, after turning southward, bends near its extremity to the south-east again, and closes on a knoll called Overton Hill in two concentric oval ranges of blocks. That which issues to the west, also bends to the south, and then to south-west, ending in a point with a single block.

Of the surrounding antiquities, that which appears most closely connected with the temple is a large barrow, or lofty conical mound, called Silbury Hill, lying due south of it, at a distance of three-quarters of a mile. It is situated nearly midway between the two avenues, in the line of the ancient Roman road between London and Bath. Close to the base, it measures 2027 feet in circumference; the sloping height is 316 feet; the perpendicular height, 170 feet; the diameter of the level area at the top, 120 feet; the space covered by the whole work, over 5 acres. What proves the structure to have been more ancient than the time of the Romans, if such proof were necessary, is, that the Roman road, as it comes from the west, is straight for several miles till it reaches Silbury, when it bends round it to the south, and again proceeds in a direct line to Marlborough.

About a mile north of A. there are remains of a large cromlech, the stones of which have been overturned; and about 3 miles east there is another, which has two upright blocks standing apart, with a larger one surmounting them. In the neighbourhood, all round the Marlborough Downs, there are remains of earthworks and upright stones, and the sites of other antiquities now nearly obliterated.

Very little was known of A. temple and the antiquities in its vicinity till the year 1740, when Dr Stukeley, a somewhat fanciful antiquary, published his work, *Stonehenge and Abury, Two Temples Restored to the British Druids;* although Aubrey, an ardent student of antiquarian lore, had written an account of them in 1663, by command of Charles II., the manuscript of which still exists. None of the earlier topographers or antiquaries appear to have left any description of them. When Sir Richard Hoare, in collecting materials for his *Ancient Wiltshire*, made his examination of them in 1812, 72 years after the appearance of Stukeley's work, and 164 after the first survey by Aubrey, a great number of the stones had disappeared, and in many places it was difficult to trace out even the plan of the works. In 1849, in order to satisfy the curiosity of the lovers of antiquity as to the nature and intention of the great barrow, Silbury Hill, a tunnel was cut to its centre, but nothing was discovered to throw light on the subject. Some modern archæologists altogether reject the conclusions of Stukeley and his followers, and call for proof of any connection between the Druids and the stone-circles which it has been the fashion for the last century to call Druidical.

AVEIRO, a maritime town of Portugal, in the province of Beira, between Oporto and Coimbra, situated in an unhealthy locality at the mouth of the Vouga, which forms a wide but shallow harbour, is the see of a bishop, has 5000 inhabitants, and trade in oil, wine, oysters, sardines, and other fish, oranges, and sea-salt.

AVELLI'NO (anciently, *Abellinum*), chief town of the province of Principato-Ultra, in the former kingdom of Naples. It is situated at the foot of Monte Vergine, on which is the famous monastery founded by S. Guglielmo da Vercelli, on the ruins of a temple of Cybele, in 1119. Pop. 23,000. A. suffered greatly from earthquakes in and 1805. It has manufactures of wo s macaroni, and considerable trade in co nuts. The *nuces Avellanæ* were famous Pliny's time. Between A. and Benevent Val de Gargano, where the Samnites defe Romans in 433 A.U.C.

A'VÉ MARI'A, also ANGE'LICA SA TIO, or the Angelic Salutation, are name the Roman Catholics to a very common address to the Virgin Mary. *Ave Maria* are two words of the prayer, in Latin, w h from the angel Gabriel's salutation ' Hail, Mary, highly favoured, the Lord blessed art thou among women, and bl fruit of thy womb.' In this form, acc ordinance of Gregory I., the invocation said by the priests during mass, on the f day after Advent. With the extended the Virgin since the 11th c., the A. M. a a lay-prayer of nearly equal use with t Noster, and was sanctioned as such at th the 12th c. Accordingly, not only did C (1261) add the concluding words, *Jesus Amen*, but since the first half of the l prayer began to receive, more and more as an addition to the old formula, wha the conclusion of the modern form: ' mother of God, pray for us sinners, at the hour of our death, Amen.' As John XXII. (1326) ordains that every Catho morning, noon, and evening, at the warnin bells, repeat three aves. This ringing as a summons to morning, mid-day, and prayers, is retained in some Protestant count is still called the Ave Maria, or Angelus The aves are reckoned by the small be rosary, which are hence called Ave M the large beads are devoted to the 150 Ave Marias form—after the *Psalterium Mariæ*, and are thought to propitiatory power.

AVE'NA. See OAT.

AVENGER OF BLOOD. See BLOOD, A OF.

A'VENS. See GEUM.

AVENTI'NUS, JOHANNES THURMAYR, a and historian, born at Abensberg, Bavaria, his father was a publican, in 1476. Having at Ingolstadt, he went to Paris, where he t degree of M.A. He afterwards taught Gre mathematics at Cracow, and poetry and eloqu Vienna. In 1512, the Duke of Ba to Munich, and intrusted him of his sons. Here A. wrote his *Bavaria* (Annales Boiorum), a w him sixteen years. This work was until twenty years after his death, which in 1534, and then only with large portions than pleasant, about the Romish Church, These, however, were all restored in Camer of 1580. A. wrote several other learned wo

A'VERAGE. If any number of unequa ties are given, another quantity may be mean or intermediate magnitude, some of quantities being greater, and others less, one found, which is called the average. relation is this: that the sum of the exce greater above the A. is equal to the sum defects of the less below it. If there are vessels unequally filled with sand, and if handfuls from the greater, and add these t until the sand is equally distributed, then of the equalised measures of sand is the 7 unequal measures. If the quantities of s

the several vessels are stated in numbers, as 5, 10, 12, 8, 11, 14, 3 ounces, the A. is found by adding together the numbers, and dividing by how many there are of them—viz., 7. The sum being 63, this, divided by 7, gives 9 ounces as the average. The system of averaging is a very important and time-saving one. By averages, the farmer calculates the value of his crops; the grazier, the value of his cattle; and the forester, the value of his trees. Reflection, however, requires to be exercised in striking averages; otherwise, serious errors may be committed. If a farmer, for instance, has three lots of cattle, the first of which he averages at £25 a head, the second at £15, and the third at £9, it might be thought that the A. of the whole stock made up of the three lots would be got by taking the mean of £25, £15, and £9—viz., $\frac{25+15+9}{3} = £16\frac{1}{3}$. But this would be correct only if there were an equal number of cattle in each of the lots. To get the real A. in case of the lots being unequal, he must multiply the A. of each lot by the number of cattle in it, add the three products together, and divide by the whole number of cattle in all three lots taken together. If we suppose 9 head in the first lot, 20 in the second, and 15 in the third, the A. is $\frac{25\times 9+15\times 20+9\times 15}{9+20+15} = £15$.

AVERAGE (in Marit. Law). A rule was established by the Rhodian law (q. v.), and has prevailed in every maritime nation, that where a loss has been sustained, or expense incurred, for the general safety of the ship and cargo, a contribution should be made, in proportion to their respective interests, by the owners of the ship, freight, and goods on board; or, in modern times, by the insurers of these. To this contribution the name of *General A.* is given. The apparel, jewels, and other personal property of the passengers, not carried for purposes of traffic, and the seamen's wages and provisions, are not liable for any share in this contribution. Goods thrown overboard are now estimated at the price they would have yielded at the port of delivery at the time, freight, duties, &c., being deducted. See JETTISON. *Particular A.*, again, is the loss of an anchor, the starting of a plank, the leaking of a cask, the loss of goods washed from the deck, or the like, where the common safety was not in question, and where there is, consequently, no contribution. To losses of this description, the term A., though generally, is incorrectly applied. *Petty Averages* are the duties of anchorage, pilotage, &c. If these occur in the ordinary course of the voyage, they are not loss, but simply part of the expense necessarily incurred. But if they have been incurred in extraordinary circumstances, and for the purpose of avoiding impending danger, they are a loss which is included in the general A., and covered by the contribution. *A. Bond* is a deed which parties liable to a general A. are in the habit of executing, by which they empower an arbiter to value the property lost, and fix the proportion which shall be borne by each proprietor.

AVERDUPOIS. See AVOIRDUPOIS.

AVERNUS, in Gr. *Aornos*, or 'without birds,' called now Lago d'Averno, is a small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baiæ. It is about a mile and a half in circumference, and occupies the crater of an extinct volcano. It is in some places as deep as 180 feet, and is almost completely shut in by steep and wooded heights. The sulphureous and mephitic vapours arising from the lake were believed in ancient times to kill the birds that flew over it; hence, according to some, its Greek appellation. Owing to its gloomy and awful aspect, it became the centre of almost all the fables of the ancients respecting the world of shades. Here was located Homer's Nekyia, or entrance to the under world; here the Cimmerians are said to have dwelt—a people who lived in deep caverns, without ever coming into the light of day, explored metals, and imparted Stygian oracles; here also were placed the grove of Hecate and the grotto of the Cumean Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost much of its wildness; and by his orders Cocceius constructed the famous tunnel through the mountain to Cumæ, a work of comparative ease, considering that the hills round about are composed of volcanic tufa. The lake was also connected in ancient times with the Gulf of Baiæ.

AVERRHOA. See CARAMBOLA.

AVERRHOES, properly, Ibn Roshd, or more fully, Abul-Walid Mohammed-Ibn, Ahmed-Ibn, Mohammed-Ibn-Roshd, the most famous of the Arabian philosophers, was born at Cordova, in Spain, in 1149. His father, who was chief judge and mufti, instructed him in Mohammedan jurisprudence. In theology and philosophy, he had Thophail for his teacher; and in medicine, Ibn Zohr, the elder. His talents and acquirements made him be appointed successor to his father, and afterwards chief judge in the province of Mauritania. Being accused, out of envy, of a departure from the orthodox doctrines of Mohammedanism, he was dismissed from his office, and condemned by the ecclesiastical tribunal of Morocco to recant his heretical opinions, and do penance. After this, he returned to his native place, and lived in great poverty, until the Calif Almansor reinstated him in his offices, on which he went back to Morocco, where he died in 1198 or 1206. A. regarded Aristotle as the greatest of all philosophers. He translated and illustrated Aristotle's writings with great penetration; but the influence of the Alexandrine view laid down in the commentaries of Ammonius, Themistius, and others, is easily seen in his works, as in those of most of the Arabian philosophers. In opposition to the Arabian orthodox school, especially against Algazali, A. stood forth on the side of reason as the defender of philosophy. The Arabians called him, by way of eminence, the Expositor (of Aristotle), and his Syriac translation of Aristotle was held in the highest esteem among them. His writings are known to us only through Latin translations (Ven. 1489). His Commentaries on Aristotle appeared in an edition of that philosopher's works (11 vols. Ven. 1560). He also wrote a sort of medical system, which, under the name of *Colliget* (a corruption of the Arabic title *Kulliyat* i. e., 'The Total' system), was translated into Latin, and repeatedly printed (Ven. 1482 and 1514). The philosophy of A. attained to importance in the Christian Church as early as the 13th c., although his pantheistic doctrine of the unity of the active principle in the universe was often repudiated as an error, and astrology was characterised as Averrhoism.

AVERSA, a town in the province of Terra di Lavoro, in the former kingdom of Naples, is situated between Naples and Capua, in a beautiful district rich in oranges and wine. It is well built, with 16,000 inhabitants; has a cathedral, and a number of monasteries, in one of which, Andrew of Hungary, the Darnley of Neapolitan history, was murdered with the connivance of his wife, the beautiful but guilty Joanna, queen of Naples; an excellent asylum for the insane, established by Murat; and a foundling hospital. A. was built in 1029 by the Normans on a territory ceded to them by Duke Sergius of Naples, to be held in fief. About two miles from A., are still to be seen a few ruins of the Oscan city of Atella, famous as the birthplace of

the satirical farces so popular on the Roman stage.

A'VÉS. See Birds.

AVEYRON, a river and department in the south of France. The river rises near Severac-le-Château; flows, for the most part, in a westerly direction through the department of the same name; and, after a course of 90 miles, falls into the Tarn—a feeder of the Garonne—below Montauban. It touches in its course the towns of Rhodez, Villefranche, and Negrepelisse.—The department of A. has an area of 3402 square miles, and is one of the most mountainous parts of France. Situated between the highlands of Auvergne and the Cevennes, it slopes like a terrace south-west to the Garonne, to the basin of which the department belongs. The principal rivers flow through the department from east to west; and between these, several ramified offsets from the chain of the Cevennes traverse the country. The climate is healthy, but cold and raw, especially in the north and east. North of the Lot, only rye and oats are grown; in the rest of the valleys, other kinds of grain also thrive, as well as fruit, chestnuts, potatoes, and truffles. A third part of the land is unfit for cultivation, but affords excellent pasture for the numerous herds of cattle, goats, and sheep, which, along with the breeding of swine, form the principal resources of the mountaineers. 18,000 cwt. of cheese is sold yearly under the name of Roquefort cheese. The mineral wealth of the department is considerable. Coal, iron, lead, zinc, copper, vitriol, alum, and antimony are found in abundance, the mining, preparing, and sale of which form a principal means of support to the 402,474 inhabitants. Besides these, the principal employments are paper-making, cotton-spinning, tanning, the manufacture of woollen cloth and carpets, &c. The seat of the departmental courts is Rhodez, which is also a bishop's see.

A'VIARY, a place for keeping birds. The arrangements of an A. depend upon the habits of its inmates, the climate suited to them, and other circumstances. A bird-cage is a domestic aviary. Aviaries on the largest scale are to be seen in zoological gardens.

AVICE'NNA, properly, Ibn Sina, or more fully, Abu Ali Al-Hossein Ibn Abdallah Ibn Sina, a famous Arabian philosopher and physician, whose authority for many centuries passed for indisputable, was born 980, at Charmatain, a village near Bokhara, where he received a very learned education. He studied with special fondness mathematics, astronomy, philosophy, and medicine. He was physician to several of the Samanide and Dilemite sovereigns, and also for some time vizir in Hamadan, but afterwards retired to Ispahan, and died during a journey of the Emir Ala-ed-Daula to Hamadan, in 1037. He left a multitude of writings, among which his system of medicine, *Kanun fi 'l-Tibb*, acquired the greatest reputation. It is distinguished less by originality than by an intelligible arrangement and judicious selection from the writings of the Greek physicians, at a time when the knowledge of Greek was not widely spread. A. himself knew the Greek writers only through Arabic translations. The Arabic text of the *Kanun*, and of several of his philosophical writings, among which those on metaphysics especially attracted the attention of the schoolmen, appeared at Rome, 1593, in 2 vols. The *Kanun* was translated into Latin by Gerardus Cremonensis, and repeatedly printed (Ven. 1595, 2 vols.). His philosophical writings have also appeared several times in Latin translations (Ven. 1490, 1523, 1564).

AVICENNIA, a genus of plants of the natural order *Avicenniæ* or *Myporaceæ*, an order very nearly allied to *Verbenaceæ* (q. v.), and almost exclusively confined to the southern hemisphere. The genus *A.* consists of trees or large shrubs resembling mangroves, and, like them, growing in salt-swamps. Their creeping roots, often curving for the space of six feet above the mud before they stick into it, and the naked asparagus-like suckers which they throw up, have a singular appearance. *A. tomentosa*, the White Mangrove of Brazil, has cordate ovate leaves, downy beneath. Its bark is much used for tanning. A green resinous substance exuding from *A. resinifera* is eaten by the New Zealanders.—The genus is named in honour of the Arabian physician Avicenna.

AVI'CULA. See Pearl Oyster.

AVIGNON (*Avenio Cavarum*), a city of Provence, in the south of France, capital of the department of Vaucluse, is situated on the left bank of the Rhone, which is here crossed by a long bridge. The population is (1872) 27,409; the streets are narrow and crooked. There is a multitude of churches and religious establishments, among which the cathedral on the Rocher des Dons and the church of the Franciscans, as well as the old papal palace and the tower Glacière, are distinguished. The Dominican convent now serves as a cannon-foundry. The city is the see of an archbishop, has a museum and picture-gallery, and several other valuable institutions. The university, founded in 1303, was abolished in 1794. A. has manufactures of silk, silk-dyeing, tanning, iron-founding, &c., and is famous for its garden produce, its fruit, wine, honey, &c. The country about A. is delightful, and extremely fruitful in corn, wine, olives, oranges, and lemons.—In A., Petrarch spent several years; it was here he saw Laura, whose monument is to be found in the Franciscan church. Vaucluse, which he has immortalised, lies about three leagues from Avignon. A. was the capital of the ancient Cavares, and presents many remains of the times of the Romans. In the middle ages it formed, with the surrounding district, a county, which the popes, who had already received the county of Venaissin as a gift from King Philip III., bought in 1348 from Joanna, queen of Naples and Countess of Provence. The pope governed both counties through a vice-legate, and continued in possession of them till 1790, when, after many stormy and bloody scenes, the city with its [illegible] was united with France. At the peace of [illegible] (1797), the pope formally resigned A. [illegible] A. is celebrated in ecclesiastical [illegible] for a time, the residence of the [illegible] Philip IV. of France, Pope Cl[illegible] his successors from 1309 to 13[illegible] reside there. AVILA Y ZUNIGA, Don Luiz de, a Spanish diplomatist, and historian, born at Placencia, Estremadura, enjoyed the favour and confidence of Charles V., who intrusted him with embassies to Pope Paul IV. and Pius IV., and made him Commander of the order of Alcantara. He accompanied the emperor on his expeditions to Africa and against the princes of the league of Schmalkald, and wrote an account of the war which goes under that name, indeed, but able and spirited. The work entitled *de la Guerra de Alemaña hecha por Carlos V. en* 1546 *y* 1547, have been published repeatedly (first, Ven. 1548), and translated into various languages.—Avila, Gil Gonzalez de, born at Avila in Old Castile, in 1559, and died in 1658, was a Jesuit and canon of Salamanca; also royal historiographer for Castile and the Indies. He composed a great number of historical works, of which the following may be mentioned as containing many valuable facts: *Historia de la Vida y Hechos del Rey Henrique III. de Castilla* (Madr. 1638); *Historia de la Vida y Hechos del Monarca D. Juan III.* (in Mendoza's *Monarquia de España*, fol. 1770); *Historia de Salamanca* (Salam. 1606); and *Teatro Eclesiastico de la primitiva Iglesia de las Indias Occidentales* (2 vols. Madr. 1645–56).

AVIZ, an order of knighthood in Portugal, instituted by Sancho, the first king of Portugal, in imitation of the order of Calatrava, and having, like it, for its object the subjection of the Moors. By the present usage, the king of Portugal, who is grand-master of all of them, wears decorations of the first three orders of Portugal those of Christ, St James, and Aviz united in one medal, divided into three equal spaces.

Order of Aviz.

AVOCA, or **OVOCA** (Celt. meeting of the waters), a small … the south-east of Wicklow county, formed by the union of two streams, rising in the hills of the centre of the county. The A. runs through a picturesque vale only a quarter of a mile wide, with wooded banks 300 to 500 feet high, and after a course of nine miles, reaches the sea at Arklow. A. Vale is celebrated in Moore's *Irish Melodies*.

AVOCADO PEAR, or **ALLIGATOR PEAR** (*Persea gratissima*), a fruit-tree of the natural order *Laurineæ* (q. v.), a native of the warm parts of America. It attains the height of 30–70 feet, and is a slender tree with a dome-like top. The leaves resemble those of the laurel. The flowers are small and produced towards the extremities of the branches. The fruit is a drupe, but in size and form resembles a large pear; is usually of a brown colour and has a soft green or yellowish pulp, not sweet, but of a delicate flavour, which dissolves like butter on the tongue, and is believed to consist chiefly of a fixed oil. It is called *vegetable butter*

in some of the French colonies. It is much esteemed in the West Indies, and often eaten with sugar and lime-juice or wine, or with spices.

AVOCET, or **AVOSET** (*Recurvirostra*), a genus of birds, which, although having the feet webbed nearly to the end of the toes, is usually ranked among the *Grallæ* or *Grallatores*, upon account of the length of the legs, the half-naked thighs, the long, slender, elastic bill, and the general agreement in habits with snipes. They are distinguished from all other birds, except a few species of humming-bird, by the strong upward curvature of the bill, which is much like a thin piece of elastic whalebone, and most probably a delicate organ of touch, adapted for seeking food in mud, as their webbed feet are for walking upon it, and their long legs for wading in the fens and marshes which they frequent. They are birds of powerful wing. They are not much addicted to swimming. They scoop through the

Avocet.

mud with the bill, first to one side, and then to the other, in quest of worms and other small animals; although Audubon has also observed the American A. taking insects which were swimming on the surface of the water, and expertly catching them in the air, running after them with partially expanded wings. - The Common A. (*R. Avocetta*), the body of which is about as large as that of a lapwing, is found in the fenny districts of England, where, however, it is much more rare than it once was, and is a native also of the continents of Europe, Asia, and Africa, occurring even at the Cape of Good Hope.—Other species are natives of North America, India, and New Holland.—The American A. (*R. Americana*) has the bill less recurved than the Common A., but its habits appear to be very similar.

AVOIDANCE, in English ecclesiastical law, the term by which the vacancy of a benefice, or the fact of its being *void* of an incumbent, is signified. A. is opposed to *plenarty*, or fulness. See Benefice.

AVOIRDUPOIS, or **AVERDUPOIS**, is the name given to the system of weights and measures applied in Great Britain and Ireland to all goods except the precious metals and precious stones. The word is generally said to be derived from the French *avoir du pois*, to have weight; but the middle-age Latin word *averia* for *avera*, used for goods in general, or the middle-age Latin *averare*, and French *avérer*, meaning to *verify*, seem to offer more probable etymologies.

The grain is the foundation of the Avoirdupois system, as well as of the Troy. A cubic inch of water weighs 252·458 grains. Of the grains so determined, 7000 make a pound A., and 5760 a pound Troy. See Weights and Measures.—The A. pound is divided into 16 ounces, and the ounce into 16 drams. A dram, therefore, contains 27$\frac{11}{32}$ grains, and an ounce 437$\frac{1}{2}$ grains.

TABLE OF AVOIRDUPOIS WEIGHT.

27$\frac{11}{32}$ grains	. are	1 dram,	1 dr.
16 drams or drachms	"	1 ounce,	1 oz.
16 ounces . .	"	1 pound,	1 lb.
28 pounds . .	"	1 quarter,	1 qr.
4 quarters . .	"	1 hundredweight,	1 cwt.
20 hundredweight	"	1 ton,	1 ton.

A cubic foot of water weighs 997·14 ounces A., or nearly 1000 ounces, which gives an easy rule for determining the weight of a cubic foot of any substance from its specific gravity. A. is the weight used in the United States of North America, where, however, in many places, the cwt. contains only 100 lb., and the ton, 2000 lb.

A'VON, a word of British or Celtic origin, meaning 'river' or 'stream,' which seems allied to Aa (q.v.), the name of so many continental rivers. It is the name of several of the smaller British rivers. Of these may be noticed: 1. The Upper or Warwickshire A., which rises in north-west Northamptonshire, runs south-west through Warwickshire and Worcestershire, passing Rugby, Warwick, Stratford, and Evesham, and joining the Severn at Tewkesbury. It has a course of 100 miles, and receives several tributaries. 2. The Lower, or Bristol, or West A., which rises in north-west Wiltshire, and runs 70 or 80 miles, first south in Wiltshire, and then west and north-west between Gloucestershire and Somersetshire. It traverses an oolitic basin, passing Bradford, Bath, and Bristol, and empties itself into the Bristol Channel. It is navigable for large vessels up to Bristol. It runs generally between deep banks in a rich valley. A canal through the middle of Wiltshire connects it with the Thames. 3. The Wiltshire and Hampshire, or East A., which rises in the middle of Wiltshire, and runs south 70 miles through Wiltshire and Hampshire, passing Amesbury, Salisbury, and Ringwood, and entering the English Channel at Christchurch. It is navigable up to Salisbury. It abounds in the small delicate loach. In Wales two rivers named A.—one rising in Monmouthshire, the other in Glamorganshire—fall into Swansea Bay. In Scotland there are several of the same name, affluents of the Spey, Annan, Clyde, and Forth.

AVRANCHES, a town of France in the dep. of Manche (q. v.).

AWE, Loch, a lake in the centre of Argyleshire, extending in a direction north-east and south-west about 24 miles, with an average breadth of from half a mile to 2½ miles. It rarely freezes, and its surface is 108 feet above the sea. The country around consists of mica slate. The scenery is most striking at the north-east end of the lake, where the water is studded with numerous wooded islets, overshadowed by towering and rugged mountains, prominent among which rises the dark and rocky ridge of Ben Cruachan, 3669 feet high, and 14 miles in circuit. Of the islands, the most noted is Fraochcilean, containing the remains of a castle granted to Gilbert M'Naughton in 1267 by Alexander III. On a peninsula, in the north end of the lake, stands Kilchurn Castle (Caisteal Chaoil-chuirn), once a fortress of great strength, built about 1440 by Sir Colin Campbell of Glenorchy, and garrisoned, as late as 1745, by the king's troops. The waters of the lake are carried off at its north-west end by the river Awe, which, after a course of 7 miles, enters the sea at Bunawe on Loch Etive. The magnificent 'Pass of Awe,' through which the road runs beneath the shoulder of Ben Cruachan, was the scene of a conflict, in 1308, between Robert the Bruce and the M'Dougalls of Lorn, in which that clan was all but exterminated. At the north-east end of the loch, it receives the waters of the Orchy and Strae, flowing through glens of their own names. Loch A. abounds in fine fish, especially trout and salmon; and the small village of Claddich, on the east side of the loch, due north of Inverary, is the general resort of anglers.

A-WEA'THER is a term denoting the position of the helm when jammed close to the weather-side of a ship; it is the reverse of *a-lee*.

A-WEI'GH, as applied to the position of an anchor, when just loosened from the ground, and hanging vertically in the water, is nearly equivalent to *a-trip*.

AWN (*Arista*), in the flowers of Grasses, a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely *awnless;* in many, the glumes alone are *awned* (or *aristate*), or only one of them; in others, the glumes are awnless, and the paleæ, or one palea, awned. The awn is often terminal, and appears as a prolongation of the midrib of the glume or palea; from which, however, it sometimes separates below the point, and is then said to be on the back of it, or *dorsal;* sometimes it is jointed at the base, and finally separates at the joint; sometimes it is knee-bent or geniculate; sometimes it is twisted, and liable to twist and untwist hygrometrically; sometimes it is rough, or even serrate, at the edges, as in barley; sometimes it is feathery, as in feather-grass (*Stipa*), which also is remarkable for the great length of its awn. The characters of genera and species are often derived from it, but it is not always invariable, even in the same species, and the cultivated varieties of wheat and oats differ much in being more or less *bearded*. There appears to be a tendency to the diminution or disappearance of the awn through cultivation.

AXE, the name of two small rivers in the south-west of England. One rises in the Mendip Hills, north of Somerset, runs first south-west, and then north-east, through a carboniferous limestone, trias, and diluvial basin, past Wells and Axbridge, into the Bristol Channel. The other rises in west Dorset, and flows 21 miles south and south-west, through east Devonshire, in an oolitic and trias basin, past Axminster into the English Channel. A. is only another form of Exe. See AA.

A'XEL, or A'BSALON, Archbishop of Lund, in Denmark, and also minister and general of King Waldemar I., was born in 1128, and died 1201. He was descended of a distinguished family, and, in his youth, studied at Paris. A. distinguished himself as well by wisdom and uprightness in peace, as by valour and address in war. The Wendish pirates were not only driven from the coasts of Denmark, but attacked in their own settlements, and subdued. He defeated the Pomeranian prince, Bogislav, and made him dependent on Denmark. In the wise legislation of Waldemar and of his son, he took a great part. He favoured and promoted learning and art, and to his encouragement we owe the first connected history of Denmark by Saxo Grammaticus. By building a fortified castle for defence against the pirates, he laid the foundation of the future great city of Copenhagen, which was then an insignificant village, inhabited only by fishermen. Owing to this origin, Copenhagen has sometimes got the name of Axelstadt. A. lies buried in the church of Sora, where he had founded a monastery. The relics found when his grave was opened in 1827, the chief of which were a bishop's staff and ring, are described in the latest complete biography of A. by Estrup, translated into German by Mohnike in Illgen's *Zeitschrift fur Historische Theologie* (2 vols. Leip. 1832).

ſONE, a mineral generally regarded as a Nephrite (q. v.). It is of a greenish colour, r less translucent, hard, tough, and not ten. It occurs in primitive rocks, always nd is found in Saxony, in Greenland, lew Zealand and other islands of the Pacific. It derives its name from the use to s put by the natives of these islands for eir hatchets. They also make car-drops

LME ISLE (A. Sax. *holme*, a river-isle), a ract in the north of Nottinghamshire, sur- y rivers—the Trent on the east; Don, north Torne and Idle, on the west; and Vicar- reen the Trent and Idle on the south. This miles from north to south, and 5 on an ast and west, was anciently a forest, but became a marsh. The marsh was drained rent in 1634 by Vermuyden, a Dutchman, ars' labour, and at the cost of £56,000. med land became very fertile under Dutch ch Protestant settlers, and after much it was, in 1691, divided, the original s receiving 10,552 acres, and the settlers the land are raised abundant crops of s, rye, pease, beans, clover, flax, rape, atoes, and onions. Peat and turf fuel nd valuable gypsum beds occur. The rackish, too hard for washing, and curdles n boiled with it. A. I. includes seven There are two small towns, Crowle and

(*axilla*), in Botany, the angle between the of a leaf and the stem or branch from rows. Buds usually grow in the axils of hough they are not always actually devel- a bud may be made to appear in such a and to form a new shoot or branch, by neans, which direct the strength of the s particularly to that quarter, as cutting main stem, wounding it above the place new branch is desired, &c. Flowers or ks (*pedunculi*) growing from the axils of called *axillary*.

OMANCY (Gr. *axine*, an axe, and *manteia*,), a mode of divination much practised by t Greeks, particularly with the view of the perpetrators of great crimes. An oised upon a stake, and was supposed to to indicate the guilty person; or the names al persons being pronounced, the motion at a particular name was accepted as guilt. Another method of A. was by the movements of an agate placed upon axe. This is only one of a multitude of modes of divination practised in all among all nations. See DIVINATION, and ROD.

a Greek word meaning a *board* or , as commonly used to signify a general , which the understanding recognises as on as the import of the words conveying hended. Such a proposition is therefore vetly, and does not need to be deduced other. Of this kind, for example, are ations whose predicate is a property to our notion of the subject. Every ence requires such fundamental propo- on which all the truths composing it d; the whole of geometry, for instance, mparatively, a very few axioms. Whether for the whole of human knowledge, absolutely first A., from which all else own may be deduced, is a question that ises to much disputation; but the fact, that human knowledge may have various starting-points, answers it in the negative. Mathematicians use the word A. to denote those propositions which they must assume as known from some other source than deductive reasoning, and employ in proving all the other truths of the science. The rigour of method requires that no more be assumed than are absolutely necessary. Every self-evident proposition, therefore, is not an A. in this sense, though, of course, it is desirable that every A. be self-evident; thus, Euclid rests the whole of geometry on fifteen assumptions, but he proves propositions that are at least as self-evident as some that he takes for granted. That 'any two sides of a triangle are greater than the third,' is as self-evident as that 'all right angles are equal to one another,' and much more so than his assumption about parallels, which, it has been remarked, is neither self-evident nor even easily made evident. See PARALLELS. Euclid's assumptions are divided into three 'postulates' or demands, and twelve 'common notions'—the term A. is of later introduction. The distinction between axioms and postulates is usually stated in this way: an A. is 'a theorem granted without demonstration;' a postulate is 'a problem granted without construction'—as, To draw a straight line between two given points.

AXIS, in Geometry.—The A. of a curved line is formed by a right line dividing the curve into two symmetrical parts, so that the part on one side exactly corresponds with that on the other; as in the parabola, the ellipse, and the hyperbola. The A. of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it: in this sense, we speak of the A. of a cylinder, a globe, or a spheroid. By the A. of rotation, we understand the right line around which a body revolves. In physical science, the A. of a *lens* is the right line passing through it in such a manner as to be perpendicular to both sides of it; and the A. of a telescope is a right line which passes through the centres of all the glasses in the tube. The A. of the *eye* is the right line passing through the centres of the pupil and the crystalline lens.

AXIS, in Botany, a term applied to the central part both above and below ground, around which the whole plant is regarded as arranged. The stem is called the *ascending A.*; the root, the *descending axis*. The opposite tendencies of growth appear as soon as a seed begins to germinate, in the radicle and plumule; the former of which is the descending A., and the latter the ascending A.; the former descending deeper into the soil, the latter ascending towards the air and light. That part of the stem around which the flowers are arranged is called the *floral* A., and, in describing some kinds of inflorescence, the terms, *primary floral* A., *secondary floral* A., &c., are occasionally employed.

AXIS (*Cervus Axis*), a species of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the Eastern Archipelago. It was known to the ancients by the name Axis. One of its Indian names is Chittra, and by British sportsmen in India it is generally called the Spotted Hog-deer. By some naturalists, it has been made the type of a genus of *Cervidæ*, called *Axis*. The A. has a great resemblance in size and colouring to the European fallow-deer; it is generally of a rich fawn colour, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns, however, differ very much from those of the fallow-deer, being slender, sharp-pointed, little branched, and not at all palmated. The female has no horns. The A. frequents thick jungles in the

vicinity of water, and feeds during the night. It is commonly found in herds of 15 or 20, of which 3 or 4 are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within shot. The males, however, sometimes exhibit great courage in defence of the young. It is very easily domesticated, is very gentle in its manners, has been frequently imported into Europe, and breeds freely in the parks in which it is kept at a few noblemen's and gentlemen's seats in Britain and France.

A'XMINSTER, a small town in east Devonshire, on the side of a little hill on the left bank of the Axe. Pop. in 1871, 2861. A. was once famous for the manufacture of Turkey and Persian carpets, which were little inferior to those imported. Two celebrated geologists have been connected with A.: Dr Buckland was brought up here, and Dr Conybeare was lord of the manor, and vicar.

A'XMOUTH, a village at the mouth of the Axe, east Devonshire. A mile east of A. occurred, in 1839, a landslip; an area 200 feet wide, for three-quarters of a mile parallel to the shore, having sunk 250 feet below the sea, with a great noise. The chasm thus formed became a lagoon, while the neighbouring sea-bed rose 40 feet. Rather more than a mile further east, occurred another but smaller landslip in 1840. The district around consists of greensand strata.

A'XOLOTL (*Gyrinus*, or *Axolotl*, or *Axolotes edulis*), a remarkable animal, found in great abundance in some of the Mexican lakes, and particularly in the Lake of Mexico itself. It is a Batrachian (q. v.) reptile of the family of the *Proteida* or *Perennibranchiate Batrachians*, in which the gills remain during life, and the lungs are never sufficiently developed to maintain respiration by themselves. It is in general form very like a fish; has a large

Axolotl.

and broad head; and tapers into a long compressed tail, which has a thin membranous fin both on its upper and its lower side. It has four legs, with toes not webbed; and on each side of the neck the gills form three long branched or feathered processes, which give it a very remarkable appearance. It is brown, and mottled with small black spots. When full grown, it is 8 or 9 inches in length. It is esteemed a great delicacy in Mexico, and is there constantly brought to the market.
